Asia.—Turning now to Asia, the most remarkable finds of early *Homo sapiens* come from the Upper Cave at Chou Kou Tien (where Pekin Man was discovered). One of the skeletons, an elderly man, is very like the "Old Man of Cro-Magnon." A skull from Niah Cave in Sarawak dated to 40,000 B.C. is the earliest known representative of *Homo sapiens* in Asia. In Java the descendants of Solo Man may be represented by the Wadjak people probably dating from around 8000 B.C., who bear a striking resemblance to the Australian aborigines. They may be roughly contemporary with a skull from Keilor near Melbourne which proves that Australia was populated in late Pleistocene or early post-Pleistocene times.

America.—The question of the date of the first peopling of the New World is very controversial; in nearly every case the geological evidence for the association of early human remains has been questioned. It seems that the first immigrants from Asia crossed the Behring Straits before the end of the Ice Age, perhaps about 15,000 B.C. They are believed to have been of an "archaic White" strain, something like the modern Ainu and Australian aborigines, and probably similar to the "old man" of the Upper Cave at Chou Kou Tien. Later immigrants were fully Mongoloid, and it seems that a mixture of these two strains gave rise to the American Indian.

The End of the Old Stone Age.—From this brief review of developments all over the world, we must return to the Upper Palaeolithic in Western Europe. We left the Cro-Magnons with their Aurignacian culture during the second cold phase of the Last Glaciation. During the time of the main advance of the ice sheets, about 18,000 B.C., the Aurignacian culture died out and was replaced first by the Solutrian and then by the Magdalenian cultures. The Magdalenians are renowned for their very fine working of bone and antler, particularly in the form of barbed harpoons, and for their artistic skill. In many ways their

paintings of animals, such as those in the cave of Lascaux, surpass the ones of the Aurignacian period. As the Ice Age drew to a close, however, the Magdalenians disappeared, and with them the great flowering of Upper Palaeolithic art also died out.

Up till the end of the Ice Age, Palaeolithic people must have lived in essentially the same way all over the world. They were hunters and food-gatherers, living in small bands as the Bushmen and Australian aborigines do today. Within these small, isolated groups, certain mutations must have arisen which were advantageous in particular environments. These would have been encouraged by natural selection, thus leading to the differentiation of distinct races in different localities.

After the ice finally retreated about 8000 B.C. the way of life of people in Europe must have changed considerably. The great herds of cold-loving animals upon which Palaeolithic hunters depended for their food either became extinct or retreated as forests began to spread over the open country of former times. The Mesolithic people—living after the end of the Pleistocene and before the Neolithic stage—had to rely increasingly on fishing and collecting shell-fish to supplement their diet.

Outside the areas affected by the ice, however, certain progressive people gave up their nomadic existence and began to live in settled communities. In Palestine and other parts of the Middle East wild wheat and barley grew and there were herds of wild goats and sheep. The Mesolithic Natufians reaped these grasses and cereals and domesticated the dog to help in hunting. It was they who led the way to events which were to revolutionise Neolithic Man's way of life: agriculture and stock-keeping.

ENVIRONMENT AND CULTURE.

It is clear that no people could enter a Bronze or Iron Age unless bronze and iron were, in fact, available in their environment. Hence the Eskimos, who have no metals available to make into weapons or ornaments, still use stone, ivory (from walrus tusks), and bone. In short, their environment does not permit a higher degree of culture. The primitive races or "backward" peoples have evolved ways of life which are often well adapted to the environments in which they live. The second point is that great advances are made only upon the foundations erected by others. The quantum theory and the theory of relativity could not have been evolved by the scientists of ancient Greece or by Galileo or Newton, not because they were less intelligent than Einstein, but because every innovator can progress only a little beyond what he had received from his predecessors in many different lands and times. The house of science is not built top floor first, but slowly upon the foundations laid by earlier thinkers. "Civilisation" is not such a simple concept as we once supposed, and technological advance does not necessarily imply high moral standards. Scientists are agreed that there are no significant intellectual differences between any of the races in existence today, and that the reason why some peoples are relatively backward is either because the raw materials necessary for technological advance have been lacking in their environment, or because by a historical accident their country has been out of contact with the general flow of civilisation, so that the spread of new ideas did not reach within their boundaries. *See also* Q14(2).

Definition of Terms.—Anthropologists are agreed that, although it may be quite correct to speak of "national character," we cannot explain this in terms of race or heredity. The true explanation is that such traits are cultural rather than biological in origin, and, since the "culture concept" is immensely important in modern social science, we must first of all define our terms:

> A *society* is a group of people who live and work together, regarding themselves as members of the group, and feeling towards it an emotion best described as "belonging."

> A *culture* is the way of life followed by such a group—that is to say, its written or unwritten laws, its religious beliefs, its ideals, its art, technology, and even its pots and pans.

Without written records we are left to deduce the record of prehistoric man by the culture to which he belonged—Azilian, Magdalenian, Acheulian, and so on—and here the archaeologist, who knows very little of the ideals and religious beliefs or laws of these bygone peoples is generally thinking in terms of their *material* culture, which includes objects found during excavations such as pots and pans, knives, weapons, needles, and ornaments. But when we talk of culture in relation to present-day peoples, we are more often thinking of the way of life of the group—its ideals, incentives, and unwritten laws. Culture is what has been described as the "cake of custom," and its importance lies in the fact that it is the cement which binds the members of a group into a living organism.

Sub-Cultures.—All of us are members, not of one group only, but of many, and each group, however small, has a culture of its own, a way of life to which we must conform if we wish to retain group membership or, at any rate, the respect of the other members. As an example, let us take an imaginary individual with the name of George Campbell, who happens to be a Lowland Scot, a Presbyterian, a socialist, a coal-miner working at the coal-face in a particular pit, a pigeon-fancier, and a follower of Newcastle United football team. The interesting thing is that, knowing these facts, we already know a great deal about Mr. Campbell; for we can be sure that his membership of these groups (national, religious, political, sporting, and so on) will strongly influence his behaviour. One of the serious defects of classical psychology and of much popular thought is that it failed to notice how much of the individual's day-to-day behaviour arises, not from the depths of his unconscious or from what is ordinarily described as his "character," but simply from his need to conform to the, often unwritten, rules of his membership groups. If anyone suggested to our Mr. Campbell that he was not an entirely free agent, that he was not as independent as he prides himself on being, he would, no doubt, be very annoyed. Nevertheless, this is merely a commonplace statement of fact. Campbell has all the prejudices of the Lowland Scot—he thinks that education is a "grand thing," that Roman Catholics are a dangerous and superstitious sect, that the English are a somewhat inferior nation over the Border who regrettably lack stamina and intelligence, and that money, although the root of all evil, is a good thing to have and be careful about. But, had he been born in the South of Italy, he would have regarded education as the exclusive possession of wealthy landowners, Catholicism as the only true religion, the English would have meant little to him at all (until the last war), and his goods would be exchanged by barter rather than money. Mr. Campbell enjoys his morning porridge and bacon and eggs, but his enjoyment of them is only a prejudice learned in childhood and his opposite numbers in Africa and France enjoy locusts, frog's legs, and snails, which it has never struck him to regard as "food" at all. His grandfather might have worn a beard, but if Campbell came to work wearing one, he might find himself in difficulties; this is one of the many quite innocuous things which are "not done" in certain groups. Campbell might, on special occasions, wear a kilt, but Mr. Smith over the Border would find himself under considerable social pressure to stop doing so if he ever had the temerity to start. There is no law saying that Scots or Englishmen may not strip to the waist in a hot cinema or theatre, but they do not do so, although a miner may do so at work and other people at the seaside. In short, Mr. Campbell, like the rest of us, is for the most part a creature of custom.

Approved Patterns of Conduct.—If we take the usual analogy of the clay, the potter, and the de-

sign, then it will be seen that the newborn child (the clay) is modelled by the parents (the potter), not at random, but according to the approved pattern of a particular society (the design). Everyone, into whatever society he is born, is brought up to have specific attitudes to women or men, to sexual relations, to cleanliness, to aggressiveness, and to competition, and these attitudes are unique to each society at any given time. Most middle-class Englishmen feel that they ought to "get on" and have ambitions, that one should not strike a woman, that one ought to have a daily bath, and that it is rude to argue in public with shopkeepers, waiters, and public servants. Frenchmen and Italians have no such inhibitions about arguing in public, and Americans have a much stronger desire to succeed. Such differences in national or class character may often cause difficulties through misunderstanding. For example, the average British worker attaches more importance to sticking together with his mates than to getting on, and he rather despises the middle-class attitude that one must succeed at all costs, regardless of whom one has to overcome in order to get there. Then the average American is brought up to feel that when he has made more money than someone else, he should be proud of his achievement and make no secret of his opulence, however temporary, while on the other hand the Englishman feels that it is impolite to discuss money or speak of one's achievements. Therefore to the American the Englishman is a queer, reticent, and "stodgy" individual; to the Englishman the American is noisy and boastful. Neither accusation is true —both are judging each other in terms of how they have been taught people ought to behave.

Interaction of Group Influences.—Although we have so far spoken of the national character of such large groups as the British, American, French, and Italians, it is obvious that when dealing with groups of this size composed of many subgroups, the resulting picture will be far from clear. Our Mr. Campbell is, to the foreigner, simply "British," but he is, as we have seen, also a Scot, a Protestant, a member of the working-class, and a miner. So, although he shows many traits which are "British" in the widest sense, he differs in obvious ways from another Britisher who was born in London, is of the middle class, belongs to the Church of England, and works as an accountant. It is not only national, but also regional, religious, class, and occupational groups which influence personality, and there are other factors also at work which we must shortly discuss. Before doing so, however, the reader is asked to turn to Section Q, Part II, where a brief account is given of the researches of Ruth Benedict and Margaret Mead into the cultural ideals of various primitive societies. Primitive peoples are more suited to anthropological studies, because, in the first place, they can be separated into small tribal communities which are, for the most part, not subdivided into regional, class, or religious subgroups. Secondly, they are much less subject to social change, and have remained closely integrated, undivided, and in varying degrees static for considerable periods of time.

Individual Differences.—Now, as we can readily observe, individuals differ quite considerably from each other, even within the same social group, so we must now consider what factors give rise to the individual variations upon the theme set by culture; several, in fact, have already been mentioned. These are, the subgroups to which the individual belongs, his status and role, and his particular upbringing and inheritance. Social change, too, gradually brings about changes in the "basic personality type" of a society, as, for example, the changes in the Englishman's attitude to, say, music and sport which took place between Elizabethan and Victorian times.

1. *The Influence of Subgroups* in bringing about particular attitudes in the individual has already been discussed, and need not be further elaborated here.

2. *Status and Role.*—An individual's status is his position in society, not only in respect of social class, but also in occupational, marital, professional, and other spheres. His role is the behaviour which is associated in that society with a given status. Perhaps these concepts are most simply explained if we regard social life as a sort of stage-play in which each individual is an actor in particular roles: a parson has to act as a parson, a doctor as a doctor, a father as a father, and a manager as a manager. Parsons are expected to talk and dress in a particular manner, fathers to behave in a certain way (which differs in each society), and although every parson or father is an individual in his own right, many of his acts can be understood only when we realise that he is acting in the way society expects of parsons and fathers. When people break these unwritten rules, difficulties may arise. There is no law which says that a parson may not play the saxophone, but one who did would be looked on somewhat askance by his parishioners, and, although patients sometimes complain that their physician puts on an exaggerated "bed-side manner," they are often even more distressed when he does not. Gordon Rattray Taylor tells of a factory manager who went about in a shabby old car, and who, far from being thought endearing and democratic for doing so, was regarded with disapproval by the workers, who felt that he was "letting down the side" by not behaving in a manner appropriate to his position. This is what is described as "*formal status,*" since managers, parsons, fathers, and so on, occupy formal positions recognised by society as at present constituted. There is also *informal* status—that is to say, the type of status allotted to individuals in a small and intimate group such as the working group in the factory. For example, we have George, who is the one who defies management and takes the lead when complaints are to be made; Alf, the one who tells dubious funny stories; Bill, the one who knows all about First Aid; and Harry, the amiable idiot who is always teased by group members but protected from the jibes of the members of other groups. All these individuals have been allotted a certain informal status, and are supposed to act "in character," although each man in another group may play a quite different role. Alf, the joker, may be henpecked at home—a sad little man; Bill, the knowledgeable First Aider, may be a very insignificant member of the local St. John's Ambulance Brigade, to whom he may be the "silly ass"; George, the resentful, may be the kindly father. But within each group their roles are fixed and difficult to evade. Status and role, therefore, have a powerful influence upon behaviour.

3. *Differences due to Upbringing and Heredity.*—Although the influence of heredity, so far as personality is concerned, has been grossly exaggerated, it does indeed play some part. What is inherited, however, is not specific behaviour but temperament, and temperamental differences, being based on glandular and structural nervous factors, are fairly permanent features of the personality. By and large, upbringing determines *what* we do, temperament *how* we do it.

The most important differences between one individual and another in the same culture arise from the vagaries of upbringing; for, even apart from such accidents of fate as the loss of one or both parents, illness in childhood, and natural calamities, the obvious fact is that no parents ever pass on the cultural design to their children without many individual variations. If we picture the cultural design as a rough mould which supplies the main outlines of the pattern, we can also picture the parents as adding individual touches of their own (whether knowingly or otherwise) to a material which already varies for biological reasons. At this point it is necessary to say something of the work of Freud, for it is he who has given us some of our closest insights into what one might describe as the microscopic anatomy of the individual personality. Unfortunately to do so is by no means easy because Freudian theory is extremely complex, and has, furthermore, been considerably modified by later writers of the psycho-analytic school. What is given here must be taken only as a very rough outline of what Freud and later psycho-analysts have been trying to say

FREUDIAN THEORY.

The newborn child is a young animal, with no morals or sense of reality and no " instincts " as we understand the term in the lower animals. It has only two great drives which Freud takes to be fundamental—sex and aggression. Although Freud described sex and aggression as " instincts," the word is nowadays reserved for a particular form of behaviour which, if it exists at all in man, is certainly a dying category—it should be used solely for behaviour which is inborn, relatively fixed, and automatic. Ants, bees, and wasps, for example, carry out the most detailed acts; nest-building, caring for the grubs, or food-collecting and storing; but there can be no doubt at all that none of these acts is in any way intelligent. They are based on the insect's nervous structure, and could not occur otherwise than they do. Among the higher animals, the birds and mammals, such instinctual behaviour comes to be increasingly modified by intelligence, but it is only in man that intelligence assumes its full significance, and all behaviour is modifiable and no longer automatic. The drives of sex and aggression in man do not involve any elaborate type of fixed behaviour pattern; they are simply the raw material of action, to be modified in many different ways as the child learns from its parents and others. Briefly, all animals in varying degrees (more so in the lower animals, less so among the higher) are like tram-cars moving upon fixed rails, and however complex the route they take, it is largely what has been laid down from the beginning. Human beings, on the other hand, are like motor cars, which, although making use of the same source of energy as the animals, can utilise it to drive where they please.

Sex.—Freud used the word sex in a rather specialised sense to apply, not only to sexual behaviour in the ordinary meaning of the word, but also to such behaviour as eating and drinking, excretion, and, at a higher level, to love and friendship. It might almost be said that in Freudian terminology sex and aggression are words used to describe the two poles of desire, positive (love, lust, hunger, longing, wanting) and negative (hating, fearing, avoiding, killing, getting rid of things).

The Id.—The problem of society is to modify this primitive creature which can only need and desire, hate or fear, want pleasure and avoid pain, into a civilised being, and this is the problem it delegates to the parents, who, in the long run, utilise the child's need for security or protection and care to compel it to act in approved ways. The baby learns, by imitation, by trial and error, by punishment or the threat of punishment, by love or fear of the loss of love, to conform more or less to social standards. The primitive aspect of the mind, which includes not only the innate drives of sex and aggression but also all those thoughts and emotions which, in the course of development, the individual comes to accept as forbidden, is described as the Id, and just because it contains this sort of material, thoughts and emotions within it become or remain unconscious.

When the infant is born, its mind is all Id, but sooner or later the child is confronted by stern reality when it comes to realise that desires are not satisfied automatically. Sometimes it is hungry and food is not forthcoming, sometimes it is wet and uncomfortable and has to wait to be " changed "—all these events occur even to the most fortunate baby.

The Ego.—So a part of the mind comes to be separated off from the primitive Id, whose function it is to deal with reality, and this part is known as the Ego—the conscious mind as we know it in adult life. The basic function of the Ego is to deal with life as it really is, not as we should like it to be.

The Superego.—Still later, perhaps about the age of three or four, the child is faced by another problem; for it has to start conforming to the ethical dictates of society, to what is ordinarily described as the moral code. It has to learn what is done and what must not be done, and so a further division in the mind takes place and part of the mind begins to specialise in moral control. This part is known as the Superego. The Superego arises in two distinct stages—firstly, the child comes to realise that under penalty of punishment or disapproval, it must obey its parents; at this stage, then, compulsion comes from outside. Later, however, the child by a process of what Freud describes as " introjection " takes the parental standards within itself. One part of the mind, as it were, plays the role of the moral parent in relation to the rest. This is the fully-fledged Superego.

Character.—An individual's character is the result of a three-cornered struggle between the primitive biological drives (represented by the Id), the hard facts of reality (represented by the Ego), and the moral dictates of society (represented by the Superego). The Superego is the censor which forbids thoughts or actions not allowed by society or, more accurately, thoughts or actions which were forbidden by the parents in early childhood. As one writer says, the Superego is a sort of psychological gyroscope which places control within the mind and avoids, in varying degrees, the need for outward compulsion. When the dictates of the Superego are transgressed the individual has a sense of guilt and feels himself more or less a social outcast.

Expression of Primitive Impulses.—But the primitive drives are very powerful and cannot be totally repressed—they demand some sort of outlet, and are given it on condition that they are suitably modified or appear in socially acceptable forms or at least at socially acceptable times. Most societies, for example, permit the expression of primitive emotion at certain periods or under certain conditions; the sexual drive is permitted expression in marriage, and naked aggression in warfare. But more often the drives have to be modified by one or other of two fundamental mechanisms known as reaction formation and sublimation. In the case of reaction formation the energy of the forbidden impulse is utilised in emphasising its opposite; it is as if the individual were saying: " Of course I don't have such wicked desires—you can see I am quite another sort of person." Perhaps this mechanism will become clearer if we give some examples.

(1) Even the layman is aware that people who are excessively puritanical are frequently by their very puritanism demonstrating quite the contrary aspects of their character. We laugh at the elderly lady who is afraid of finding a man under her bed precisely because we are aware consciously or unconsciously, that she would not have the fear if she did not also have the hope. Similarly, when we read in the papers of a gentleman who so disapproves of obscene books or magazines that he buys hundreds of them to find out whether they are suitable or not for others to read, we may suspect that his own motives are not entirely devoid of suspicion. In short, the character-trait of puritanism is sometimes a reaction formation against strong sexual desires; the individual is fighting in the outer world the very problem he is unable to deal with in his own mind. *See also* **The Nature of Aggression, Q7.**

(2) The second method of dealing with primitive impulses is by sublimation—that is to say, by making them socially useful. A butcher, a surgeon, or a prize-fighter are all expressing in modified form their latent sadism, but in a way which is recognised by society. Women who have wanted children and failed to have them may become teachers, helpers in nursery schools, and so on in a valuable attempt to satisfy a frustrated need. If Freud is correct, the frustrated sexual curiosity of childhood may later take the form of a desire to know, causing the individual to become a scientist or a bookworm. Art, sculpture, and painting may all be sublimations of the infant's natural dirtiness and pleasure in messing about

with mud, water, or even *its* own excretions. The reader may or may not accept these latter assumptions, but it is only fair to say that those who are in a position to know have found a great deal to support Freud's theories.

Mental Mechanisms.—Even in adult life the individual's adjustment to reality—the "hard facts of life"—and to moral problems is never complete, and self-deception is common. In this connection Freud describes various mental mechanisms which even those who do not accept the Freudian theory in its entirety have found valuable in understanding human behaviour. We will conclude, therefore, by describing some of these forms of self-deception here and giving examples of their influence upon human behaviour.

1. *Displacement.*—An emotion, when conditions do not permit its being directed towards a particular object, may be directed against another which originally had nothing to do with it. "Love on the rebound" is an example of this in which, when the original object of love has disappeared, another is quickly found, not because of any real qualities possessed by the new object, but rather because the emotion demands some outlet. In Nazi Germany Hitler permitted the displacement of economic and other resentments felt by the Germans after the Treaty of Versailles on to the Jews and Communists, who were thus made scapegoats for the convenience of the Nazi party. It is important to understand that this is one of the commonest types of mental mechanism which is universally, although unconsciously, used by us all.

2. *Projection.*—This is an example of a mechanism which has already been demonstrated. In brief, it means the tendency to project the objectionable qualities we refuse to recognise in ourselves upon others. "It is not I but he who is thinking and doing these wicked things." Thus, as we have seen, people who will not admit to their own impure thoughts accuse others of possessing them; those who are aggressive believe that everybody else but themselves are aggressive; the greedy accuse others of greed, and so on. Carried to an extreme degree, this is the mechanism behind persecution mania or paranoia, as the psychiatrist calls it. Projection is another very important trick of the mind, and its social effects are often all too evident.

3. *Compensation.*—Alfred Adler, one of Freud's pupils who later founded a separate system of psychology, was the first to draw attention to this important mechanism.

Briefly, Adler pointed out that those who suffer from a deep-seated sense of inferiority (whether due to physical or mental defects or to lack of affection in childhood) have a strong tendency to compensate for this either by overcoming the actual defect or by becoming superior in some other field. *See* **Individual Psychology, Section J.**

4. *Rationalisation.*—This, as Bradley said of philosophy, is "the giving of bad reasons for what we do upon impulse." Nowadays, for example, nobody ever goes to war in order to kill a lot of people or take their country from them; they go to war for the other nation's own good—because they want to help them. Rationalisation is too familiar to most of us to need further discussion.

5. *Conversion.*—This is the mechanism which most people find it least easy to understand. Whereas the other mechanisms are, in their milder forms at least, almost normal, conversion is always abnormal, and implies more or less serious disturbance of the mind. There are two types of conversion: hysterical and psychosomatic.

In the first case, a state of mental conflict produces symptoms of physical disorder which, however, are not due to any underlying physical disease. Such cases may show symptoms of blindness, deafness, complete or partial paralysis of the limbs, double personality, or loss of memory, all of which can be shown to be purely psychological in origin, and, in fact, occur because the individual in some sense does not want to be able to walk, see, hear, or remember. In short, the symptom occurs because it gets the individual out of some difficulty which he is facing at that particular period.

People with psychosomatic disorders suffer from actual physical disease as a direct result of mental stress. Within their bodies actual physical damage has resulted from prolonged exposure to emotional tensions. Elsewhere (Section P) something has been said about the autonomic nervous system which prepares the organism for relaxation or emergency. The frustrated worker, hating his job and resenting his boss, has the raised blood-pressure normal to the angry animal; but it continues day in and day out until his arteries become thickened and the pressure can no longer return to normal. The ambitious business-man, mentally on the attack for years at a time perpetuates the associated physical changes normal to an attitude of attack; his stomach-wall is drained of proper blood-supply and the digestive juices, ordinarily neutralised by anti-enzymes in the blood, digest the lining of the stomach itself, causing an ulcer. Of course, what has been said here is inevitably over-simplified; for no disease is due to a single cause, nor is it at all clear why one patient gets one type of psychosomatic disease and a second another.

In summary, this is how views have altered:

(a) To a considerable extent we must discard the old view that sickness is always something that happens to an unsuspecting individual, like being hit on the head by a falling slate. Patients usually go to a doctor in much the same frame of mind as they would go to a watch-maker—"Here, there's something wrong with this watch—what are *you* going to do about it?" But from now on it has to be realised that the patient and the illness are one, that it is because he is the sort of person he is that he has become ill in a particular way.

(b) Fear and hate or anxiety not only cause unhappiness but also sickness and death. Hate and fear can kill.

(c) The psychosomatic diseases and the mental disorders generally are social diseases. They are strongly influenced by the stress of modern life and are on the increase.

(d) Mention must be made of the body-mind problem which these observations bring to the fore. Ultimately, of course, this problem is a philosophical one which cannot be decided by observation or experiment, but today psychologists and doctors are inclined to make use of the working hypothesis that body and mind are one—that "mind" is only a useful word to refer to certain processes occurring in the body. *See also* **Mind and Matter, Section J.**

(e) There are three types of individual who are in rebellion against society: the neurotic, the criminal, and the genius. The differences between the three are that the neurotic rebels in secret or unconsciously, the criminal openly, and the genius by his creative work is able to sublimate his conflicts in art or literature or even to change society nearer to his heart's desire. (It will be understood that this is a very loose formulation of a very complex problem.)

Now it is the modern view that such conflicts are not private and individual as has hitherto been thought (notably by Freud); for it is the conflicts latent in a particular society which are fought out in sensitive minds. Briefly each society is now regarded as a sort of electromagnetic field in which the neurotic, the criminal, and the genius are areas of high tension—in them the conflicts suffered by the society as a whole are magnified to the point of breakdown. Whereas, as was realised long ago, such diseases as cholera, typhoid, or smallpox are due to material defects of society in respect of hygiene and the application of medical knowledge, the behaviour of neurotics, criminals and those with psychosomatic disorders is due to cultural defects of the society in the psychological sphere.

Modern psychology and sociology are showing more clearly than ever before that, in the words of Donne, "no man is an island," and that for the misery or unhappiness or badness of the few we are all responsible. *See also* **Section Q, Part II.**

IV. SPECIAL TOPICS

SONIC BANGS.

1. Historical.

Sonic bangs started as a phenomenon that aroused public curiosity. They are now a feature, of some concern, of the environment of the supersonic age. That people should have been curious when the phenomenon first received publicity in 1952 is not surprising. It is, however, difficult to understand why the origin and nature of sonic bangs should have caused such controversy. No one now disputes that the explanation is the build-up of aerodynamic disturbances into shock waves, as inevitably occurs during flight at supersonic speeds. Many of those who furnished explanations in the early days failed to appreciate that the same phenomenon had been encountered years earlier with artillery shells. Some writers attributed sonic bangs to a build-up of the noise associated with the engine of a high-powered aeroplane: although such a build-up does occur, the intensity from this cause is about one-fiftieth of that associated with the aerodynamic disturbances. Others attributed the characteristic "double bang" to the bow and stern waves that are known to extend from a body travelling at supersonic speeds: although in some respects this explanation is correct, it forms a part only of the general explanation.

The fact that, and the reason why, aircraft would make bangs when flying at supersonic speeds was clearly stated by Sir Graham Sutton in 1949. Earlier L. Prandtl in Germany had discussed the "bang waves" (Knallwellen) that bodies create when travelling at supersonic speeds. Going further back, we find that by the 1920s there existed an elaborate theory, such as that contained in a book by the Frenchman E. Esclangon, of the phenomenon which, in regard to aircraft, we now call the sonic bang. These early theories were, however, concerned mainly with predicting the *occurrence* of bangs. It was not until the 1950s that theoretical methods were developed for predicting the *intensity* of sonic bangs, stemming from the work of G. B. Whitham, C. H. E. Warren, and P. S. Rao.

2. How the Sonic Bang Originates.

Wave Packets.

Nowadays it is fairly widely appreciated that, when a body travels at a speed which is greater

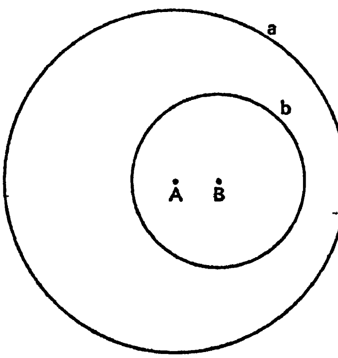

FIG. 1.

than the speed at which disturbances themselves can travel, a mechanism exists for the generation of waves of enhanced intensity. The essentials of this mechanism can be appreciated by comparing Figs. 1 and 2, which show, by the circles *a* and *b*, the locations now reached by disturbances that were generated, at the points *A* and *B* respectively, by an object that has moved from *A* to *B*. In Fig. 1 the object has moved from *A* to *B* at a speed less than the speed at which the disturbances move out from these points, with the result that the circle *b* lies entirely within the circle *a*. In Fig. 2, however, the object has

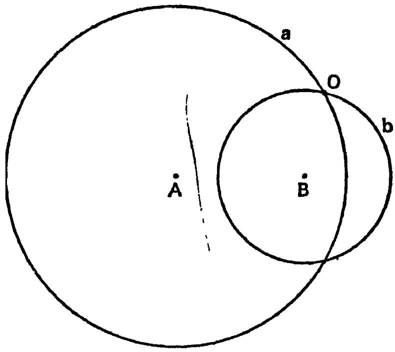

FIG. 2.

moved from *A* to *B* at a speed greater than the speed at which the disturbances themselves move out, with the result that the circles *a* and *b* now intersect. An observer at a point such as *O* therefore receives two disturbances simultaneously. This fact provides the mechanism for the generation of waves of enhanced intensity. In air, disturbances travel at the speed of sound, for sound is the aural manifestation of disturbances in air. A speed greater than the speed of sound is called a *supersonic speed*. The phenomenon is closely analogous to that of a boat on water. At low speeds a boat can move through water creating hardly any waves, but when the speed of the boat increases to a speed greater than the speed at which disturbances themselves can travel—in this case surface waves—the boat will generate waves as we are all aware. The pressure wave-pattern of an aircraft is, of course, more complicated than the surface wave-pattern of a boat in that it involves an extra dimension, and is therefore difficult to visualise.

Sonic bangs have their origin in the pressure wave-pattern generated by an aircraft flying at a supersonic speed. Relatively elementary considerations show that, at any instant, additional contributions to the wave-pattern, called *wave packets*, are generated, which are despatched in those directions about the aircraft which make a certain angle with the direction of motion. For speeds only just greater than that of sound this angle is very small, so that the wave packets are despatched roughly in the direction of motion (Fig. 3), but the angle increases as the speed increases, until, at very high speeds, the wave packets are despatched almost at right angles to the direction of motion (Fig. 4). A line along which a wave packet is despatched is called a *bang ray*. From what has been said there is a cone of bang rays emanating from each point of the flight path, and the totality of wave packets travelling along each bang ray makes up the wave pattern at a given instant.

Let us attempt to describe somewhat more tangibly what is meant by a wave packet. It is the region along a bang ray over which the air pressure is disturbed from its otherwise undisturbed, or "ambient," value. In terms of our

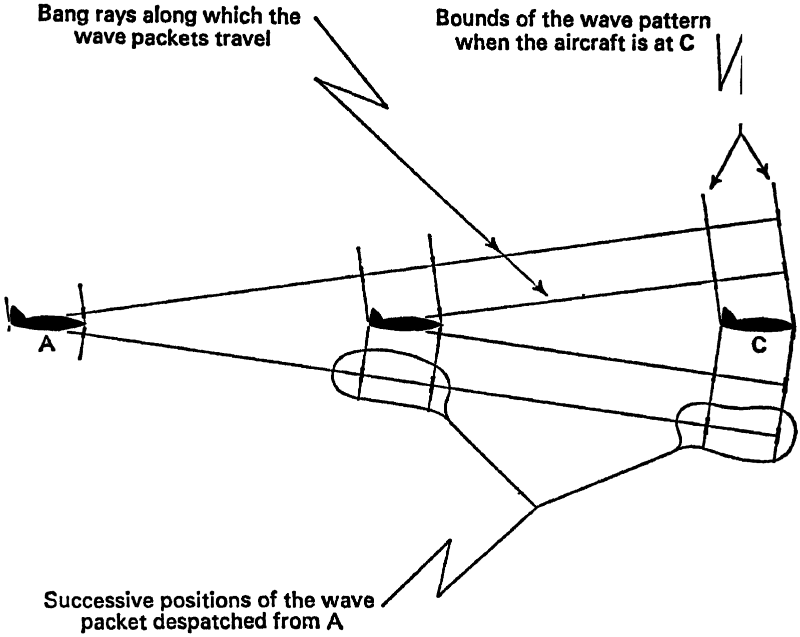

FIG. 3.

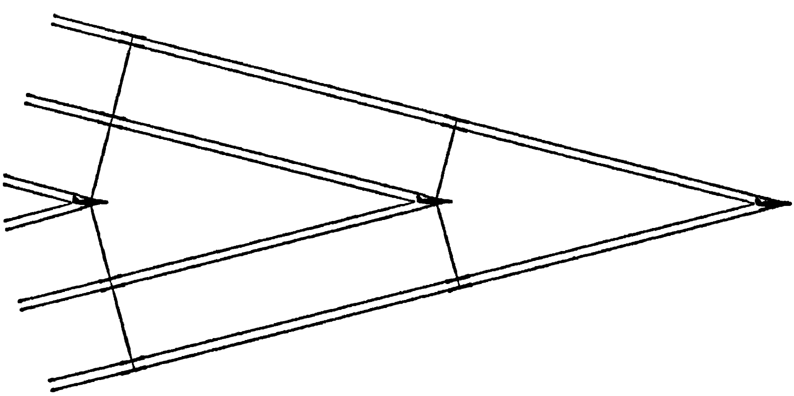

FIG. 4.

boat analogy it would be the region over which the height of the water surface is disturbed from its normal level. We speak of the "shape," or "waveform," of a wave packet, by which we mean how the "overpressure" varies across the region over which the pressure is different from ambient. This waveform is of course intimately related to the shape of the aircraft, and in a most complicated way. It usually consists of a number of intense compressions, or shocks, which are regions where the overpressure increases very rapidly over a short distance, joined by rarefactions which are regions where the overpressure decreases gradually with distance. Broadly, the shocks may be said to arise from the parts of the aircraft which tend to push the air before them, such as the nose, the leading edges of the wing and tail, etc., and the rarefactions are associated with the tendency of the air to flow back into the spaces that would otherwise be left as each part of the aircraft moves on.

3. How the Sonic Bang is Propagated.

We have said that the wave packets generated by an aircraft flying at a supersonic speed are despatched along bang rays, along which they move at the speed of sound. However, in the course of propagation the waveform tends to change in three main ways. First, the general level of overpressure tends to fall as the rays spread out and diverge, the common attenuation of intensity with distance. Second, as it propa-

gates, the waveform tends to lengthen and to take up more and more a characteristic " N-wave " shape, consisting of an initial sharp rise in pressure, then a gradual fall, and then a final sharp rise again back to the ambient value (Fig. 5). Near

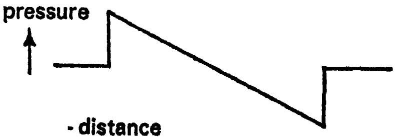

FIG. 5.

the aircraft, as we have said, the waveform is quite complicated, and the reason that it tends, as it propagates, to lengthen and to take up the relatively simple form just described is associated with the tendency for the rarefactive parts of the waveforms to become less steep and for the compressive parts to steepen and to travel slightly faster, relatively, than the mean speed of the wave packet. This tendency is a fundamental feature of wave motion in general. It explains also why the complicated state of the sea in a storm area devolves into a smoother swell at large distances from the storm, and why the fronts of the waves often " break."

Finally, the waveform can be affected by the properties of the atmosphere through which it travels, the most important features of the atmosphere being its thermal motion and turbulence, and the properties of air itself, such as its viscosity, thermal conductivity and humidity, which can lead to the dissipation of the energy of waves propagated through it. The effects of these " imperfections " compared with ideal conditions is as yet only partly understood. It is known, however, that they can lead to distortions of the waveform from its classical N-wave shape (Fig. 5), the most common variations being what are called " spiky " N-waves (Fig. 6), in which

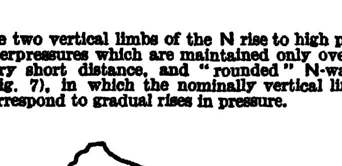

FIG. 6.

the two vertical limbs of the N rise to high peak overpressures which are maintained only over a very short distance, and " rounded " N-waves (Fig. 7), in which the nominally vertical limbs correspond to gradual rises in pressure.

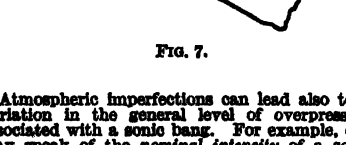

FIG. 7.

Atmospheric imperfections can lead also to a variation in the general level of overpressure associated with a sonic bang. For example, one may speak of the *nominal intensity* of a sonic bang, by which is meant the intensity that a given aircraft, flying at a given speed and altitude, would make if the atmosphere were an ideal medium, having no viscosity, humidity, etc., and had the standard variation of temperature with altitude, and if there were no air turbulence or winds, etc. However, because in the real atmosphere there are turbulence, winds, etc., the bang rays do not spread out in a uniform way with the result that the law of attenuation of intensity with distance tends to vary from ray to ray. The effect of this is that, instead of the intensity of sonic bang received over a given area being fairly uniform, it tends to vary from point to point. Although the average intensity over an area is closely equal to the nominal value, the variation is such that about one sonic bang experience in ten thousand will be about double, or half, the nominal intensity.

The course of propagation of a wave packet is along its respective bang ray, but this is by no means a simple phenomenon. If the atmosphere were a still, uniform medium the bang rays would all be straight lines, but because of the temperature variations in the atmosphere, which imply variations in the speed of sound from point to point, and because [illegible] the wind shears which are a common feature, t[illegible] bang rays are refracted, and become curved lin[illegible] From a knowledge of the temperature and [illegible] gradients the refracted path of the bang rays [illegible] be worked out. Under typical atmospheric [illegible]ditions the effect is usually that of causing [illegible] bang rays to curve away from the ground. We can appreciate, therefore, that if a bang ray is approaching the ground at a small angle it may be bent away to such an extent that it does not in fact reach the ground. This is a common acoustic phenomenon in regard to the propagation of sound at small angles in the presence of temperature and wind gradients. In regard to the sonic bang phenomenon it leads to the so-called " cut-off " phenomenon. If the atmosphere were uniform there would be no limit to the lateral distance at which one would experience the overflights of a supersonic aircraft, but because of the cut-off phenomenon sonic bangs are not heard beyond a certain lateral distance. On the boundary, beyond which the bang rays do not reach the ground, the bang rays just " graze " the ground.

4. How the Sonic Bang is Observed.

Effect of Buildings.

We have discussed how a sonic bang originates, and how it is propagated. Were the problem of how it is observed, or received, merely that of following a particular wave packet along its bang ray, we should merely have to consider the effect of any local environment at the point of reception, such as whether any transmission into a building was involved. However, there is more to it than this, because we must also consider whether more than one wave packet, each having travelled along its own bang ray, can arrive at the same point at about the same time. Let us consider this last point first.

Let us consider first the case of reception outdoors in the open. In general two wave packets will reach an observer, one having come along a bang ray direct from the aircraft, and one along a bang ray that has been reflected from the ground (Fig. 8). The second will be delayed relative to the first by an amount depending on the height of the point of observation above the ground. For points well above the ground (Point *A* in Fig. 8) the two wave packets might arrive sufficiently spaced in time that an observer would record them as two sonic bangs. However, for points nearer the ground the two wave packets will tend to merge, and one would probably record them as a single sonic bang event of somewhat complex waveform, although in fact the combined waveform is closely that given by " linear superposition." For points very near the ground (Point *D* in Fig. 8) the incident and reflected wave packet will arrive almost simultaneously, thereby giving the impression that a single wave packet is experienced, but of double the so-called " free-air " overpressures.

One can now readily proceed to more complex environments. For an environment outdoors near a big building or wall (Fig. 9) it is possible for

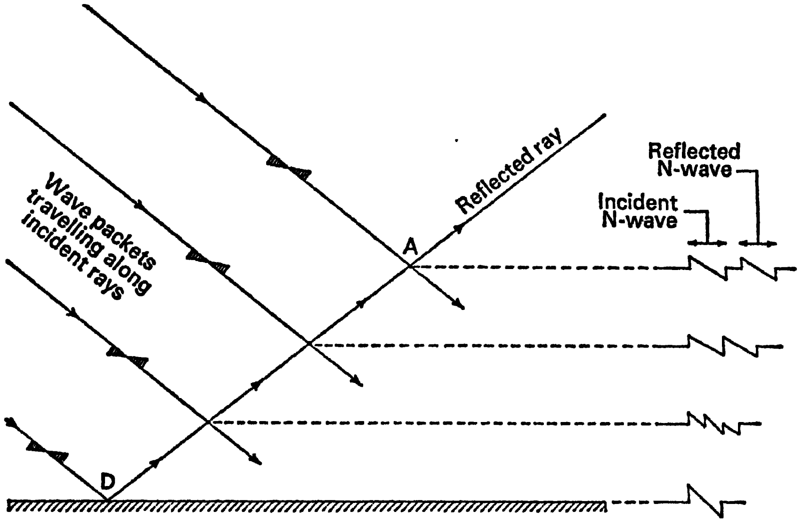

FIG. 8.

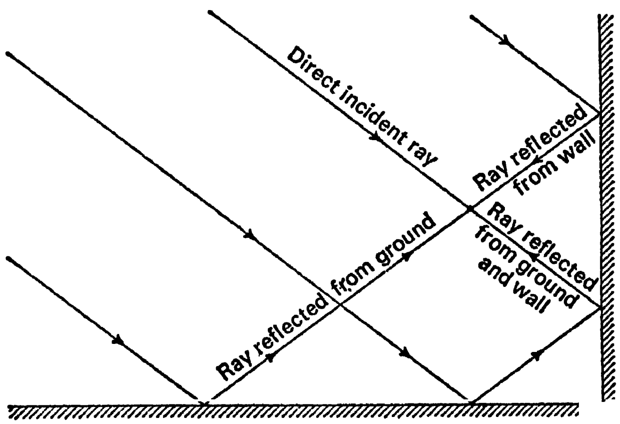

FIG. 9.

four wave packets to reach an observer, one having come along a direct bang ray, one along a ray reflected from the ground, one along a ray reflected from the wall, and one along a ray reflected from both the ground and the wall. With more complicated building complexes the

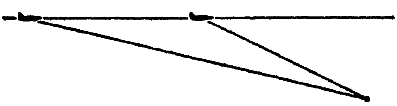

FIG. 10.

situation could be correspondingly more involved. In such situations the sonic bang is heard as a very reverberant event whose waveform depends intimately upon the geometry of the building complex and upon the observer's position relative to it.

We see that conditions at a point of reception can be complicated by the contemporaneous arrival of more than one wave packet owing to reflection from various obstacles. However, it is possible for more than one wave packet to arrive contemporaneously owing to conditions at the points of origin. Although for steady straight

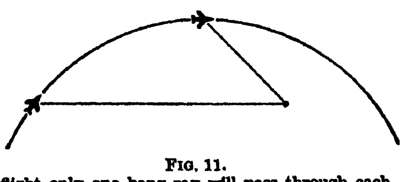

FIG. 11.

flight only one bang ray will pass through each point of observation, if the aircraft accelerates (Fig. 10) the angle of the bang ray to the direction of motion will increase, and it is possible for more than one bang ray to pass through a given point, and therefore for more than one wave packet to arrive there. Likewise if the aircraft flies in a curved path (Fig. 11), even at steady speed, it is

possible for more than one bang ray to pass through a given point. From vagaries in the flight path, therefore, complicated sonic bang events can result. An observer may be puzzled by the fact that, whereas the sonic bang event from a given aircraft is usually a characteristic double bang, on occasions he may hear three or four bangs, or even only one bang. The explanation may stem from any one of the causes that have been discussed, and a definite answer in a specific instance would demand knowledge of the precise flight path of the aircraft, of the observer's position relative to it, and of his environment.

Finally, we must consider an observer in an indoor environment. Although sonic bangs are readily heard indoors, experiments have shown that they cannot be so positively identified as such compared with experiences outdoors. This is because the event is greatly modified by the manner in which it is transmitted indoors—by whether windows are open or closed for example—and by the reverberation characteristics of the room in which it is heard.

5. Focusing.

We have seen that quite complicated sonic bang events can result when more than one bang ray passes through a given point. However, the pattern of bang rays generated by an aircraft in supersonic flight may be such that they are focused, or, in mathematical terms, that they have an envelope, in just the same way that light rays are focused by a lens, for example. When this occurs the theory of separate wave packets each travelling independently along its own bang ray ceases to be valid, and it becomes more difficult to formulate a theoretical description of the phenomenon. It suffices to say that at and near a point of focus the waveform is usually complex and the overpressures high.

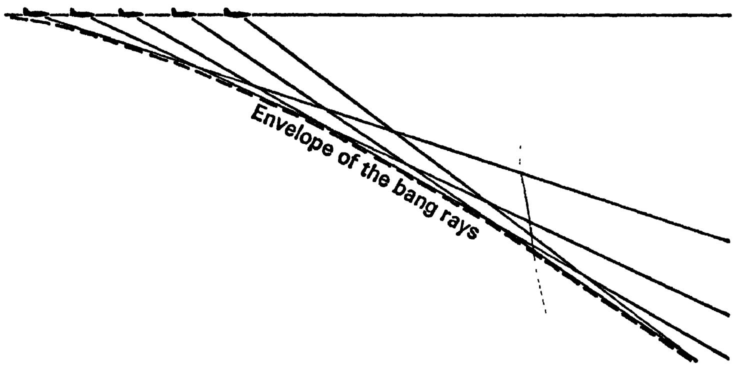

FIG. 12.

What is relatively simple, and important, to predict is when focusing will occur. The simplest case to consider is that of an aircraft accelerating to supersonic speeds along a straight path. As the aircraft accelerates the bang rays emanating from successive points of the flight path make progressively larger and larger angles with it, and, as they have their origins at points further and further along the flight path, it is fairly easy to see that each bang ray will, in time, intersect all the bang rays emanating from earlier points along the flight path (Fig. 12). We have here, therefore, the basic mechanism for the formation of an envelope of bang rays, or, in more popular terms, for focusing. Because of the essential three-dimensional nature of the phenomenon it is very difficult to visualise or describe, but it suffices to say that when an aircraft accelerates to supersonic speeds focusing always occurs, and the region on the ground where this focusing is experienced is crescent-shaped (Fig. 13), the overall dimensions of the crescent being some two to three times the altitude of the aircraft, the crescent itself lying a distance roughly four to five times the altitude of the aircraft ahead of the point at which the aircraft attains the speed of sound. Consideration will show that the deceleration

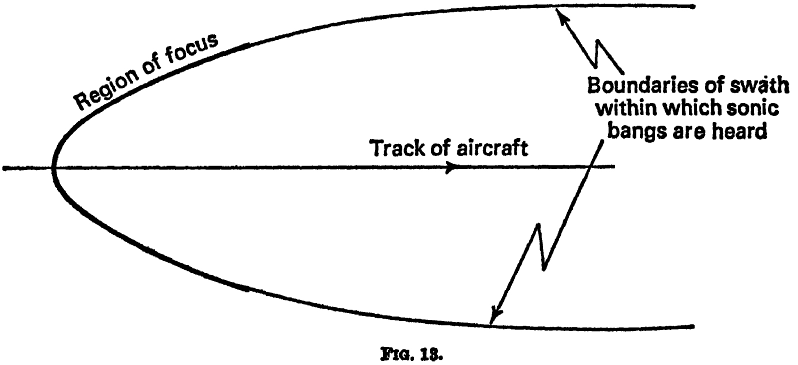

FIG. 13.

process at the end of a spell of supersonic flight is defocusing.

Focusing can also occur when an aircraft manoeuvres or turns. Again it is a case of considering whether the manoeuvre makes it possible for a bang ray to intersect another bang ray emanating from an earlier point. Although such consideration will show that manoeuvring always leads to focusing somewhere, what matters in practice is whether such focusing occurs on the ground. For the tight manoeuvres that fighter-type aircraft can perform at low supersonic speeds focused bangs will usually be generated somewhere on the ground, but, for the more gradual turns that civil supersonic aircraft, flying at a Mach number of 2 or higher, are likely to perform, the bang rays will usually reach the ground before being brought to a focus, the focus itself occurring subsequently above ground level after reflection.

6. Effects on People, Animals, and Buildings.

Sonic bangs are, to people, a startling phenomenon, for from their very nature, they occur without warning, there being no gradual build-up in noise level as occurs with the noise of aircraft near airports for example. Being startling, they tend to make people jump if they are awake, or to awaken them if they are asleep. The degree to which these effects occur depends upon the individual, and upon the intensity of the bang. It is naturally a nuisance, for example, to be continually awoken by sonic bangs, although not perhaps so if the disturbance were occasional. At the present time much research is being conducted into the magnitude of this problem.

Much of what has been said about the effect of sonic bangs on people applies equally well to animals, for some animals react very markedly to a sudden bang. Sudden bangs are, after all, one of the forms of bird-scarer, and indeed it has been claimed that sonic bangs have frightened and caused panic among chickens. There are reported cases of abortion in livestock attributed to sonic bangs, and furry animals like mink are reported to have killed their young.

The effect of sonic bangs on buildings has been the subject of much research. The parts of a building which are most sensitive to sonic bangs are windows and plasterwork. The real problem here is not the general level of bang that an aircraft makes, but the bang of enhanced intensity that we have shown will occasionally occur due to either atmospheric effects or focusing manoeuvres. In the United States, Britain, and France many claims of damage to buildings by sonic bangs from military aircraft have been made in recent years, and although in few cases have the authorities admitted liability nevertheless *ex gratia* payments of compensation have been made.

7. Problems of Civil Supersonic Aircraft.

Sonic bangs are moving on from being an incident at an air show, whereby a pilot could demonstrate audibly that he had broken the sound barrier, to being a feature of the environment along the airways of civil supersonic aircraft. Associated with this change they have moved on from being something which the public had gone to hear to being a possible nuisance which is causing concern.

A civil supersonic aircraft will cause sonic bangs on the ground all the way along its route while it is flying at supersonic speeds. For an aircraft flying at twice the speed of sound at an altitude of nearly 60,000 ft. the width of the "carpet" (Fig. 13) on the ground where bangs will be heard will be some 60 miles. The carpet will start some 25 miles beyond the point at which the aircraft accelerates through the speed of sound, because the wave packets, which are eventually heard as sonic bangs, travel in a forward, and downward, direction. Similarly the carpet will end just beyond the point at which the aircraft decelerates back through the speed of sound. The intensity of the sonic bangs is greatest along the actual track of the aircraft, the intensity falling off slightly to the edges of the carpet. However, as already mentioned, it is a feature of the acceleration process that, at the crescent-shape start of the carpet (Fig. 11), slightly more intense bangs occur due to focusing.

Because of the relatively great width of the sonic-bang carpet, a large number of people will be made aware of the passing of a civil supersonic aircraft, many more than are aware of the passing of a train on a railway or a coach on a motorway. Indeed the sonic bangs will be a frequent audible evidence of the supersonic age, just as at present television aerials are a ubiquitous visible evidence of the television age.

As with the exploitation of many scientific discoveries, the making of sonic bangs will have to be controlled if they are not to lead to a lowering of living standards. Just what form this control should take is one of the problems being debated at the present time. It is envisaged that civil supersonic aircraft will not be permitted to fly at supersonic speeds except along certain agreed airways, and above a certain altitude. Moreover, because during the acceleration to supersonic speeds they will make bangs of enhanced intensity in a crescent-shape area at the start of the sonic-bang carpet, it is envisaged that they will have to arrange to be flying over an unpopulated region, such as the sea or the desert, at this time.

DETERGENCY.

The Physics and Chemistry of Washing and Washing-up.

Detergency can be defined as a process in which dirt is removed from a solid surface by means of a liquid, and in all but a few specialised cases the major constituent of the liquid is water. The nature of the solid substrate may vary from metals, glass, or china to fabrics such as cotton, wool, and an ever increasing variety of man-made fibres, and the soiling matter may generally be either solid (*e.g.*, dust, soot, and grit particles) or fatty. In most practical cases the soil is composed of complex mixtures containing large numbers of different chemical species.

The importance of the detergent industry is reflected in the production figures shown in Table I. In the United Kingdom alone, retail

TABLE I.

PRODUCTION (1,000 TONS) OF SOAP AND SYNTHETIC DETERGENTS IN 1961.

	United Kingdom	U.S.A.	Germany	France
Soap	439	457	103	190
Synthetic detergents	322	1,585	378	330

sales of household detergents in 1964 reached the figure of £70 million and in 1966 became the subject of a report by the Monopolies Commission.

Whereas the actual detergent and any additives used will depend on the nature of the substrate, the general principles underlying the detergency process are common to all substrates.

1. Properties of Surfaces.

Since the interaction between the detergent solution and the soiling matter takes place on the surface of the solid substrate, the detergent process depends to a large extent on the characteristic physical properties of solid/liquid interfaces. Fig. 1 shows how in a solid the molecules exert forces on their neighbours. For any molecule in the bulk, for instance that marked *A*, the net force is zero, since it is surrounded symmetrically by a number of identical molecules. However any molecule *B*, in the surface layer, is subject to a net inward pull. The result of this

force, known as *surface tension*, is for the substance to attempt to reduce the number of molecules in the surface. This it can sometimes

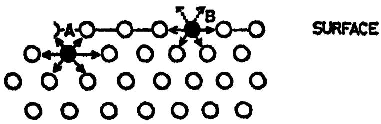

FIG. 1—Surface Forces: molecules within the solid (or liquid) are subject to balanced forces, but for molecules in the surface there is a resultant downward force.

achieve by changing its shape, so that liquids will spontaneously take up the shape of smallest surface area, *i.e.*, a spherical drop. Where a change of shape is ruled out for reasons of rigidity, a substance can nevertheless reduce its free surface, and hence its surface tension, by covering itself with a layer of liquid. This process of

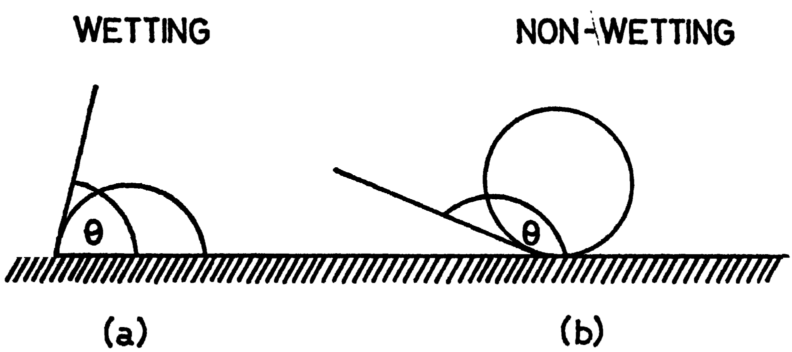

FIG. 2—Wetting Behaviour of Liquids on Solid Surfaces:

(*a*) wetting of the solid occurs when θ is less than 90°,
(*b*) for contact angles above 90°, the liquid will not wet the solid and can be made to roll off the surface.

reducing the surface tension is known as *adsorption* and plays an important part in detergency.

When a drop of liquid is placed on to a solid, it will spread along the surface only if the attractive forces between the molecules of the liquid and those of the solid are stronger than the forces between the molecules in the liquid.

Let us assume that the drop resting on the solid, shown in Fig. 2(*a*), constitutes the soiling matter. The angle θ between the solid surface and the tangent at the point of contact with the drop is known as the *contact angle*, and as this angle approaches zero, so the soil will spread along the substrate. On the other hand, if θ approaches a value of 180°, as in Fig. 2(*b*), then the soil will reduce to a minimum its contact with the substrate; this situation also arises when drops of water are placed on a greasy or water-repellent surface. It is therefore one of the functions of the detergent solution to "roll up" the oily soiling matter, until it can be lifted off the surface of the substrate by simple agitation. Thus for a particular detergent to be effective in removing a given type of soil, it must be able to spread along the substrate, thereby gradually increasing the contact angle between solid and soil to 180°.

The position is slightly different where solid dirt particles adhere to the substrate to be cleaned, but here again the detergent will penetrate between the solid and the particles by overcoming the forces which hold the particles on the substrate.

2. The Chemical Nature of Detergents.

The above discussion shows that for a detergent solution to perform its task, it must come into intimate contact with the surface to be cleaned, thereby displacing the soil.

In order to perform this function, the detergent molecule must possess certain features:

(*a*) it must be soluble in water, at least in those cases where the detergent process takes place in an aqueous medium, and
(*b*) it must be strongly adsorbed at the solid surface.

In fact it must be adsorbed preferentially to the soiling matter, so that it can displace the latter from the substrate.

Fig. 3 shows the chemical structure of a typical detergent molecule which forms the basis of many commercial detergent compositions. Essentially it consists of a branched chain of carbon atoms (usually between 12 and 18) which confer water insolubility and oil solubility on the molecule. At one end of the chain is a bulky group (in this case a sulphonate, or SO_3) which carries a negative electrostatic (ionic) charge and provides the water solubility. Since the molecule as a whole must be electrically neutral, the large negative ion is associated with a small positive ion, in this case sodium (Na) which does not, however, contribute to the detergent properties. Although the detailed molecular structure does vary from one type of detergent to another, the common features include a water-insoluble (hydrophobic) flexible chain of carbon atoms and a group which may or may not carry an electrostatic charge but which confers water solubility to the molecule as a whole. This duality of properties is generally referred to as *amphipathy*. Where the water-soluble (hydrophilic) group carries a positive charge, the detergent is called *cationic*, and where the charge is negative, the detergent is *anionic*. When the molecule is uncharged, the detergent is said to be *non-ionic*. The particular nature of the solid substrate will frequently determine the type of detergent to be used.

The oldest known detergents comprise the fatty acid soaps which are obtained from the chemical splitting (saponification) of fats and still provide a substantial proportion of all the detergents used. The synthetic detergents, derived mainly from by-products of oil refining processes, became of importance during the Second

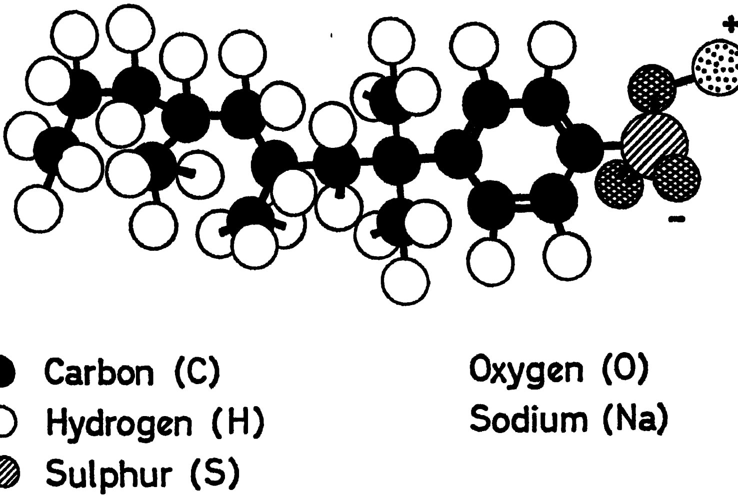

FIG. 3—Detergent Molecule: sodium tetrapropylene benzene sulphonate is one of the most widely used household detergents; its chemical formula is $C_{18}H_{29}SO_3Na$.

World War, as a result of a general shortage of natural fats. Since then their production has increased rapidly, and new specialised products are constantly being developed.

The importance of tailor-made detergents was demonstrated during the *Torrey Canyon* disaster of 1967, when large quantities of crude oil polluted the beaches of Cornwall. The product used had to disperse a highly viscous petroleum product in cold sea water. At the same time, in view of the large amounts used, it was desirable that the detergent should not affect marine life in the area. The technical performance of the detergent was very satisfactory, but the inter-tidal and shallow water creatures of the Cornish coast suffered heavily, *e.g.*, sea anenomes, limpets, starfish and plankton.

3. Physical Properties of Detergents in Solution.

The amphipathic nature of the detergent molecules (and ions) gives rise to two properties which form the basis of the detergent process.

(1) Surface Activity.—Because of their peculiar structure these molecules readily aggregate at the surface, as shown in Fig. 4, since in this position the water-soluble head group is in the water, whereas the water-insoluble tail is expelled from the aqueous phase. As a result the concentration of detergent is higher at the surface than in the bulk solution, *i.e.*, the detergent is strongly adsorbed at the surface, and it thus lowers the surface tension of the water. This phenomenon is referred to as *surface activity* and finds application in many industrial processes other than detergency, *e.g.*, dyeing, water-proofing, metal-refining, textile-finishing, and paint technology.

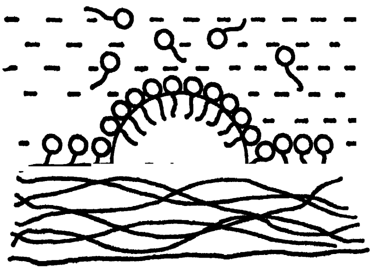

FIG. 4—Adsorption of Detergent: the detergent is adsorbed at the interfaces between solid and wash liquor and between soil and wash liquor. Eventually the soil is displaced from the substrate.

The adsorption of detergent is not limited to the air/water surface but will occur wherever an interface is formed between the solution and another solid or liquid. Reference to Fig. 2 shows that for the soiling matter to be removed from the substrate, the detergent must be preferentially adsorbed on the solid. When this is the case, rolling up occurs and both the solid and the soiling substance will be covered by an adsorbed layer of detergent, as shown in Fig. 5. It is thus seen that surface activity is closely related to dirt removal.

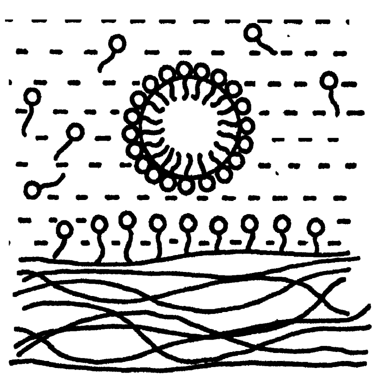

FIG. 5—Prevention of Redeposition: the soil has been removed from the substrate and is prevented from redepositing by an adsorbed layer of detergent.

(2) Micelle Formation.—The other property which distinguishes detergents from most other

molecules concerns the state in which they exits in solution. It was recognised in 1894 that above very low concentrations soaps in solution form aggregates. An intensive study of the properties of soap solutions during the past forty years has established that these aggregates, which have been termed *micelles*, are made up of about fifty single soap ions, as shown schematically in Fig. 6.

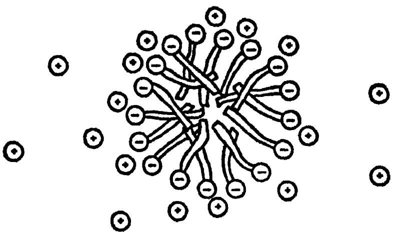

FIG. 6—Micelle Formation: an aggregate of detergent ions with the hydrophilic head groups facing outwards. To reduce electric repulsion between the negative charges, some positively charged counter ions are adsorbed on to the surface of the micelle.

The concentration at which the micelles form is a characteristic property of a given detergent, and it depends mainly on the size and shape of the hydrophobic tail and the nature of the hydrophilic head group. In the case of ionic detergents the micelle can, to a first approximation, be regarded as a large, charged sphere, and since like charges repel each other, the stability of the micelle is enhanced by the adsorption to the micelle surface of a number of oppositely charged ions (counter ions), as shown in Fig. 6.

The driving force towards micelle formation deserves some mention: originally it was believed that this was provided by the inherent incompatibility of water and the oil-like hydrophobic tails of the detergent molecules or ions, *i.e.*, the idea that like attracts like. Thus, micelle formation was regarded as a process by means of which the water would eject the oil-like parts of the detergent, in order to reduce the total contact area between water and "oil." However, recent studies of the behaviour of hydrocarbons in aqueous solution and of the spreading of oils on water surfaces have shown that, contrary to the older belief, water and oil have a considerable affinity for each other. In addition, however, the oil molecules exert an influence on the water molecules surrounding them, forcing them to take up a configuration which may bear some resemblance to the structure of water molecules in ice; hence, this effect is frequently referred to as the "iceberg" effect. It is now widely believed that this peculiar property of water is responsible for micelle formation, and indeed for many biological processes involving molecules, such as proteins, lipids, and nucleic acids which possess oil-like groups and show some of the properties of the detergents. Thus, micelle formation may be regarded as being intimately related to unfavourable structural changes brought about in liquid water by the presence of oil-like molecules or portions of molecules.

4. Detergent Action.

For a commercial detergent composition to be effective it must be able to remove the soiling matter from the solid substrate within a reasonable period, and subsequently it must prevent the re-deposition of the soil. Although the properties of surface activity and micellar aggregation are essential attributes of detergents, several other effects must be considered, which are specific for each soil/substrate/detergent system, and there is as yet no comprehensive theory of detergency. Some of these effects result from chemical reactions of metal ions (mainly calcium and/or magnesium) in the water used, with the detergent and the particles of soiling matter, or complex reactions between detergent and fatty soiling matter. Furthermore soaps are hydrolysed in aqueous solution, *i.e.*, they react with water to form "acid soaps" which can be regarded as soiling matter, because of their limited solubility in water.

In order to prevent these undesirable reactions which reduce the efficiency of detergents, compounds known as "builders" are usually added to commercial detergent compositions. Builders have no surface active properties of their own, but they improve the performance of synthetic detergents to a level where they are equal to one another and to soap. The most commonly used builders are polymeric sodium silicates and phosphates. In solution these salts combine with calcium ions which would otherwise react with soap to form insoluble calcium soap (scum). Builders also render the solution alkaline and thus inhibit the hydrolysis of soap.

There is another [illegible]t to the removal of calcium salts from [illegible] water: although the detergent may remove [illegible] solid soil particles from the substrate, the [illegible]lcium ions can combine with the suspended [illegible], causing them to agglomerate by a process referred to as flocculation. In this way the particles gradually increase in size and weight and eventually they are precipitated. Thus the mopping up of calcium ions by the builder prevents the flocculation of particulate soiling matter.

Other chemical reactions which probably contribute to the detergency process are those between the soiling matter and the detergent molecules. Thus, compounds, such as glycerides and steroids, which occur in natural soiling matter, react with detergents to form viscous substances. In dishwashing technology the problem is even more complex, since food remnants contain many species, *e.g.*, proteins and carbohydrates, which are known to interact strongly with detergents.

Other factors which clearly influence the removal of soil from solids are temperature and agitation. The effect of temperature is particularly important in the case of greasy soiling matter, the viscosity of which may drop quite sharply with rising temperature, thus making it easier for the detergent to roll up the soil. Suitable agitation of the wash liquor will help to break up drops of liquid soil into smaller droplets, and as additional soil/water interface is created, so detergent will be adsorbed and stabilise the droplets against coalescence; this process is known as emulsification. On the other hand the repeated application of excessively high temperatures will cause damage to fabrics and also reduce the ability of the detergent to prevent the soil from being redeposited on the substrate. The same can be said for excessively violent mechanical agitation during the detergent process. These considerations, as well as others (*e.g.*, possible corrosion of metal parts by detergents), must be taken into account in the design of washing machines.

Whereas the property of surface activity is largely responsible for the effectiveness of detergents in removing oily and particulate dirt from solid surfaces, the phenomenon of micelle formation contributes to the prevention of redeposition in the soil. Figure 6 shows that the interior of the micelle resembles an oil. It thus has a high affinity for the oily soiling matter and can accommodate considerable amounts of organic substances which are otherwise almost insoluble in water; this process is called *solubilisation*.

Another, possibly more important, factor influencing redeposition behaviour is the nature of the forces between suspended soil particles and between the particles and the substrate. Once removed from the substrate, these particles will undergo frequent collision with the substrate and with each other. Thus, if there is a net attraction between the surface and the colliding particle, then the latter will adhere. Presumably adsorbed detergent and the presence of builder ions modify

the surface in such a way it repels the oncoming soil particle, thus preventing redeposition. However, the exact mechanism of the prevention of redeposition is not yet understood.

Very effective in the prevention of redeposition of soil on to cotton is a cellulosic polymer (sodium carboxymethyl cellulose), small amounts of which are normally added to commercial detergents. Because of the similarity of its molecular structure to that of cotton, this substance appears to be strongly adsorbed on cotton, but how this is related to its remarkable power as a redeposition preventative is one of the outstanding problems.

5. Ancillary Effects.

Detergent action can now be seen to consist of a complex balance of individual physical and chemical processes, many of them imperfectly understood. There are a number of phenomena which are normally included in the term detergency, although they do not contribute to the primary mechanism of dirt removal by detergents.

The role of foam in the detergent process has been studied in some detail, and the popular belief that a good lather is synonymous with efficient cleaning action has not been confirmed. The surface activity of detergents tends to confer on them the ability to stabilise foams, but on the other hand, many compounds which produce very stable foams have no detergent properties at all. Since a stable head of lather will form only above the critical micelle concentration, it provides a visible guide that sufficient detergent is present in the wash liquor.

Additives which have found almost universal use in detergents over recent years are the optical bleaches. These compounds, although contributing nothing to the dirt removal properties, are able to absorb radiation from the ultraviolet part of the spectrum, to alter its wavelength, and to re-emit the radiation as visible light. They can thus increase the apparent "whiteness" of the substrate, but it must be borne in mind that in this context there is no connection between the terms "clean" and "white." Ever since the optical bleaches were first used in commercial detergents, our eyes have gradually become adjusted to a new standard of whiteness so that a clean cotton fabric looks distinctly grey by comparison with a fabric treated with an optical bleach.

Finally mention must be made of some of the water-pollution problems which can be directly ascribed to the increasing use of synthetic detergents. The formation of stable masses of foam near weirs and locks on rivers in densely populated areas has become a familiar sight. Even more serious is the resistance of some detergents towards biochemical degradation by microbial organisms, resulting in a gradual build-up of detergent concentrations in natural waters and sewage treatment plants. Because of their surface-active properties they affect the sedimentation of suspended solids and the clarification of turbid waters. Other detrimental effects currently receiving much attention include their toxic behaviour towards bacterial and algal flora and their possible contamination of wells and underground water supplies, resulting from an alteration of the permeability of soils. All these far-reaching effects have led to the passing of new legislation by many countries, as a result of which the only detergents which may be marketed are those which are readily attacked and degraded by micro-organisms.

THE ELECTRON MICROSCOPE.

1. Background.

A microscope is a device that, with the aid of lenses, produces a magnified image of details too small to be discerned with the naked eye. In an optical microscope, light is shone through a specimen, and the eye observes the final image directly. But the light itself has a structure, the characteristic dimension of which is its *wavelength* and when the latter is as big as, or bigger than, the detailed structure of the object, the microscope will no longer be able to form an image of it, however high the magnification may be. A microscope thus has a *limit of resolution*, typically of about 10,000 Å (1 Å = 10^{-8} cm.).

If we are to exceed this limit, radiation of shorter wavelength must be employed, and in the 1920s de Broglie showed that a wavelength may be associated with moving particles [*see* F13]: for electrons this wavelength (λ) is given approximately by $\lambda(\text{Å}) = 12/\sqrt{V}$, where V (volts) denotes the accelerating voltage of the electrons. This is a convenient measure of the electron velocity, for in electron microscopes, a beam of fast-moving electrons is produced by passing the electrons through a potential difference, V volts. For 100 kV. electrons, therefore, $\lambda \simeq 0{\cdot}04$ Å.

Still during the 1920s, Busch showed that certain types of electric and magnetic fields behave as electron lenses, in the sense that they focus a fine pencil of electrons to a point, so that if a beam of electrons is fired through a specimen, a sharp magnified image will be formed.

During the early 1930s progress was rapid, particularly in Germany, and by 1933, Ruska of Berlin had built the first electron microscope to exceed the limit of resolution of the light microscope; in 1934, Marton, in Brussels, obtained the first electron micrograph of a biological specimen and in 1939 the Berlin firm of Siemens delivered their first commercial instrument.

The principal users of electron microscopes are biologists, crystallographers, and metallurgists. Until the end of the 1950s, specimen preparation techniques were not good enough for use of electron microscopes to be widespread. Nowadays, however, they have reached so high a degree of refinement that no laboratory in which microstructures of any kind are to be studied is complete without its electron microscopes. We might add that a high resolution instrument costs about £15,000 and a medium resolution microscope, about £9,000. Such instruments consist of a desk at which the operator sits with control panels on either side of him; the microscope column is a metal cylinder standing vertically on the desk in front of him about a foot in diameter and four feet tall.

2. The Elements of an Electron Microscope.

Electron Lenses.

In essence, an electron microscope differs little from a light microscope: a specimen is illuminated with a beam of electrons that subsequently passes through an objective and a projector lens, and finally falls on a fluorescent screen upon which the image is formed. There are many important practical differences, however.

The electrons are supplied by an *electron gun*, which consists of a heated V-shaped or "hairpin" filament, a control electrode and an anode. The anode voltage can normally be set at various values between 40 and 100 kV., so that a fine beam of fast-moving electrons emerges into the evacuated column of the microscope. Although the exact value of the accelerating voltage is of no great interest, it is imperative that it be very highly stabilised, for the electron wavelength is determined by it. The electron beam must be highly *monochromatic* (that is, have a very narrow wavelength spread) for electron lenses have immense *chromatic aberration*, which is one of the factors limiting the resolution of the instrument. If electrons of various energies, and hence of various wavelengths, are present, a number of images will be formed at slightly different places, each corresponding to a different energy, and the observer will see a blurred image in which all the individual images are superimposed. This is known as chromatic aberration, for its origin is similar to that of the coloured effects to be seen through poor quality magnifying glasses or opera-glasses.

A good vacuum must be maintained within the entire microscope, for the electrons are so light that they would rapidly be diverted from their straight ray-paths by any gas molecules in their way.

The electron beam passes through the first lens of the microscope, the *condenser*, which directs the electrons towards the specimen. In most microscopes, all the lenses are magnetic, as magnetic lenses are in general of higher optical quality than electrostatic ones. The lens is essentially an electromagnet, and consists of an iron yoke enclosing a current-carrying coil. The electrons pass through the centre of the lens, in which a hole is drilled, and the yoke is designed so that a strong magnetic field is concentrated within a small volume.

The electrons next encounter the *specimen*. The latter must be extremely thin, for otherwise all the electrons would be halted within it, and the techniques of specimen preparation have become extremely complex. Biological specimens, for example, are first fixed and embedded in a plastic medium, such as araldite or epon. When they are ready to be examined, they must be stained and cut into very thin sections with a *microtome*, which is nowadays commonly fitted with a diamond knife. A vast amount of research has gone into finding methods of doing all this without damaging the minute structures that the biologist wishes to observe.

In a light microscope the specimen affects the amplitude of the light shone upon it; in an electron microscope, however, all the electrons that fall on the specimen normally emerge from the other side, so that the relative opacity of the object does not seem to have affected the beam. The directions in which the electrons are travelling will have been altered, however, for different substances in the object will refract or *scatter* the electrons by different amounts. The next lens, the objective, is therefore equipped with a small aperture stop, which halts electrons that have been scattered through larger angles, and creates *contrast* at the final image.

The *objective* is perhaps the most critical element of an instrument that contains many very delicate components. The specimen lies close to its *focal plane* so that it produces a highly magnified image, but the resolution of this image will be acutely dependent on the quality of the objective. Electron lenses suffer from extremely high *spherical* and *chromatic aberration*, and considerable attention is given to designing the objective lens to keep these defects as small as possible, *e.g.*, the electric currents that produce the focusing field are highly stabilised and the shapes of the pole-pieces are selected with the utmost care. However carefully the latter are constructed, the lens is always slightly *astigmatic*, so that the image is never quite sharp, but this is remedied by means of a *stigmator*, a device that cancels the effect of the offending component of the magnetic field of the lens.

An intermediate image of the specimen is formed far beyond the objective; the beam is now travelling nearly parallel to the axis of the microscope, and so the spherical aberration of any further lenses has little deleterious effect. Most modern instruments contain (at least) two further lenses, the *intermediate lens* and the *projector*, which further magnify the image which is finally formed on a *fluorescent screen* within the evacuated microscope column. This screen can be seen through portholes in the side of the microscope; when an interesting region of the specimen has been focused on to the screen, the latter can be folded out of the way, and the electrons then fall on to a *camera*, situated in the vacuum behind the screen. Electrons affect certain types of photographic emulsion directly, thus providing a record of the electron image called an *electron micrograph*.

3. Resolution and Magnification.

Resolution.

We have seen that the wavelengths used in electron microscopes are of the order of 0·05 Å. Atoms in crystalline structures are typically a few Å apart, and it might seem, therefore, that everything on the atomic scale and bigger should be easily visible. Unlike the case of the light microscope, the resolving power of the electron microscope is limited not by the wavelength but by the *aberrations* of the lenses, and we must now consider these. The chromatic aberration we have already mentioned. The other defects that cause trouble are the spherical aberration of the objective and the distortion, mainly associated with the projector, which alters the shape of the image although it is still sharp. Spherical aberration (which occurs also in glass optical lenses) can be described as follows: when a broad parallel beam of electrons falls on the objective the outer electrons are more rapidly converged than those nearer the axis, so that instead of all the electrons coming to a point focus, the best that can be said is that they all pass through a small disc near where the point focus should be. To overcome this, a slender beam of electrons is used, but it cannot be too slender because there comes a point at which a conflicting effect, the diffraction limitation, comes in to prevent any further advantage being g[illegible]ned in this way. There is an optimum value bet[illegible] the two extremes, at which the resolving [illegible] is about 3 or 4 Å in a good instrument. [illegible] is about a hundred times the wavelength, so that if light microscopes suffered from a similar limitation, their limit of resolution would be about fifty times worse than it actually is.

Magnification.

The magnification of a light microscope is determined by the lenses with which it is equipped, for the focal length of a glass lens is fixed once the lens has been ground. The focal lengths of electron lenses are determined not only by their geometry but also by the current that flows in their windings, so that by altering this current the focal length can be varied at will. The magnification of an electron microscope can therefore be varied continuously, and the observer can inspect his specimen first at low magnification, × 20,000 for example, and then examine regions of interest at much higher magnification, up to × 500,000. At the latter value, a feature of the specimen 5 Å across will be ¼ mm. in size on the fluorescent screen. Any further enlargement that is required can be achieved photographically.

4. Other Ways of Using the Microscope.

Electron Diffraction.

When a beam of electrons falls upon an array of atoms such as a crystal (*see* F17), each atom modifies or scatters the beam. The combined influence of the whole array imposes on the beam a certain pattern of intensity. The pattern is related directly to the arrangement of the atoms in space and it is called a diffraction pattern. With practice, one can derive much information about the structure of matter from these patterns.

Hitherto we have considered the electron microscope solely as a device for producing magnified images, but microscopes are designed so that diffraction patterns can also be formed directly on the fluorescent screen. The pattern is formed by a selected region of the specimen, and an image of the corresponding zone can also be formed very easily. The diffraction pattern is initially formed near the image focal plane of the objective lens, so that if this plane is focused on to the fluorescent screen by the intermediate and projector lens (instead of the plane in which the objective forms an image of the specimen), a magnified image of the diffraction pattern will be seen by the observer.

Scanning Electron Microscopy.

One way of avoiding the need to use very thin specimens is to fire electrons at a massive specimen in such a way that a small spot of electrons is concentrated on its surface. This spot can be moved across the surface in a regular way, so that if "information" can be obtained from each

point a composite image can be built up like a television picture. This is the reason why scanning facilities are often attached to microscopes, and the information may be gained either from the electrons that are knocked out of the specimen by the main beam, or from the X-rays which are also created and whose wavelength indicates the nature of the specimen.

5. Recent Developments in Microscope Design.

The most important of these are concerned with the use of higher voltages than 100 kV. and the improvement of lens quality.

The Condenser-objective.

As long ago as 1941, Glaser, one of the most distinguished theoreticians of electron optics, showed that by setting the specimen in the centre of the objective lens and applying so high a current that the focal plane passes through this point, the lens quality could be very high. Technically, such an arrangement is difficult to achieve and only recently have Ruska and Riecke succeeded in building a *condenser-objective* in this way, so named because the magnetic field in front of the specimen helps to condense the electrons on to it.

Superconductivity and Lens Design.

Superconducting materials lose all their electrical resistance when they are cooled to very low temperatures providing the surrounding magnetic field is not too high. A current will therefore flow indefinitely and with no change in magnitude in a superconducting ring. During the 1960s, "hard" superconductors have become available, which allow this current to be high, so that by replacing the windings of an electron lens with a superconducting coil, an extremely stable lens can be produced, free of the chromatic aberration that arises from fluctuations in the lens current. Furthermore, the fields that can be achieved are much higher than those of conventional lenses. This is extremely valuable for high voltage microscopes. The pole-pieces of the lens now function less well, which is a disadvantage, but it may be possible to solve this problem by using the rare earths holmium or dysprosium which continue to respond to higher magnetic fields than ordinary magnetic materials.

Correction of Lens Aberrations.

The round lenses that are always used in microscopes have now reached their limit of perfection, and their spherical aberration cannot be reduced by improving their design. Because of this, lens designers have investigated lenses of other shapes, *quadrupoles* in particular. These behave like spectacle lenses, intended to correct astigmatism, and by combining several of these, together with correctors even more complicated in shape, lenses free of spherical and chromatic aberration can be designed, and a corrector for round lenses has been successfully built in Cambridge.

Other lens correctors are being actively studied. The work in Tübingen on a device that removes from the beam electrons that will blur the image, leaving only those that will contribute to a sharp picture, is particularly promising.

High Voltage Microscopy.

Until the mid-1960s, the highest voltage provided on commercial microscopes was 100 kV., but there are advantages to be gained by exceeding this. Faster electrons can pass through thicker specimens, and thus allow us to look at substances in a form closer to their natural state. The biologist could enclose a live specimen in a capsule, and observe its structure, whereas the need for very thin specimens at lower voltages has always forced him to study dead material. Alternatively, it might be possible to study finer details in a thin specimen at higher voltages than at 100 kV., since the resolution should be better. The first high voltage microscope, which is still the most powerful yet built, is in Toulouse, and was planned by Dupouy. It can go up to 1½ million volts, and has so far been used mostly by metallurgists. A high voltage microscope (¾ million volts) is in operation in Cambridge, and 1-million-volt instruments are commercially available in Japan. In the U.S.A., a 5-million-volt instrument has been proposed for the Argonne National Laboratory, near Chicago.

6. Some Achievements of the Electron Microscope.

Before electron microscopes were available, the biologist could hardly hope to study details of organisms smaller than about 1/1000 mm. The smallest unit of living tissue is the cell, and once the structure of the cell had been thoroughly studied and the main ingredients were all known, further progress was difficult. With an electron microscope, however, it is now possible to study the *ultrastructure* of the cell, the structure of its individual elements, and this has shed a great deal of light on the way in which cells divide to produce fully-grown plants or animals from pairs of parent germ cells. [*See* **The Cell, Part II.**]

To the metallurgist, too, the electron microscope has revealed details of the structure of solid materials that could have been discovered in no other way. With X-rays, the general arrangement of the atoms in a metal or crystal can be determined, but with an electron microscope the local structure can be observed, almost on the atomic scale; this has led to a study of the imperfections in the lattice structures of crystals, such as the *dislocations* [*see* **F17**]. Magnetic materials make particularly interesting subjects for electron microscopy, for the electron beam is affected by the local magnetic fields in the specimen; the study of the resulting deflection is known as *Lorentz microscopy* and the technique has provided much new information about the nature of magnetism in ferromagnetic substances.

THE MAGNETISM OF THE EARTH.

1. Introduction.

It has been known since very early times that an iron needle, suspended freely to hang horizontally when not magnetised, comes to rest roughly along the geographical North-South line when magnetised. Further, it generally does not hang horizontally. This is the essential behaviour of the *compass*, a navigational instrument whose invention is obscure but which seems to have been known to the Chinese 4,500 years ago. That the behaviour of the compass shows the existence of a *magnetic field* associated with the Earth was first fully recognised by William Gilbert in 1600. Many of the properties of the Earth's magnetic field are now well documented but its origin is still the subject of considerable controversy.

2. Details of the Field.

Gilbert recognised that the Earth's magnetic field is very closely similar in form to that of a uniformly magnetised sphere. Put another way, the observed field could be reproduced fairly accurately by supposing a hypothetical massive dipole (or bar magnet) to be placed at the centre of the Earth. The axis of this hypothetical magnet would need to be inclined at an angle of about 11° 4′ to the rotation axis of the Earth. The maximum value of the Earth's field at the surface of the Earth is about 0·7 gauss, located at the North and at the South magnetic poles, which do not coincide exactly with the geographical poles. (The gauss is the unit of magnetic induction in

the c.g.s. system; the number of lines of magnetic force passing perpendicularly through unit area). Thus the North magnetic pole is located at present at about latitude 78° 6′ North and longitude 70° 1′ West—*i.e.*, somewhere in northern Canada. On the equator, the field has a strength of about 0·3 gauss, or rather less than half the value at the pole. For a true dipole field this ratio would be exactly one half.

It is seen that the Earth's field has about one-hundredth the strength of a magnet suitable for picking up pins, and less than one-ten thousandth the strength of a usual laboratory electromagnet. By many standards, our concern here is with a very weak field, but it is one of enormous consequence for our everyday life on Earth.

(a) *The Magnetic Elements.*

The magnetic force field F at any point, with which the Earth affects the direction of the compass, can be separated into a number of *magnetic elements* introduced as follows. The component

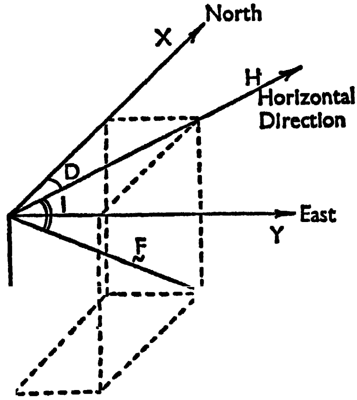

Fig. 1—The Magnetic Elements.

of the field F in the Northward direction is conventionally denoted by X; that Eastwards by Y; and that vertically *downwards* by Z. The component of F in the horizontal direction is denoted by H. The vertical plane containing both the total force F and the horizontal component H is called the *inclination* or *dip* angle, I: the angle between the magnetic meridian and the geographical true North is called the *declination*, D. These magnetic elements are set out schematically in Fig. 1.

(b) *Magnetic Charts.*

It is convenient, and now also conventional, to construct so called *magnetic charts* for any chosen magnetic element by marking the appropriate value of the element in question at different locations on a map of the Earth and joining together the points showing the same value of this element. Lines of equal inclination are called *isoclinics*; lines of equal value of the force F, or of its components (H, X, Y, Z), are called *isodynamics*. The first world magnetic chart was constructed by Edmund Halley (1701), including also the ocean regions. Less accurate information can be inferred (using also old ships' logs) before this, although more reliable data referring to one or two specific locations (like London (Kew) and Paris) is known back to about the middle of the 16th cent. The problem of collecting world-wide magnetic data still remains a vital one, involving close international co-operation. Special efforts at obtaining extensive coverage, and involving temporary observatory sites, are a feature of the International Geophysical Years that are now held every few years. Large electronic computers play a vital rôle in the enormous task of analysing the mass of data collected in such surveys.

(c) *Uniformly Magnetised Sphere.*

The magnetic field due to a uniformly magnetised sphere is particularly simple. For such a magnetic field, the magnetic elements (H, Z, I, and F) each have a constant value for a given latitude relative to the axis of the equivalent magnet. The values of H, Z and F are proportional directly to the strength of magnetisation of the sphere.

The magnetic poles are those two diametrically opposite points where H is zero; the magnetic field has only a vertical component there and the dip angle is 90°. The magnetic equator is the line of constant latitude where the vertical component Z vanishes, the field having only a horizontal component which is not zero. The ratio of the values of Z and H at the pole and the equator respectively is exactly 2:1.

(d) *Comparison with the Observed Field.*

The observed field differs from that of a uniformly magnetised sphere in a number of small but important ways. Thus, (H, Z, F) are not constant for a given latitude but vary by 10 per cent or more. Again, the poles are not truly points, neither are they exactly diametrically opposite to each other nor of exactly equal strengths (the North pole at present being a little over 1 per cent stronger than the South pole). It is significant that the deviations of the actual field from the simple dipole form cannot be linked with any geographical distribution of land or ocean on the Earth's surface.

3. Time-Dependence of the Field.

Gillibrand (1635) produced evidence to show that the magnetic properties at each terrestrial location are not constant but vary with the time. This is the so-called secular variation, the magnetic elements undergoing significant change over a period of a hundred years or more. Small changes of very much shorter duration (the non-secular variations) were later recognised by Graham 1722); careful and extended study of the small movements of a compass show a predictable daily variation together with a superposed irregular movement which may vary over the space of an hour (now called a magnetic storm when particularly strong). These non-secular diurnal and irregular magnetic variations are characteristically only about one-hundred-thousandth as strong as the main dipole field. These very fine details of the total field have proved to be of extreme importance and are now studied most carefully.

(a) *The Secular Variation.*

The change of the magnetic field with time can be displayed by constructing magnetic charts where locations of equal change of magnetic element are joined by a line. The variation is positive (increasing) in some areas but negative (decreasing) in others. This change usually continues in a given direction for up to a hundred years or more, after which its sign changes. The average rate of change of field strength is about 0·00001 gauss per year, but there are regions of considerable variation from this mean value. Of especial interest are two areas in Antarctica, one positive with about 20 times the average value while the other is negative and about 10 times the average value. The local declination and dip angles also vary over the Earth: as an example, at Kew between the years 1580 and 1800 the declination changed steadily from about 11° E. to about 24° W.

A characteristic feature of the secular variation (discovered by Halley in 1692) is its general movement *westwards*, relative to the terrestrial surface geography, by an average of about 0° 2′ per year. But again, there are considerable fluctuations about the average value at different regions of the Earth. The dipole field itself also appears to move though less is known about this than about the secular variation. It seems that the strength of the dipole field itself has decreased by some 5 per cent over the last 100 years although it may have begun to increase again since about 1950.

Like the gross features of the total magnetic field, those of the secular variation field are not linked with geographical surface features and the overall dimensions are broadly larger than those of the land masses. The significance of this observation will be apparent later.

(b) *Field Reversals.*

The existence of remanent magnetism (paleomagnetism) in certain igneous and sedimentary rocks is taken as evidence for the existence of a terrestial field in the remote past. Data are now available for a wide range of rock samples of different ages over many regions of the globe. The direction of magnetisation in rocks of given age may be the same as that of the present field, but in some ages the direction of the field appears to have been reversed, the North magnetic pole becoming the South magnetic pole and *vice versa.* The same consistent conclusions apply for both land and ocean locations. These results, treated statistically, lead to the result that the dipole field has suffered polarity reversals many times in the past, the changes occurring relatively rapidly and at irregular time intervals. The present polarity would seem to have existed for a half a million years or so. Many more data are required before the picture is clear in detail but the general conclusion would seem well established.

(c) *Pole Wander.*

If the main component of the terrestrial field in the remote past is supposed to be dipolar, the presently observed remanent field directions can be used statistically to infer a corresponding location for the magnetic poles. It appears that the geographical location of the poles has suffered a wide systematic movement in the past. It is known that the present pole positions are not exactly fixed and present observed rates of change of position are consistent with those deduced from paleomagnetism. By comparing the polar locations deduced from different land masses it has been inferred that a compatible description of the field is possible only if it is accepted that a relative change has occurred in the configuration of the land masses themselves since the Jurassic period (continental drift). Many more detailed measurements are required before these deductions can be put on a truly quantitative footing.

4. Analysis of the Field.

Gauss (1839) showed how the vast range of data for the magnetic field can be analysed mathematically (using the so-called spherical harmonic analysis), and the method is now standard. The method is especially important because it allows for the location of the components of the terrestrial magnetic field to be isolated. It is found in this way that the dipole and secular variation fields are of internal origin, while the non-secular field is of external origin, being located in the Earth's atmosphere.

The diurnal component of the non-secular field can be associated with tidal effects of the atmosphere. The irregular component is especially strong when magnetic conditions on the Sun's surface are particularly marked by sun-spot activity and the solar wind is temporarily enhanced. Conditions are then magnetically disturbed and experience a magnetic storm: radio communications can be upset, and particularly vivid auroral displays (polar lights) observed in the polar latitudes. This dependence on the relative orientation of the Sun, Moon, and Earth, and on the magnetic conditions of the Solar surface, is characteristic of the non-secular component of the terrestrial field: the dipole and secular components do not show this dependence. In what follows we will not be concerned with the non-secular component of the field; for details reference should be made to studies of the upper terrestrial atmosphere.

5. Origin of the Internal Field.

In explaining the occurrence of the Earth's main magnetic field the essential characteristics to be accounted for, apart from the obvious complexity of it, are: its internal origin; its lack of correlation with surface geological features; its secular variation which describe substantial fractional changes over times as short as a hundred years or so; and polarity reversal and pole wander.

Any origin of the field in the crust is virtually excluded by the lack of correlation with surface features, while the time scale of the secular variation (hundreds of years) is incompatible with the known structure of the mantle, where changes would be associated with times of millions of years. Theories that suppose the material of the Earth to be actually ferromagnetic are untenable, because the known temperature below about 25 km is too high for this to be possible (above the Curie temperature) and the intensity of magnetisation in the crust and upper mantle could not (for physical/structural reasons) be sufficiently high to produce the observed field strengths. Arguments can be constructed that suppose the conditions inside the rotating Earth to be associated with charge separation: a magnetic field is then produced by these charges. Such theories would require electrostatic fields within the Earth far above the dielectric strengths of the known materials. And polarity reversal could hardly be accounted for without requiring the direction of rotation itself to change, which is hardly credible. There is no evidence whatever to support a contention that the field arises spontaneously from some hitherto unknown physical relationship between magnetism and rotation of a material body.

The Earth's core region being liquid does however provide conditions that can plausibly provide an external magnetic field of the type actually observed. The core material is almost certainly a good conductor of electricity and so could carry substantial electric currents which have an associated magnetic field. Changes of fluid motion would naturally lead to rapid field changes of the type met with in the secular variation. Indeed, the isomagnetic charts have a form reminiscent of fluid flow patterns and are not unlike meteorological charts of wind directions in the atmosphere. Core motions would remain uncorrelated with surface features; polarity reversal and pole wander could be linked very naturally with changes of the fluid flow régime. The association of the observed main magnetic field with the motion of a liquid core of not very high viscosity is now so strong as to amount to a certainty that the nature of the field is controlled in an essential fashion by the conditions in the liquid core.

6. Conditions in the Core.

The way in which the magnetic field is produced by electric currents in the core is still unknown. There are two problems: one is to show that an electric current distribution could in principle produce the observed field; and the other is to show that such a current distribution is physically realisable in a real situation and does indeed exist in the core. Definite progress has been made in solving the first problem, but virtually no progress has yet been made in solving the second one.

The electric current will flow due to the action of an electromotive force. In the absence of an electromotive force, it is known that the terrestrial magnetic field would decay in about 15,000 years. The present magnetic field has every appearance of being a permanent feature and this appearance is supported by the modern interpretation of the measurements of remanent rock magnetism. The corresponding decay time for the Sun is about 10^{10} years (about the age of the Sun itself) and a similar conclusion would apply for other stars. Predicted decay times for galactic magnetic fields are also at least as great as the estimated life of the galaxy. It appears, then, that a continual source of electromotive force must be found for the Earth (and other planetary bodies) but this is not necessary for stellar and galactic components of the Universe. There are three relevant mechanisms that are possible as a source of electromotive force. One possible mechanism is based on thermoelectric effects, the core and mantle forming a thermojunction of two dissimilar electric conductors at different temperatures. The temperature difference will arise because of temperature differences within the core which result in convective motions of the core material. Another possible mechanism involves electrolytic processes, the mantle acting as an electrolyte in contact with

the metallic core. Both these processes would require larger temperature differences within the core than seem possible on alternative geophysical evidence. Again, the necessary fluid flow patterns within the core would need to be incredibly complicated and it is not clear that they would have any physical interest.

The third mechanism exploits the possibility of the fluid core behaving as a self-exciting dynamo. The core fluid motions give rise to small electric currents and associated weak magnetic fields: these fields then interact with the fluid motions to which they are due, and an amplification process is possible if the electrical conductivity, the size, and the motion of the fluid core material are all suitably inter-related, and if the fluid viscosity is appropriately small. This so-called dynamo theory is based on the analysis of magnetohydrodynamics and appears to offer definite possibilities for development as a method of understanding the nature of the Earth's magnetic field within the already established principles of physics. There seems little doubt in principle that this mechanism can lead to a self-sustained electric current system that is stable under rotation, but the geometry of the associated flow pattern is extremely artificial. So far no pattern of physical interest has been proposed.

The study of the liquid core in connection with the terrestrial magnetic field must involve a knowledge of the heat generation and conduction within the core, because of the need to invoke fluid convection in the production of an electromotive force. In this way it is seen that a study of the Earth's field must be intimately connected with the thermal history of the Earth.

7. Relation to Other Bodies.

The Earth is linked electrically with the Sun, particularly through the Solar Wind, which is the magnetised plasma ejected by the Sun in all directions. As the plasma bathes the neighbourhood of the Earth it distorts the terrestrial magnetic field in the line joining the centres of the Sun and Earth (*see* Fig. 2). The field is essentially unaffected in the direction at right angles to this line. This field pattern can be understood theoretically and has been shown in practice over recent years using rocket probes and space vehicles.

Bodies other than the Earth might be expected to be the source of a magnetic field; indeed, magnetic fields pervade the Universe quite widely. Within the Solar System, it has been known for a long time that the Sun has a general magnetic field of broadly dipolar type, with an axis making an angle of about 4° with the rotation axis. It is now known, however, that this field is considerably more complex than was thought at one time. Among the planets, only Jupiter can be associated at the present time with unambiguous evidence for the existence of a magnetic dipole field. Venus, Mars, and Moon have not shown a field, to the limits of present measurement: if they do possess a permanent field it must be very small compared with that of the Earth. More information here can be expected only when detailed measurements become possible on the surface of these bodies, and theoretical conclusions can be developed only when definite information becomes available about their structure, presumably as a result of seismic studies. It is not clear whether they possess a liquid core at all; and if they do, its size may not be large enough, or the convective motion in the presence of the rotation forces strong enough, or the electrical conductivity large enough, to allow an electric current system to be maintained in the deep interior. Presumably conditions in Jupiter are suitable; certainly, the size is probably great enough and the planet rotates very fast about its axis.

It is seen that our understanding of the main magnetic field of the Earth is yet far from complete. Further progress can be expected as our knowledge of the Earth's structure improves and paleo-data become both more abundant and more reliable. An important development in the study will be the accumulation of data from other planetary members of the Solar System as one aspect of space exploration.

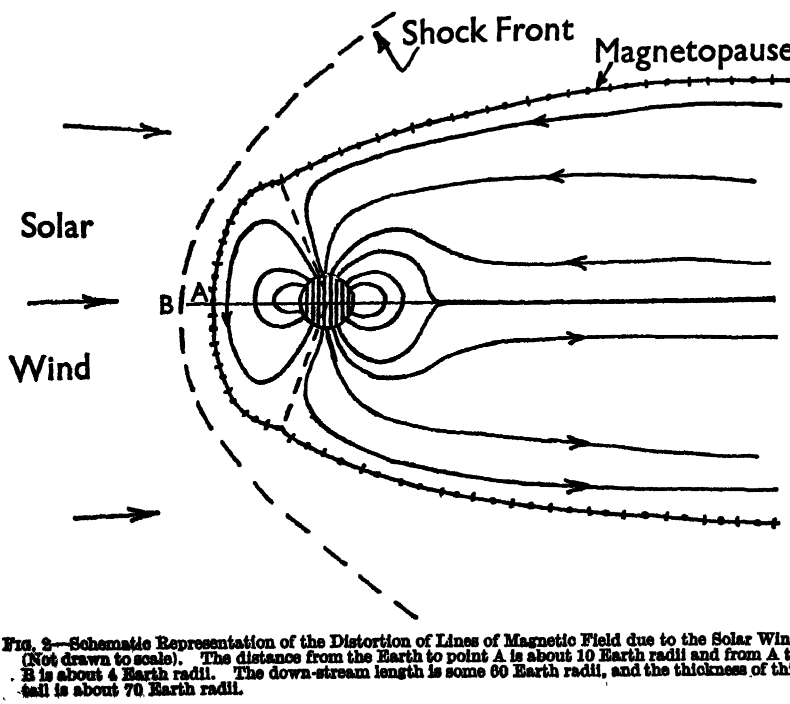

FIG. 2—Schematic Representation of the Distortion of Lines of Magnetic Field due to the Solar Wind (Not drawn to scale). The distance from the Earth to point A is about 10 Earth radii and from A to B is about 4 Earth radii. The down-stream length is some 60 Earth radii, and the thickness of this tail is about 70 Earth radii.

BACKGROUND TO ECONOMIC EVENTS

TABLE OF CONTENTS

BACKGROUND TO ECONOMIC EVENTS

THE aim in this section is to help the ordinary reader to follow economic events as they happen, and to understand the controversy that accompanies them. It is divided into three parts. Part I gives a brief description of the most important problems of economic policy. Part II is concerned with a more detailed survey of the British economy and the way in which it operates. In the course of this survey, the specialised terms used by economists are explained, and the attempt is made to present an intelligible summary of the information, facts, and figures relevant to an understanding of economic events. There are five main sub-sections: International Trade and Payments; Production, Employment, and Industry; Incomes, Wages, and Prices; Money, Banking, and Finance; and Economic Aspects of the Public Services. Some suggestions for further reading are given at the end of Part II. Part III is written as shortly before publication as possible, and contains a survey of developments in the British economy since 1960.

I. CENTRAL PROBLEMS OF ECONOMIC POLICY

Unemployment.

Between the wars, unemployment was Britain's most urgent economic problem. The level of unemployment varied with the ups and downs of the trade cycle. Quite the worst slump was that of the early 1930s: in 1932, nearly 3 million workers were without a job. But unemployment remained high even in the best years, and in no year between 1919 and 1939 were there fewer than a million workers unemployed. Economists make a distinction between *structural* unemployment and *cyclical* unemployment. Structural unemployment appears when the structure of industry gets out of line with the pattern of demand for industrial products. In Britain, unemployment was particularly severe and persistent in areas which were dependent on the coal, textile, and shipbuilding industries, and some sections of the engineering industry. These industries had been in the forefront of Britain's industrial growth in the 19th cent., and had contributed greatly to the expansion of exports. In areas like South Wales, Tyneside, Clydeside, and Northern Ireland there was little alternative work for those no longer needed in the "staple" industries: new industries were being built up in the inter-war period, but they tended to be located in the relatively prosperous Midlands and South-East England. Cyclical unemployment appears when there is a general decline in the level of demand for goods and services, which leads to a decline in the employment of workers producing those goods and services. In the slump years unemployment was so high because of a combination of structural and cyclical unemployment: in the best years, unemployment was largely structural.

Unemployment means waste. Men willing to work, who could produce valuable goods and services, are idle; the economy produces fewer goods and services than it is capable of producing. Unemployment also means hardship and low standards of living for those out of work, and for their families.

The avoidance of mass unemployment has been accepted as a primary objective of economic policy by all political parties, and there is a wide measure of agreement on the policies which must be applied to ensure that unemployment on the scale of the 1930s never occurs again. Cyclical unemployment has to be tackled by measures to increase total demand and total spending by consumers, by investors, and by the Government. Structural unemployment has to be tackled by inducing new industries to move into areas where other employment is declining, or by inducing labour to move from those areas to areas where there is a demand for its services.

There have been ups and downs in unemployment in the post-war years, but these have been very slight compared to those of the pre-war years. In most post-war years, less than 2 per cent of the working population was unemployed—a sharp contrast with the 11 per cent for 1937 and the 22 per cent for 1932. But there are still areas of the country where structural unemployment is serious. In Northern Ireland, for example, despite the efforts which have been made to attract new industries, unemployment ranged between 6 and 10 per cent in the last decade.

Inflation.

A characteristic of the British economy in post-war years has been a persistent rise in prices and money incomes. For example, between 1954 and 1964, retail prices went up by about 35 per cent, or—expressed as an annual rate—by 3·1 per cent per annum, export prices rose by 18 per cent (or 1·6 per cent per annum), and weekly wage rates by about 55 per cent (4·4 per cent per annum). However, these rates of increase were considerably slower than the corresponding rates in the immediately post-war decade. This inflation of prices and money incomes is considered undesirable for two main reasons. Firstly, it is associated with an arbitrary redistribution of purchasing power. Prices rise for everyone, but some members of the community are better placed than others to secure increases in their money incomes which offset, or more than offset, the rise in the price of the goods and services they buy. The feeling that particular groups are falling behind, in that their money incomes have not risen as fast as those of other groups, is a source of much unrest and discontent. Secondly, and crucially for the British economy, an inflation of prices makes it more difficult to achieve a satisfactory balance of payments. As prices of our exports rise, it becomes harder to sell them in foreign markets; and as imports become cheap in comparison with goods produced at home there is a tendency to buy more of them.

Two main explanations have been advanced to account for the inflation which has occurred. The first stresses the role of an excess of demand or spending power in the economy—of too much money chasing too few goods, and so leading to a rise in prices. The inflationary problem is seen as the obverse of the cyclical unemployment problem: the latter involves a deficiency of spending, and the former an excess. Those who consider an excess of demand (*demand-pull*) to be an important factor in the inflationary situation favour policies designed to reduce purchasing power: for example, the reduction of spendable income by levying higher taxes, or the reduction of spending financed through borrowing by making credit more expensive or more difficult to get. The second stresses the role of an excessive increase in incomes: it is argued that prices have risen mainly because costs have increased faster than productivity (*cost-push*). Those who take this view favour measures to restrain or control increases in wages, profits, rents, and other forms of income. Neither explanation excludes the other. Many would agree that both demand-pull and cost-push factors have contributed—with different strengths at different times—to the in-

flationary spiral in prices and incomes, and that measures both to control demand and to restrain or control incomes may be necessary.

But it is easier to specify in general terms the measures needed to combat inflation than it is to apply policies which are successful in practice. In particular, policy measures to restrain or control wage increases are difficult to reconcile with widely-accepted procedures of collective bargaining.

The Balance of Payments.

Britain is heavily dependent on imports. This country must import food: it cannot produce enough food within its borders to feed its population. Many of the raw materials necessary for its industry have to be purchased from abroad. Furthermore, some manufactured goods produced in other countries will be purchased because they are cheaper or more attractive than similar goods produced at home. All these goods, and our imports of services, have to be paid for in foreign currency. Foreign currency is earned by exporting goods and services to other countries. It is not, however, considered sufficient to earn enough foreign currency from our exports to pay for our imports. The objective is to earn considerably more than that, so that we have a surplus of foreign currency available to pay off external debts, to build up our external assets by investing abroad, to enable us to lend and give aid to underdeveloped countries, and to increase our foreign exchange resources.

Since the war, our balance of payments position has been precarious. Exports have increased considerably, but so have imports; and the margin of safety has been so narrow that unfavourable turns of events have led to crises in the balance of payments. In several years, our earnings from the export of goods and services have not even been sufficient to cover our payments for imports, and in no year has the surplus been as large as is considered necessary. With the balance of payments delicately poised even in favourable years, and with corrective action necessary in crisis years, economic policies have been much influenced by our foreign trade problems. It is easy to say that most of the problems would disappear, or would become less urgent, if we could achieve a major expansion of our exports. But most export markets are highly competitive, and we cannot expect to sell more unless the price, quality, and terms of delivery of our goods and services are at least as attractive as those of our rivals in export markets.

Economic Growth.

Taking a longer view, the most important objective of internal economic policy must be to raise the standard of living. The standard of living can increase only if more goods and services are produced per head of population. In a fully-employed economy, the main source of increased output is a higher productivity—output per person—of the working population.

Standards of living in this country have been rising: the output of goods and services per head of population increased by about 24 per cent between 1954 and 1964. Nevertheless, many economists are of the opinion that the rate of growth of output and productivity can be, and should be, increased. In particular, they point out that our rate of growth compares unfavourably with that achieved by some other countries. The potentialities for higher productivity are enormous. The U.S.A. has the highest standard of living in the world: in many industries, output per person employed is twice or more that yet attained in this country. In order to achieve a higher level of productivity in this country, more and better machinery and capital equipment will have to be installed; also, work will have to be planned, organised, and controlled in such a way as to make more effective use of labour and machinery.

Underdeveloped Countries.

Britain and the other developed countries of the world have important responsibilities towards the underdeveloped countries. The poorest two-thirds of the world's population account for only a sixth of total world income and output, while two-thirds of world income accrue to the richest sixth of world population, a category which includes Britain. The poorest two-thirds suffer from poverty, hunger, malnutrition, debilitating diseases, and widespread illiteracy. To make matters worse, most of the poor countries are experiencing a rapid growth of population. Output has to rise as fast as population just to prevent standards of living from falling, and an increase in standards of living requires an even faster growth of output.

Few underdeveloped countries can hope to solve the increasing problems they face without active and generous help from developed countries. This help must take many forms. Financial aid in the form of grants or loans, in order to place resources at the disposal of underdeveloped countries which they would otherwise not be able to obtain; technical aid to assist in the solution of the many technical problems which have to be solved; trading policies which do not hinder underdeveloped countries from getting the imports they need or from selling their exports—these are all activities in which Britain must play her part. In particular, of course, Britain must contribute to the development of the underdeveloped countries of the Commonwealth.

The Inter-relationship of Economic Problems.

Each of the problems briefly described above is extremely complex. The difficulties of achieving successful solutions are further aggravated by the fact that the problems are inter-related in such a way that measures which are helpful for one problem can make others more difficult to solve. For example, a reduction of purchasing power might be considered helpful in the control of inflation, and might ease balance of payments problems by reducing—or slowing down the increase of—imports. But it could also lead to an increase in unemployment, and to a slowing down in the rate of growth of the economy. Or again, a reduction in aid to underdeveloped countries could make it easier to balance our external accounts, but such action could hardly be reconciled with our responsibilities towards underdeveloped countries. In the next section, particular aspects of the British economy are considered in some detail; the final section discusses the main features of the development of the economy since 1960.

II. SURVEY OF THE BRITISH ECONOMY

1. INTERNATIONAL TRADE AND PAYMENTS.

Imports and Exports.

In 1964 the United Kingdom bought from abroad goods to the value of £5,514 million, or just over £100 per head. Food is a large item in this bill, accounting for 32 per cent of the total. Fuel, largely oil, costs about 11 per cent, basic materials for industry 31 per cent, and manufactured goods (a category that includes a large number of semi-manufactured goods bought for further processing) 36 per cent. This last category of imports has increased sharply in recent years. In 1954 they represented only 20 per cent in an import bill of only £3,359 million. All this can be seen in the table.

There are three main determinants of the level of British imports. One is the competitiveness of British with foreign producers. Britain imports those commodities which—at the current exchange rate between the pound and foreign currencies—can be bought more cheaply from foreign than from home producers. Secondly, the level of

imports depends on the extent to which free trade is prevented by tariffs on imported goods or by other devices. Thirdly, as total incomes in the economy expand, there is a general increase in the demand for goods and services, including imports. Therefore imports can be expected to vary directly with the total of incomes in the economy, known as the *national income*.

One would expect that the liberalisation of trade since the early 1950s, together with a decline in the competitiveness of British producers, would have produced an expansion of imports relative to national income. In fact imports as a proportion of national income fell from 23 to 21 per cent between 1954 and 1964. The observed decrease must be explained by the sluggish demand for *primary products* such as food and raw materials. The British spend little of their additional income on imported food, and the development of synthetic substitutes and new products has slowed down the growth in demand for raw materials. Moreover, since the demand for primary products of this sort has been sluggish on a world scale, while supply has increased, their price has fallen in relative terms, and this too has reduced the total cost of British imports.

—fell or stagnated in world markets over the decade.

The Volume of Trade.

Superficially it would appear that any improvement in the terms of trade raises the value of British exports relative to imports. However, this is not always true: faster inflation in this country, leading to a more rapid increase in export prices, would harm rather than help the balance of payments. If the prices of our export goods rise faster than the prices of our competitors in overseas markets, it will become progressively more difficult to sell our exports. Conversely, an inflation in Britain will make it progressively more attractive to buy goods produced abroad. Thus between 1954 and 1964 the value of imports grew slightly faster than the value of exports despite the slower growth of import prices than of export prices. This was because the volume of imports increased by 61 per cent and the volume of exports by only 40 per cent. The trade balance may well be helped by a fall in the price of imported primary products; but the balance of trade

UNITED KINGDOM IMPORTS AND EXPORTS.

Imports of goods (c.i.f.)	£ million.		Percentage of total.	
	1954.	1964.	1954.	1964.
Food, drink, and tobacco	1,314	1,773	39	32
Basic materials	1,015	1,119	30	20
Fuels and lubricants	329	585	10	11
Semi-manufactures	513	1,173	15	21
Finished manufactures	174	838	5	15
TOTAL*	3,359	5,514	100	100
Exports of goods (f.o.b.)				
Food, drink, and tobacco	154	283	6	7
Basic materials	101	158	4	4
Fuels and lubricants	151	138	6	3
Metals	338	500	13	12
Engineering products	1,007	1,915	38	45
Textiles	324	275	12	6
Other manufactured goods	490	847	18	20
TOTAL*	2,650	4,254	100	100
Re-exports of imports	98	154	—	—

* The column figures do not add up to the totals because the former exclude postal packages.

Since the exports of one country must be the imports of another, the same factors in reverse, foreign competitiveness, access to foreign markets, and the level of foreign incomes determine the level of British exports. In 1964 these amounted to £4,254 million, of which no less than 83 per cent were manufactures, mainly of engineering products. Thus Britain gains from trade by exporting manufactures, in which she has a *comparative advantage*, in return for food and raw materials, which she is not suited to produce.

The Terms of Trade.

Between 1954 and 1964 the value of British imports rose by 64 per cent and the value of exports by 61 per cent. These changes can be separated into two components, volume and price. Imports rose in price by only 4 per cent, whereas export prices rose by 19 per cent. The ratio of the average price of exports to that of imports is known as the *terms of trade*; and a rise in the price of exports relative to imports indicates an improvement in the terms of trade. Thus when we note in the table that the terms of trade improved by 15 per cent between 1954 and 1964, we mean that in 1964 15 per cent less exports by volume would have been needed to buy the same amount of imports as in 1954. This improvement in the terms of trade reflects the fact that the prices of many primary products—food and raw materials such as wheat, cocoa, rubber, or copper

in manufactures will be worsened by an improvement in their terms of trade.

VISIBLE TRADE: VOLUME AND PRICES.

	1961 = 100.		Percentage increase 1954–64.
	1954.	1964.	
Value			
Imports	76	125	64
Exports	72	116	61
Volume			
Imports	74	119	61
Exports	80	112	40
Price			
Imports	103	107	4
Exports	89	106	19
Terms of trade	116	99	15

Over the decade there was a persistent fall in Britain's share of world exports, from 20·0 per cent of exports of manufactures in 1954 to 13·6 per cent in 1964. Her competitors in export markets—and particularly Germany and Japan—were more successful in expanding their exports. Had the prices of British exports risen less rapidly over this period, Britain's share of world exports would have been higher in 1964.

The Balance of Visible Trade.

The balance of (visible) trade is the difference between exports and imports of goods. It is said to be in *surplus* if exports exceed imports and in *deficit* if imports exceed exports. In estimating the balance of trade it is important that imports and exports be valued on the same basis. The normal method in the trade returns is to measure imports *c.i.f.* (cost, insurance, and freight) and exports *f.o.b.* (free on board). In other words import prices are shown to include the costs of transporting them to Britain, and exports are valued at the prices when loaded in British ports. Our table shows both imports and exports *f.o.b.*

In no year except 1958 was there a surplus in the British balance of trade. Moreover, the deficit was particularly big in certain years, 1951, 1955, 1960, and 1964. The deficit of 1951 was largely due to the Korean war which led to a stockpiling of primary products and a startling increase in their prices. The other three years coincided with booms in the British economy. These were periods of very full employment and high demand which could be met only by increased imports. Moreover, there was a building up of raw material stocks which had been depleted during the preceding upswings of the economy.

Invisible Trade, and the Current Balance of Payments.

The chronic deficit in the balance of visible trade has in normal years been offset by a surplus in the *balance of invisible trade*. This surplus derives from four main groups of transactions. The first covers receipts from non-residents *less* payments to non-residents, for services such as shipping and insurance. The second covers receipts from foreign governments in respect of military bases in the country *less* payments by this country in respect of military bases abroad. The third covers receipts of gifts and grants made to this country, *less* gifts and grants made by this country. The fourth includes all receipts of interest, dividends, and profits earned on overseas investment *less* interest, dividends and profits paid out on foreign investment in this country.

The table shows that in most years the surplus on invisibles exceeded the deficit on visibles, so that Britain earned a surplus on the *current balance of payments*. However, there was a long-run tendency for the surplus on invisibles to decline: net earnings from shipping services fell and Government military expenditure abroad and grants to other countries increased.

The Current Balance of Payments by Regions.

All the figures presented so far refer to Britain's trade with the external world as a whole. These hide a marked pattern of trade. In 1964 just over a third of visible imports and exports came from and went to the countries of the overseas sterling area—comprising the Colonial territories, independent Commonwealth countries other than Canada, British protected states in the Persian Gulf and a few countries such as Burma and South Africa. One reason for Britain's declining share of world trade is that trade within the sterling area has been growing less rapidly than world trade as a whole. Almost 35 per cent of our visible trade was done with Western Europe, and rather less than 17 per cent with North America. The current balance of payments surplus found in normal years is generally made up of a large surplus with sterling area currencies, partially offset by a deficit with all other countries taken together. A deficit with non-sterling area countries persisted throughout the 1950s and into the 1960s.

The Long-term Capital Account.

We have seen that Britain earned a surplus on its current balance of payments in most recent years. Yet it is not sufficient for this country to avoid deficits on its current account. The objective is to earn a substantial surplus in order to finance investment in and lending to other countries—particularly the underdeveloped countries of the Commonwealth; to repay debts to foreign countries which have been incurred; and to build up reserves of gold, dollars, and other currencies which can help to tide us over difficult periods. In fact the objective of the Government was to earn current account surpluses of more than £200 million in normal years; and a surplus of this magnitude was only achieved in the exceptionally favourable year 1958.

Between 1954 and 1964 there was a persistent and growing amount of British private investment abroad. Since private foreign investment in Britain also rose, the *balance of long-term capital transactions* did not show a clear trend. Nevertheless it was generally in deficit to the extent of £100–£200 million. As with current transactions there were considerable regional differences. Usually there was a heavy deficit in long-term capital transactions with the sterling area and only minor imbalance with the rest of the world. Thus in 1965 Britain had a deficit with the sterling area of £307 million and a surplus with the rest of the world of £92 million, giving an overall deficit on long-term capital account of £215 million. The net flow of long-term capital to the sterling area neutralised the current account surplus with the sterling area, equal to £313 million; and this was also the tendency in other years.

CURRENT BALANCE OF PAYMENTS.
(£ million.)

	1951.	1952–54.	1955.	1956–59.	1960.	1961–63.	1964.

Current balance of payments	−419	206	−73	124	−273	62	−412

Monetary Movements.

In 1965 Britain had a current account deficit of £104 million and a deficit on long term capital account of £215 million; implying a deficit in the *balance of current and long-term capital transactions* of £319 million. This balance had to be financed either through an increase in liabilities (for example, an increase in the sterling liabilities held by foreigners, or in short-term loans from the International Monetary Fund) or by a reduction in assets (for example a reduction in the gold and dollar reserves). In fact, the gold and foreign currency reserves actually rose in 1965 by £246 million, but the sterling balances increased by £55 million and our debts to the International Monetary Fund by no less than £499 million. Total recorded net monetary movements to meet the deficit amounted to only £232 million, so that there must have been an unrecorded increase in credit equal to £87 million, known as the *balancing item*. Let us consider each of these "financing" transactions in turn.

The Sterling Balances.

Sterling is an international currency, and governments and individuals may hold balances in sterling (*e.g.*, Treasury bills, Government stocks and bank accounts) for many reasons. Sterling area countries reckon to keep a high proportion of their international trade reserves in the form of sterling balances. It is convenient to hold sterling to finance trading transactions because sterling is widely acceptable in settlement of trading debts. Sterling balances will also be held to the extent that they are considered a profitable and safe way of holding liquid assets. It may be

profitable to hold sterling if the rate of interest paid on balances in London is higher than that paid in other financial centres. And it may be considered safe to hold sterling if the chances of sterling devaluation (which would automatically reduce the value of the balances in terms of any currency which did not devalue) are thought to be remote.

An increase in the sterling balances enables Britain to finance an adverse balance on current plus long-term capital account without reducing the gold and foreign exchange reserves. Conversely, a reduction in sterling balances can impose a drain on reserves even if there is no adverse balance on current plus long-term capital account.

At the end of 1965 sterling balances held by non-residents (excluding the International Monetary Fund) amounted to £3,470 million; far in excess of Britain's reserves of gold and convertible currencies, equal to £1,070 million. Nearly three-quarters of this amount was held by the rest of the sterling area. However, it is unlikely that Britain would be able to finance a persistent deficit in her balance of payments through a progressive increase in the sterling balances: in the long run the sterling balances will probably be reduced—as indeed they were between 1955 and 1965, by some £200 million. Many underdeveloped countries of the sterling area will want to run down their sterling balances in order to help finance the imports required for their development programmes.

Sterling holdings outside the sterling area, and particularly the unofficial (*i.e.*, private) holdings, are highly volatile, in that they may be withdrawn very rapidly if for any reason it is thought less profitable or less safe to hold sterling than some other currency or gold. Since confidence in sterling is weakest (*i.e.* fear that it will be devalued is greatest) when the balance of payments is in deficit, sterling balances tend to move perversely, so accentuating movement in the reserves. Such was the case in the sterling crisis at the end of 1964. It is ironical that Britain's position as an international currency country makes it more and not less difficult to rely on a running down of reserves to meet a temporary deficit in the balance of payments.

Foreign Exchange Reserves.

The gold and convertible currency reserves are used to finance payments abroad which cannot be financed in any other way: they are a last line of defence in international trade. The reserves held in London belong to the sterling area as a whole, and not just to this country. Members of the sterling area are willing to pay into these central reserves some or all of their net earnings of gold and convertible currencies, in exchange for sterling balances. They do this on the understanding that they can, should they wish to do so, call upon the central reserves by exchanging sterling balances for gold and convertible currencies.

The central reserves of gold and foreign currencies amounted to £1,070 million at the end of 1965; a level which, though higher than in many previous post-war years, was felt to be quite inadequate. There are bound to be imbalances in international trade and payments, and the function of these reserves is to tide over temporary imbalances by increasing reserves in favourable periods and running down reserves in unfavourable periods. If reserves are not sufficient to withstand temporary pressures, measures to protect the reserves will have to be taken—*e.g.*, raising Bank Rate and tightening up monetary policies generally—and these measures may create unemployment and recession, and restrict the growth of the economy.

The International Monetary Fund.

The *International Monetary Fund* (IMF) was set up after the war with the objective of working towards free trade at stable exchange rates. Under the original agreement setting up the Fund, members agreed to make their currencies convertible into other currencies and gold at fixed rates of exchange, and agreed not to impose exchange or import controls without the permission of the Fund. Any alteration in the rates of exchange by more than 10 per cent also requires the permission of the Fund. For many years after the war, the imbalances in world trade—and particularly the acute shortage of dollars—were such that many countries had to invoke the clauses in the agreement which permitted them to impose restrictions during a "transitional" period. Although there is still a long way to go before the Fund reaches its objectives, considerable progress towards them was made during the 1950s. The progressive relaxation of exchange and import controls by this country was paralleled in some other countries, and most of the currencies important in world trade and payments were declared convertible.

The function of the Fund is to make foreign exchange resources available to members who run into balance of payments difficulties. Each member country makes a deposit (called its quota) partly in gold and partly in its own currencies, with the Fund. The size of the deposit is fixed in relation to the country's share in world trade. In return, it is granted certain automatic drawing rights, which entitle it to borrow foreign currencies from the Fund. Furthermore, the Fund has power to make larger loans, and to grant stand-by credits to be drawn on if required. Before the Fund will make such loans and credits available, it has to be satisfied that the borrowing country is taking appropriate action to correct the balance of payments disequilibrium.

In 1956, at the time of the Suez crisis, there was a running down of sterling balances, and Britain negotiated a loan of £202 million from the Fund and an even larger stand-by credit. Again in 1964 and 1965, when there was a severe deficit on current and long-term capital account and heavy speculation against sterling, the Government borrowed from the I.M.F. £369 million in 1964 and £499 million in 1965. In this way the country could ride out crises of confidence in sterling without a severe loss of reserves.

Correcting a Deficit.

If an imbalance in the current plus long-term capital account persists, the deficit cannot be met indefinitely from monetary movements. At some stage the Government must take action to remove the deficit. What action can it take? There are a number of alternatives available, each with its advantages and disadvantages, and economic opinion is by no means unanimous on the choice of policy. Let us consider each of these alternatives in turn.

Variation of the Exchange Rate.

The *exchange rate* is the ruling official rate of exchange of pounds for gold and other currencies. It determines the value of British goods in relation to foreign goods. If the pound is devalued in terms of gold and other currencies, British exports (which are paid for in pounds) become cheaper to foreigners and British imports (paid for by purchasing foreign currency) become more expensive to holders of pounds. In this way *devaluation* can improve the British balance of payments position by encouraging exports and discouraging imports.

But there are certain disadvantages attached to devaluation. The prospect of devaluation results in a speculative outflow of foreign funds; and one devaluation may be taken as a sign that there will be further devaluation in the future. Secondly, the sterling area countries—many of them underdeveloped—will suffer a capital loss, because they hold their international reserves largely in the form of sterling rather than gold. Thirdly, the rise in the price of imports of raw materials and consumption goods results in higher costs and prices and then in wage demands to maintain the British standard of living. It is possible that inflation will in this way neutralise the beneficial effects of devaluation.

The pound was devalued in 1949, when an official exchange rate of £1 = \$2·8 was established, and again in 1967, to a rate of £1 = \$2·4.

Exchange Controls and Convertibility.

A currency is fully *convertible* if it can be freely exchanged for any other currency, or for gold, at the ruling official rates of exchange. Exchange controls impose restrictions on convertibility by

limiting the powers of holders of a currency to exchange their holdings for other currencies or gold at the official rate of exchange. For many years after the war, for example, there was a world-wide shortage of dollars: if sterling had been convertible, there would have been a rush to convert sterling into dollars, with the consequence that the dollar reserves of the sterling area would soon have been exhausted. In fact, a premature attempt to establish sterling convertibility in 1947 led to such a drain on reserves that strict exchange controls had to be re-imposed.

Exchange controls on residents can be enforced by requiring that earnings of foreign currencies (*e.g.*, the proceeds from the sale of exports) be handed over to the exchange control authority—the Bank of England acts as the Government's agent—in exchange for sterling; and by permitting the exchange of sterling for foreign currencies (*e.g.*, to enable the purchase of imports) only for transactions approved by the exchange control authority. There was a move towards convertibility of sterling during the 1950s, and the sterling held by non-residents was made fully convertible in 1958. Residents, however, continued to be subject to exchange controls.

By restricting convertibility the Government can make it more difficult for funds to move into or out of sterling. In this way the Government can impede capital movements, *e.g.*, British private investment abroad, or flows of short-term capital; or it can restrict current spending abroad, *e.g.*, on foreign holidays.

Import Controls and Tariffs.

Import controls impose limitations on the quantity or value of goods which are permitted to enter a country: tariffs are duties levied on imported goods so that the price of those goods to consumers in a country is higher than the price received by the foreigners supplying the goods. In the early post-war years, this country maintained strict import controls over a wide range of goods. These were gradually dismantled, until in 1959 the last remaining import controls on goods were abandoned, except on habit-forming drugs and some agricultural products and textiles from the Far East—to give a measure of protection to British producers.

All countries impose tariffs. Some tariffs are primarily intended to raise revenue for the Government, and others are primarily intended to protect home industries by raising the price of competing goods from abroad. The rights of countries to raise tariffs, or to operate tariffs in a discriminatory way (*i.e.*, to offer lower tariffs on goods from some sources than on similar goods from other sources), are closely circumscribed by the rules of the *General Agreement on Tariffs and Trade* (GATT). The object of the GATT is to work towards free trade, especially through a reduction in tariffs. In the post-war period GATT held several major conferences, at which bargaining to reduce tariffs was attended by modest success. The most significant moves towards free trade in this period were on a regional basis.

The disadvantage of introducing import controls or tariffs to correct a deficit in the balance of payments is that the benefits of free trade are lost. Moreover, there is always the possibility of retaliation by Britain's trading partners. Nevertheless, import controls or tariffs may well be preferable to another measure which has been used to correct a deficit, deflation.

Deflation.

Throughout the post-war period the U.K. balance of payments was far from secure. As a result, domestic economic policies were much influenced by balance of payments considerations. Devaluation was turned to only as a last resort. The movement in the 1950s and 1960s was towards greater freedom of trade. By ruling out devaluation and trade restrictions, the authorities had to fall back on *deflation* of the economy to correct periodic deficits. In other words, the Government took measures to discourage demand and so cut back incomes and employment. By reducing demand in general, the authorities secured a fall in demand for imports. However, it was necessary to cut back national income by many times the ensuing fall in imports. Deflation is a painful method of correcting a deficit. Not only does it have a direct effect on the level of incomes and employment, but it is also liable to slow down the rate of growth of the economy. This can happen because deflation can weaken the incentive to expand productive capacity by investing in new plant, machinery, and other capital goods.

The problem which faced British policy-makers attempting to raise the rate of economic growth was this: as total demand for goods and services expands, it is difficult to prevent growth in the demand for imports and diversion of exports to the home market, particularly when home industries reach the limit of their productive capacity. Yet if consequent balance of payments difficulties are met by restrictions on total demand, it is difficult to maintain the investment necessary for growth in the productive capacity of the economy. The main need in the mid-1960s was the same as that at the start of the 1950s: to achieve an expansion of exports relative to imports so as to secure economic growth without running into balance of payments difficulties.

The international monetary system is partly to blame for the British decisions to resort to periodic deflation of the economy. The use of sterling as a reserve currency has subjected the balance of payments to violent swings in short-term capital flows. Moreover, a world-wide shortage of *international liquidity*, *i.e.*, gold and foreign exchange reserves, means that countries have an incentive to maintain a surplus in their balance of payments and so increase their reserves. In this situation surplus countries do not help to correct an imbalance in foreign transactions: the burden of correcting the imbalance is placed on the deficit country. If the Government of the deficit country feels itself unable to devalue its currency or to impose trade restrictions, it has to deflate the economy. The existing international monetary system contains a "deflationary bias," which the IMF has at most only ameliorated.

The European Common Market and the European Free Trade Area.

By the end of the 1950s, Europe was divided into two major trading groups. The Common Market, or *European Economic Community* (EEC) comprised six countries: Belgium, France, Holland, Italy, Luxembourg, and West Germany. The Treaty of Rome (ratified in 1958) envisaged a rapid reduction of tariffs on industrial goods traded between member countries, the formulation of common agricultural policies, the establishment of a uniform external tariff on imports into Common Market countries from the outside world, and a movement towards a closer integration of economic and political policies.

In the protracted negotiations which led up to the Treaty of Rome, Britain had argued in favour of a looser form of association in a Free Trade Area, involving, in the main, a reduction of tariffs on trade within the area. Britain felt that her special relationships with Commonwealth and Sterling Area countries would be compromised if she accepted the principle of a common external tariff; that her agricultural policies were very different from those of some European countries, so that there would be severe difficulties in subscribing to a common agricultural policy; and that proposals for the closer integration of economic and political policies should be considered very cautiously. In the end, agreement could not be reached with the six countries who signed the Treaty of Rome. The idea of a Free Trade Area, however, found support from other countries, and the *European Free Trade Association* (EFTA) was set up with a membership of seven countries: Austria, Denmark, Norway, Portugal, Sweden, Switzerland, and the United Kingdom.

An account of the negotiations for British entry to the EEC in the 1960s is given in Part III.

The Needs of Underdeveloped Countries.

Two-thirds of the world's population live in dire poverty—a poverty which can scarcely be imagined by those accustomed to the standards of living attained in the relatively few developed countries of the world. The alleviation of this poverty is widely recognised as the most important

economic—and indeed political—task of the second half of the twentieth century.

Underdeveloped countries are predominantly agricultural countries, and "subsistence" agriculture is widespread. In subsistence agriculture, the primary object is to produce the food for your own family. Primitive tools and techniques of cultivation are used, and the margin between what can be produced and what is required to support life is narrow: the failure of crops because of drought, or the destruction of crops by floods, can lead to famine unless food is quickly supplied from outside the area affected. Because the margin is so narrow, the surplus from the agricultural sectors which can be exchanged for the products of other sectors is small—which is another way of saying that the demand for the goods and services produced by other sectors—*e.g.*, industry or services—is low. There is a vicious circle in which low productivity is both a cause and an effect of low incomes.

In many countries there is population pressure on the land and much under-employment in the sense that people have insufficient work to keep them occupied for more than part of the day or year. With the application of modern methods of disease control—*e.g.*, the control of malaria through DDT spraying—death rates have tended to fall, while birth rates have remained high. In consequence, some countries are experiencing a very rapid expansion of population: rates of increase of 3 per cent, involving a doubling of population in as little as 24 years, have been recorded. The pressure of population on the land has therefore increased. Less productive land has had to be brought into cultivation, and erosion and loss of fertility have become major problems. A substantial increase in output is required to prevent a fall in *per capita* income as population grows, and an even greater increase is required if living standards are to be improved.

This is an immense problem, and one which most underdeveloped countries will not be able to solve without generous help from developed countries. There are usually considerable potentialities for increasing agricultural output: but before such increases can be achieved new skills have to be mastered and different techniques of production introduced. Schemes of irrigation and flood control, for example, can increase production: but they require heavy investment, and different crops and cropping patterns may have to be introduced if the fullest benefit is to be derived from such schemes. In many countries, too, alternative employment in industry or services has to be created to reduce pressure on land resources, and to meet the demands which higher incomes will generate. Nearly all underdeveloped countries now have development plans: but only a combined and sustained effort by developed and underdeveloped countries can ensure that the plans are successful.

Aid to Underdeveloped Countries.

The gap between the living standards of the underdeveloped areas of the world and of the countries already highly industrialised has tended to widen in the past few years. It was through a growing world recognition of this situation that the 1960s have been designated "The United Nations Development Decade." World inequalities have increased despite a larger flow of economic assistance from the richer to the poorer nations. The total net flow of economic assistance from Western industrial countries to the developing world was over £3,300 million in 1964. Roughly £800 million of this was net private investment, and over £2,500 million official government aid. But whereas total aid increased rapidly in the 1950s, the increase was not continued in the 1960s: total aid in 1964 was no higher than the estimate for 1961. More than half of the official Government aid in 1964 was contributed by the United States; the other principal donors being France, West Germany, and Britain, in that order. The figures for "aid" can be misleading, however, since part of some countries' contributions is political rather than economic in nature.

Aid to underdeveloped countries takes many forms, it serves many purposes, and it is given for many reasons. Underdeveloped countries need aid to provide finance for development projects; to provide foreign exchange with which imports for development purposes can be bought; and to provide the trained [illegible]npower and technical knowledge which they l[illegible]

One form of aid is pri[illegible]ate investment by firms and individuals from dev[illegible]loped countries. These investments—setting up branch factories, for example—are concentrated in those projects which appear profitable to the investor. However, it is a characteristic of underdevelopment that there are few openings for profitable investment. Most of the U.K. private investment overseas, for example, has been concentrated in relatively highly developed countries of the sterling area. Private investment cannot be relied upon to provide an adequate flow of aid.

Donor Governments may finance specific projects, or they may contribute to the general pool of funds available for expenditure by the Governments of underdeveloped countries. But financial aid is not always enough. Most underdeveloped countries need help and advice on planning their development, to ensure that development possibilities are exploited and that scarce resources are used to best advantage. Hence the many schemes for sending out experts by individual countries and by the technical agencies of the United Nations, such as the Food and Agricultural Organisation (FAO), the World Health Organisation (WHO), the International Labour Organisation (ILO), the United Nations Educational, Scientific, and Cultural Organisation (UNESCO), the Technical Assistance Board (UNTAB) and so on. Hence also the schemes for educating and training people from the developing countries in universities and colleges in the developed countries, one of the main strands of the Colombo Plan, the Commonwealth scheme for helping the poorer members in South East Asia. This list could go on, but what is being done is still far below the need. *See also* Section C, Part II.

British Aid.

The table shows how British Government aid to underdeveloped countries has increased in recent years. It was fairly constant before 1957–8 but more than tripled to £211 million in the decade following 1957–58. Aid per capita of the British population nearly tripled, and amounted to £3 16s. per head in 1966–67. However, when

BRITISH GOVERNMENT AID, 1957–58 to 1966–67.

	Total aid.			Multilateral aid. £m.	Bilateral aid.		
	£m.	per capita. £	as a percentage of G.N.P.		Total. £m.	Grants. £m.	Loans. £m.
1957/8	65	1·3	0·33	3	62	50	12
1960/1	147	2·8	0·65	17	130	60	70
1961/2	170	3·2	0·69	14	155	81	74
1962/3	156	2·9	0·61	14	142	74	68
1963/4	173	3·2	0·64	15	158	72	87
1964/5	191	3·5	0·65	16	175	92	83
1965/6	205	3·8	0·66	19	186	93	94
1966/7	211	3·8	0·65	19	192	88	104

aid is expressed as a percentage of the Gross National Product, we see that the percentage increased from 0·33 of one per cent in 1957–8 to 0·65 of one per cent in 1960–1 and has since remained at that level. To be just one per cent of G.N.P., aid would have to be raised by about £100 million. Aid may be divided into multilateral aid and bilateral aid. Multilateral aid is given through the medium of the international institutions, such as the International Bank (IBRD) and the International Development Authority (IDA); bilateral aid is given directly to the developing countries. Mutilateral aid was still only £19 million in 1966–67. The increase in aid since 1957–58 has taken place in bilateral aid. Whereas loans were fairly negligible in 1957–58, they increased rapidly, and exceeded grants from 1964.

It must be remembered in deciding the terms on which Government aid is provided, that the foreign indebtedness of the developing countries is increasing sharply. About four-fifths of British loans is made available for 20 years or more. Normally the rate of interest on these loans is the rate at which the British Government can borrow on the capital market. However, the Government decided in 1965 to make development loans free of interest in appropriate cases. About a third of expenditure on aid is formally tied to the purchase of British goods and services. Other aid is not tied formally, and may be used directly to finance local expenditure; but when it is used to finance imports directly, it has to be spent on British goods if these are available on competitive terms. Multilateral aid is untied. The tying of aid tends to raise the costs to developing countries; but it also enables countries with precarious foreign balances—such as Britain—to be more generous.

Aid takes the form not only of financial but also of technical assistance; underdeveloped countries lack skilled experts, administrators, and teachers as well as capital resources. To coordinate and promote technical assistance the Department of Technical Co-operation (DTC) was set up in 1961. British Government expenditure on technical assistance amounted to £31 million in 1966. At the end of 1966, British technical assistance personnel overseas totalled altogether 15,000 (excluding volunteers recruited by voluntary societies); over 3,000 administrators, 3,400 teachers, 1,300 agricultural advisers, 3,000 industrial and technological advisers, and 1,100 doctors and medical workers.

In the past decisions on aid were made separately by a number of Government bodies—the Treasury, the DTC, the Colonial Office, Commonwealth Relations Office, Foreign Office, and so on. In October 1964 the Government established an Overseas Development Ministry (ODM), through which all British aid is now channelled and coordinated. The Ministry should be more effective in pressing for aid to the developing countries than was the case in the past. The amount of aid which ought to be provided has become a political issue in some countries such as the United States: thankfully this has not occurred in Britain.

The International Bank.

The International Bank for Reconstruction and Development (IBRD) known as the *International Bank* or as the *World Bank*, is an agency of the United Nations established in 1945. It has the primary function of making funds available to assist underdeveloped countries. Member nations agree to subscribe quotas—fixed in much the same way as the quotas for the IMF—to the Bank. In fact, only a small proportion of the quotas has been called up by the Bank: the major part of the Fund's resources are borrowed—on the security of the remainder of the quotas—in financial centres: particularly in New York, but also in London and elsewhere.

Usually, loans are made to finance specific projects of investment in underdeveloped countries; and the Bank will normally make a loan only if it is satisfied that the investment will yield a revenue sufficient to enable the payment of interest on the loan, and the repayment of the sum lent. In 1964–65 the Bank made loans to the value of about £350 million. Thus a sizeable amount of lending is channelled through the Bank, but it is clear that some projects of great value to underdeveloped countries cannot be financed in this way, because they would not yield returns quickly or large enough to meet the Bank's stringent requirements for interest and repayment. Accordingly a new institution, the *International Development Authority*, was set up in 1960 with the power to make loans at low rates of interest and with more generous repayment conditions. The IDA contributes (but only on a limited scale) towards the development of education and agriculture.

Trade and Development.

Underdeveloped countries are faced with a shortage of foreign exchange to pay for the imports—plant, machinery, and raw materials—required for development; and they are also faced with the problem of fluctuations in their foreign exchange receipts. The exports of underdeveloped countries at present consist largely of primary products. The prices of these primary products fluctuated considerably in the post-war period, but the general trend was for falling prices. This was an important cause of the improvement in Britain's terms of trade (*see* G6(1)). The reverse of the coin was a deterioration in the terms of trade of many underdeveloped countries, who were able to buy fewer imports for a given quantity of exports. Primary commodities exported by developing countries—such as coffee, cocoa, sugar, wool, cotton, jute, rubber, and mineral ores—decreased in price on average by about 16 per cent over the period 1957–62.

In 1964 the United Nations Conference on Trade and Development (UNCTAD) was held to discuss these matters. For the first time the poorer nations of the world—77 were represented—came together to act as a pressure group on trading matters. The Conference made the following recommendations. Developing countries should be given freer access to world markets for their manufactures and semi-manufactures by the elimination of quotas and tariffs. International commodity agreements should be made for each major primary commodity in world trade, to stabilise commodity prices. Compensation schemes—whereby countries are compensated for the declining prices of their primary products—were recommended for consideration. The conference also resolved that the developed countries should aim to provide at least 1 per cent of their national income aid as for the underdeveloped countries.

2. EMPLOYMENT, PRODUCTION AND INVESTMENT.

Population.

In June 1965 the population of the United Kingdom was estimated to be 54·4 million–47·8 million in England and Wales, 5·2 million in Scotland, and 1·5 million in Northern Ireland. The total was still rising slowly, at a rate of about 0·7 per cent per annum. Prediction of future trends is difficult. Before the war it was common to predict that Britain's population would fall later in the century; but these predictions were made at a time when the birth-rate was very low. Since then the birth-rate has risen sharply, and the *net reproduction rate* (the ratio of the birth-rate of girls less their infant mortality to the population of women of child-bearing age) has been above one in most years since the war. There are several possible explanations of the high birth-rate, the most important being the rapidly falling age of marriage, which makes it difficult to say whether the birth-rate will be maintained. In the near future population will certainly continue to rise slowly as improving medical services raise the average length of life and as the gap between generations shortens.

The Population of Working Age.

Of the total population only some are of working age. Working age is defined as the period between the minimum school leaving age of 15 and retiring age—65 for men and 60 for women. Of course, not all those of working age do work and not all those above working age have retired; nevertheless the ratio between population not of working

age and the total is a useful statistic, as it does provide a rough guide to the numbers who have to be supported out of the current national income, but who do not contribute to it. This ratio is rising and will continue to rise. In 1965, 23·3 per cent of the UK population was below working age and 15·0 per cent above. By 1980 it is fairly certain that 16 per cent of the population will be above working age; and much more speculatively, it is guessed that 26 per cent will be below. So the population not of working age will rise from 38·3 to 42 per cent. The expected growth in the proportion of the old explains why the proportion on pensions (*see* G26(2)) is going to grow steadily. More generally, it is clear that some growth in output per worker will be needed to meet the needs of the increasing proportion of dependants.

The Working Population.

Not all persons of working age actually work, although the vast majority do: but only a part are gainfully employed, *i.e.*, work for wages, salaries, and profits. And it is only those who are gainfully employed who are counted in the working population. Housewives, mothers, and those who give their services gratis to good causes are excluded, unless they also do some work for cash. In 1965, when the total population of Great Britain was 53 million, of whom 32·7 million were of working age, the total working population (including the unemployed who are seeking employment) was only 25·5 million. Of the 17·5 million women of working age only 8·8 million were gainfully employed. So for every person gainfully occupied there was just over one other person to be supported out of the goods and services they provided. One feature of the post-war years was a steady increase in the proportion of persons going out to work. Whereas in 1965, 78 per cent of the working-age population was gainfully employed, in 1955 the figure was only 66 per cent.

or less inevitable. Some seasonal rise in unemployment in the winter must be expected, *e.g.*, in seaside towns, and for this reason unemployment in January is half a per cent or so higher than in June. Moreover, some unemployment is bound to be involved in job-changing and as the demands of industries change. "Full employment" means that there should be about as many jobs vacant as there are workers looking for jobs. A large excess of vacancies is evidence of inflationary pressure in the labour market, for it means that the employers needing workers to meet the demands for their products will have to compete with each other by bidding up wages.

To some extent unemployment figures are misleading, as not all unemployed workers are eligible for unemployment benefit under the National Insurance Scheme. Most married women who go out to work normally opt not to pay the full National Insurance contributions, so that, when they become unemployed, they just drop out of the "working population". Unemployment figures definitely understate the seriousness of recessions, as they do not count all the persons who would like to have, but cannot find, jobs.

Of the 317,000 persons unemployed in mid-1964, 240,000 were men and 77,000 women. Of the men, over half, 147,000, had been unemployed for over eight weeks. Thus long-term unemployment was nearly 1 per cent of the labour force, serious enough for those affected but not the kind of unemployment to be cured easily by reflationary measures.

Regional Unemployment.

A peculiarly dreadful feature of the inter-war years was the emergence of the depressed areas—the regions of the country where a third of the men had not had a job for a year or more. Such extreme regional unemployment has not recurred since 1945: only in Northern Ireland was unemployment very high. Between 1954 and 1964

DISTRIBUTION OF WORKING POPULATION, JUNE 1965.
(Thousands.)

Basic Industries.		Manufacturing Industries.		Services.	
Agriculture and fishing	486	Food, drink, and tobacco	810	Distribution trades	2,961
Mining and quarrying	624	Chemicals and allied industries	515	Financial, professional, and scientific services	3,045
Construction	1,656	Metal manufacture	632	Catering, hotels, etc.	612
Gas, electricity, and water	411	Vehicles	862	Public administration:	
Transport and communication	1,628	Engineering and other metal goods	2,848	National	545
		Textiles	767	Local	758
		Paper printing and publishing	633	Miscellaneous	1,574
		Other manufacturing	1,779		
Total	4,805	Total	8,846	Total	9,495
Percentage of working population	*20·8*		*38·2*		*41·0*

Most of the working population work for wages or salaries as employees. Of the total for Great Britain in June 1965 of 25·5 million, 1·7 million were employers or self-employed, 0·4 million were in the Forces, and 23·4 million were either employees or unemployed persons looking for work. The table shows the industries in which people work. Some 38 per cent of the total work in manufacturing industry, 2·8 million of these in engineering and allied industries, 21 per cent work in the basic industries, and the remaining 41 per cent are in the so-called service industries.

Employment and Unemployment.

In 1965 an average of 329,000 persons—1·4 per cent of the working population—were unemployed. Even in January 1959, the worst month of the 1950s, the rate rose only to 2·8 per cent, and in February 1963—an exceptional month—to 3·9 per cent. In most post-war years the average was lower than 1·5 per cent. This contrasts with an average figure in 1937, the best year of the 1930s, of 11 per cent, and with a figure of 22 per cent at the bottom of the slump in 1932. Probably 1–1·5 per cent is somewhere near the practicable minimum; for some unemployment is more

unemployment there ranged between 6 and 10 per cent. Nevertheless, regional inequalities exist, and much attention has been paid to this problem in recent years.

UNEMPLOYMENT AND VACANCIES.
(Great Britain, thousands.)

	Unemployment. (Annual average.)	Vacancies. (End of period.)	Unemployment as percentage of total employees.
1932*	2,829	n.a.	*22·1*
1937*	1,482	n.a.	*10·9*
1954	285	338	*1·3*
1956	257	279	*1·2*
1958	457	163	*2·1*
1960	360	294	*1·6*
1962	463	157	*2·0*
1964	381	311	*1·6*

* Figures relate only to population insured against unemployment.

PERCENTAGE OF WORKERS UNEMPLOYED, BY REGIONS.

	February 1963.	February 1965.
London and South-eastern	2·3	1·0
Eastern and Southern	3·6	1·2
South-western	3·8	1·8
Midlands	3·4	0·8
Yorkshire and Lincolnshire	3·3	1·2
North-western	4·1	1·8
Northern	7·1	3·1
Scotland	6·2	3·6
Wales	6·0	2·8
North Ireland	11·2	6·9
Great Britain	*3·9*	*1·6*

DECREASE IN EMPLOYMENT IN SELECTED INDUSTRIES, 1945–65.

	Thousands.	Per cent.
Textiles	224	23
Mining and quarrying	242	28
Shipbuilding	77	27
Agriculture, forestry, and fishing	221	21

In February 1963—during a period of recession and also cold weather—the percentage of all workers unemployed in Great Britain was 3·9. But the table shows a lower proportion of the labour force was unemployed in the Midlands and the South, and that there was a much higher percentage of unemployment in the North, in Scotland, and in Northern Ireland. Moreover, the labour shortage of early 1965 was not shared equally: unemployment remained significant in these areas. In this situation checks have to be placed on the economy before full employment is reached, because in the booming areas vacancies far exceed unemployment.

One of the main reasons for the regional pattern of unemployment is that certain industries and services, in which big changes have been taking place, tend to be grouped in specific regions. Most of our early industrial centres had to be established close to coal, iron ore, and adequate water supplies. But employment in many long-established industries has recently been declining. The scale of this contraction can be seen from the table. On the other hand new and growing industries, and their related offices, have been concentrated in Greater London, the South East, and the Midlands. The growth of services, too, has centred on the areas where industry is booming and population is increasing. In the absence of Government intervention, the process would tend to become cumulative, and regional inequalities would grow rather than diminish.

National Income.

Gross domestic income (GDY) is the sum total of incomes received for the services of labour, land, or capital in a country. Gross domestic product (GDP) is the money value of all the goods and services produced in the country. So as to avoid double-counting, only the *value added* at each stage of production is included: firms' purchases are excluded. The revenue from selling the GDP is either paid out to the hired factors of production—labour, land, and capital—or retained in the form of profits. Therefore, provided it is calculated net of taxes on goods produced, GDP must equal GDY. To estimate gross national income from GDY it is necessary to add the net income—such as profits and interest—received from abroad. If an allowance is made for wear and tear of the nation's capital equipment, *i.e.*, for *capital consumption*, we arrive at net national income, better known as the *national income*.

In 1965 the national income of the United Kingdom was £28,280 million, implying a national income per head of £518. In 1955 the corresponding figures had been £15,514 million and £303 per head. However, only part of this increase in value was due to an increase in the quantity of goods and services produced; some of the increase simply reflected a rise in prices. It is important to calculate changes in the volume of output—known as *real output*—as well as changes in its value. Real output is calculated by the statistical device of constructing an index number. This is done by calculating the volume of goods and services provided in each year and then valuing these goods and services at the prices found in one particular year. Thus between 1955 and 1965 the money value of national income rose by 82 per cent; whereas real output increased by only 33 per cent, and the difference represented a rise in prices.

In real terms national income per head rose by 24 per cent between 1955 and 1965, or by 2·2 per cent per annum. National income per head is the most useful indicator of the standard of living. However, this measure is necessarily a crude one. For instance, it cannot take account of new products, *e.g.*, television or the plastic bucket; nor of changes in the distribution of income between rich and the poor; nor of the "quality of life," affected by such things as traffic jams and smokeless zones; nor of the length of the working week.

Industrial Production.

It is fairly easy to measure output in the main manufacturing industries, and in many of the basic industries. It is much more difficult to do so for the service industries: the output of a doctor or a teacher is not easily measured. So each month the Central Statistical Office calculates the *index of industrial production* covering the main "productive" industries. However, this tends to give a false impression of the rate of growth of output, since the industrial sector is the one best placed to raise its output per head and for which demand expands most rapidly. Roughly a 5 per cent increase in industrial output is likely to be accompanied by a 3 per cent increase in GDP, on which the average standard of living depends.

Manufacturing industry accounts for more than three-quarters of industrial production. Within manufacturing industry two industries have expanded most rapidly—chemicals, which includes drugs, plastics, cosmetics, detergents, and oil refining; and vehicles, which includes cars, tractors, commercial vehicles, and aircraft. The slowest growing manufacturing industries are textiles and shipbuilding, which are losing their markets to cheaper competitors. Those industries in which demand has stagnated are also the industries in which output per employee, *i.e.*, productivity, has stagnated.

International Comparisons.

Between 1955 and 1964 Britain's GDP grew less rapidly than that of any other country listed in the table, except the U.S.A. The British economy was also characterised by a relatively slow growth of output per head, *i.e.*, productivity. Many explanations of Britain's poor performance have been suggested, and there is by no means agreement on this matter among economists. It has been argued that the U.K.—like the U.S.A.—has a highly advanced economy, in which there is a relatively high demand for services; and that it is difficult to raise productivity in the large services sector. Another argument is that Britain has been hampered by its slowly growing labour force, which has restricted growth not only in output but also in output per man. The reason given is that an expanding labour force needs to be equipped with additional plant and machinery; so that its capital equipment tends to be newer on average than that used by a static labour force, and thus more up-to-date and efficient.

Some commentators have put the blame on the inefficiency of our business management; some on our educational system, biased towards the humanities; some on the social milieu which looks down on money-making as a career; some on over-manning and other restrictive practices of trade unions. A good deal of attention has

AN INTERNATIONAL GROWTH LEAGUE TABLE.

	Percentage change per annum, 1955–1964.			Investment as percentage of G.N.P.	
	Output.	Employment.	Output per head.	Including dwellings.	Excluding dwellings.
Japan	10·4	1·4	8·8	28·8	21·5
W. Germany	6·3	1·3	5·0	23·7	18·4
Italy	5·7	0·1	5·6	21·6	15·6
Sweden	5·4	1·5	3·9	22·8	17·4
France	5·2	0·3	4·9	19·2	14·3
Denmark	5·0	1·2	3·8	18·7	15·4
Belgium	3·6	0·6	3·0	18·4	13·7
U.S.A.	3·1	1·1	2·0	17·1	12·2
U.K.	3·1	0·5	2·6	15·8	12·7

also been paid to the proportion of output which different countries devote to *investment, i.e.*, expenditure on commodities—such as plant and machinery—for use in future production. These investment ratios are shown in the table. With the exception of the U.S.A., all countries have investment ratios considerably higher than in the U.K., with correspondingly higher growth rates of output and productivity. Since investment in dwellings contributes very little to growth, it is appropriate to exclude this investment: however, the same results are obtained. This leads to the hypothesis that Britain's growth rate could be raised if a higher proportion of output were devoted to investment, particularly in plant and machinery. There is probably some truth in many of these explanations, and it is unlikely that any one remedy will be sufficient to raise the British growth rate.

Capital and Automation.

Many of the growing industries are capital-intensive; they use much machinery and equipment per unit of output produced. In chemicals, steel, and, above all, electricity, the plant is extremely expensive. Most of the innovations since the war—nylon, atomic power, electronics, polythene, etc.—require a high capital investment, and cannot pay unless they are worked nearly full-out. One way to achieve this is by shift work, and it may be that a full exploitation of the potentialities of these new industries will require a greater extension of this system of work. And the future holds out prospects of still more intensive requirements for capital as automation spreads. With automation, much of the manual semi-skilled work should come to an end. The new electronic computers will be able to control the machines that actually do the manufacturing operations. "Transfer" machines can read details of the work to be done off a piece of tape; they can adjust themselves to correct mistakes or to adjust for faulty materials.

So far the impact of automation has been small. The main use has been in the office, where electronic computers can carry out far more efficiently much of the routine calculating, recording, and checking operations previously done by clerks. But it will continue to spread, and must do so if the growth in wealth is to continue. The change will come only gradually. But ultimately one can envisage that both in manufacturing industry and in office work the machine will have replaced much of the human effort in work, and even more of its drudgery. The typical manual job will become that of the skilled maintenance man.

This revolution will take many decades to effect. It raises no spectre of widespread redundancy; but it does mean that over the years more and more emphasis will need to be laid on the training of workers for skilled work, and indeed on raising the general level of education. Also over the years the average size of factory is likely to grow as these new methods, if they are to be profitable, have to be used on a large scale. Finally, the prospect is for ever-increasing requirements of capital—and of course for the savings to finance it.

Investment.

In 1965 gross investment in capital assets amounted to £6,252 million. This is about 20 per cent of the gross national product (GNP). In other words, about one part in five of total production was used to replace old assets or to add to the nation's stock of capital equipment. The addition to the stock of capital assets (net investment) accounts for 60 per cent of gross investment; the remainder is needed to offset the wastage of assets already in use. We have seen (above) that the proportion of total output invested in Britain is lower than in countries with faster growth rates of output and productivity; and there is reason to believe that a higher proportion would improve the growth rate. But a rise in the investment ratio would involve a fall in other forms of expenditure, notably private and public consumption; and this would have to be brought about by increasing taxation or encouraging people to save. In other words, a faster rate of growth—and therefore higher consumption in the future—which was achieved by this method would involve a sacrifice in current consumption. A choice must be made between the loss in current consumption and the ensuing gain in future consumption. Of course not all consumption expenditure is equally important to the standard of living: some would argue that if defence expenditure was pruned to permit more investment, there would be no loss to set against the future gain.

Types of Investment.

There are four main kinds of investment: plant and machinery; vehicles; dwellings and other construction. In 1965 the four categories accounted for 37, 10, 21, and 32 per cent respectively of total gross investment. Investment may also be analysed by the purpose for which it is used. It is clear from the table that some sectors are more capital-intensive than others. Manufacturing and social services (such as education and health) take a surprisingly small proportion of total investment; distribution (retail, wholesale, banking, and finance) and public utilities and services take a large proportion. Investment in electricity alone accounts for 10 per cent of the total. Investment in real terms rose most rapidly for social services and for distribution over the decade; manufacturing, other production industries, and transport fared badly.

GROSS INVESTMENT BY PURPOSE, 1965.

	Percentage of total 1965.	Percentage increase 1955–65.
Manufacturing	21	48
Other production industries	7	36
Transport	9	46
Distribution	17	127
Public utilities and services	20	121
Housing	20	62
Other social services	6	155
Total	100	76

The Finance of Investment.

Any business is allowed to charge as a cost the depreciation of its assets. Normal depreciation allowances are based on the original cost of the asset and on its expected useful life. In a time of price inflation depreciation allowances will not provide sufficient finance to permit the replacement of assets at higher prices, and there are many supporters of depreciation allowances being based on replacement costs. Many firms do set aside extra funds specifically to cover these extra replacement costs. However, an official committee of enquiry recommended against a change in practice, and with prices rising less rapidly the issue became less important.

Governments have, however, adopted certain fiscal devices to encourage replacement and investment. Soon after the war initial allowances were introduced. Under this system firms were permitted to charge against profits in the first year of its life 20, or at times 40, per cent of the cost of any new equipment, and the system amounted to a loan of the tax saved in the first year, repaid over the life of the asset. In 1954 initial allowances for machinery were replaced by a system of investment allowances, under which a firm could charge against profits 20 per cent of the cost of any new machine, with the difference that all ordinary depreciation allowances were still chargeable. So the investment allowance was a grant, not a loan, of the saved tax. In 1966 it was announced that initial and investment allowances on new plant and machinery in the key sectors—manufacturing, mining, and shipping—would be replaced by cash grants. Other plant and machinery and industrial building would receive higher initial allowances.

Depreciation allowances and government allowances and grants for investment are sufficient to cover the majority of investment (excluding dwellings) by the private sector, and to cover a minor part of public (non-housing) investment. The residue of investment, and housebuilding, has to be provided from savings. Companies rely mainly on retained profits, which are often larger, taking companies as a whole, than their net investment; and so too do the profit-making nationalised industries. Much public investment must be financed by the Treasury.

Monopoly and Competition.

This trend to increasing size and increasing capitalisation has been going on now for many decades, and in the process it has changed the face of British industry. In the early 19th cent. the typical firm was the owner-managed textile mill. Then in the 1860s and 1870s came the discovery of cheap methods of making steel, with the consequential immense growth in the engineering industries. Most of the chemical industry is still newer—some very new—and in these capital-intensive industries the big firm predominates. In some it has become almost a monopoly; no small firm can easily challenge industrial giants like Imperial Chemical Industries, the Dunlop Rubber Company, or Unilever. In others the pattern is of a few firms, all large, as in motor cars, detergents, and steel. Competition goes on, but it has changed its form. In the old days competition was largely by price. Now it is largely by advertising and by variations in the quality and other features of the product—detergents and motor cars being good examples. And in many industries groups of firms producing similar products entered into agreements which had the effect of restricting competition, for example through schemes for price-fixing.

Legislation against Restrictive Practices.

The Restrictive Practices Act of 1956 outlawed many of the main forms of restrictive agreements to prevent competition. Collective price fixing was declared to be illegal unless the industry could show that the practice brought substantial benefit to the public. Collective price-fixing was the the system under which a central association for the industry lays down minimum prices at which members may sell. Usually such a system was backed by arrangements for collective boycotts, under which members of the association would refuse to sell goods to wholesalers or retailers who broke the rules. Often the wholesalers too were in the scheme, and they would collectively refuse to buy from manufacturers who broke the rules. Collective boycotts were also found in industries without collective price-fixing, one common purpose being to make sure that retailers did not sell a manufacturer's products below his recommended price. This form of collective resale price maintenance was also outlawed by the Act. Under the Act any restrictive agreements of several specified kinds had to be registered with the Registrar of Restrictive Practices. He then had to decide whether there was a *prima facie* case for the discontinuation of the agreement, and, if he thought there was, the case was referred to a new Restrictive Practices Court, containing both judicial and lay members.

The Act of 1956 permitted individual manufacturers to enforce *resale price maintenance* (r.p.m.) for their own products. Few suppliers would want the publicity of enforcing r.p.m. through the courts, but individual suppliers could still put some commercial pressure on price-cutters, *e.g.*, by offering less favourable terms or by refusing them supplies. The Resale Prices Act of 1964 prohibited all methods of enforcing minimum resale prices. However, goods which had been registered in due time with the Registrar of restrictive trading agreements or have been approved by the Restrictive Practices Court, were exempted, temporarily in the former case and permanently in the latter. For r.p.m. to be approved by the Court, it must be shown that some ensuing benefit to consumers (*e.g.*, of increased quality or more retail outlets) outweighed any detriment. It is also lawful to withhold supplies to retailers selling goods at a loss to attract customers. The list of applications for exemption is a long one, but the effect of the Act should be lower prices in the shops. It will also mean a more rapid decline of small retailers.

The Restrictive Practices Acts leave untouched the industries where one firm is dominant: these remain the responsibility of the Monopolies Commission, who report on industries referred to them by the Board of Trade, and make recommendations after investigation. The Monopolies and Mergers Act of 1965 strengthened control over monopolies and mergers. With regard to monopolies, the Government wished to provide itself with legal powers of enforcement: previously monopolies had been expected to comply voluntarily with the findings of the Monopolies Commission. The Act also permits the Government to refer a merger or a proposed merger to the Monopolies Commission in cases where the merger would lead to monopoly (defined as control of at least one third of the market) or would increase the power of an existing monopoly, or where the value of the assets taken over exceeds £5 million. But it would be wrong to presume that mergers are always bad: it is possible that mergers—by facilitating research and other economies of large-scale operation—will increase industrial efficiency. For this reason the Government proposed in 1966 to establish an Industrial Reorganisation Corporation to promote the grouping of firms in cases where such grouping would be beneficial to their industry.

Restrictive labour practices—which result in the "over-manning" of plant or the "under-employment" of men—are common in British industry. These stem from such causes as the fear of redundancy and unemployment, anxiety to preserve a craft skill threatened by technical progress, the desire to work at overtime rates, and sometimes just inertia. In the fully-employed economy of the 1960s, redundancy should not be a problem, and under-employed labour is urgently needed elsewhere. The elimination of these restrictive practices requires more enlightened management, more union co-operation, and more Government measures to promote the mobility of labour between occupations.

Nationalised Industries.

Nationalised industry accounts for about 20 per cent of British industry. Local authorities also run some services—largely in bus transport and water provision. With the exception of coal-

mining, all these industries are natural monopolies in which the provision of competing services would be obviously wasteful. They are thus obvious candidates for nationalisation. With the exception of steel—nationalised 1951–53 and re-nationalised in 1967—nationalisation has not been extended into manufacturing industry, not even where the existence of a private monopoly might suggest that there was a strong case. But nationalised industries are not free from competition. The railways face competition from road transport, some publicly and some privately owned: the fuel industries compete with each other, and with the privately owned oil industry.

Nationalised industries are supposed to earn enough to cover their costs. In the first ten years the two airways corporations were granted subsidies; but these have now ceased. Costs for a nationalised industry include interest payments on capital—both on the compensation paid to the previous owners and on the rather larger amounts of capital raised since nationalisation. The electricity boards, and to a lesser extent the gas boards, earn something above their costs to finance expansion, but not even then on the scale which is normal practice in private industries. The National Coal Board has accumulated a deficit by not increasing coal prices sufficiently to meet the increasing costs of production. The British railways have been in chronic deficit which it was the object of the Beeching Report to reduce.

The nationalised industries are voracious users of capital, as they are nearly all highly capitalised industries. Until 1956 they raised new capital, when they wanted it, by floating an issue on the Stock Exchange, the issue being guaranteed by the Government. Since then the nationalised industries have drawn directly on the Exchequer for their capital. This system has been attacked on both sides. The advocates of private enterprise have pointed to the strain this puts on the Exchequer, and to the unfairness whereby the nationalised industries get their capital cheaper or more easily than private industry. From the other side, it has been pointed out that the nationalised industries have suffered from their dependence on the Exchequer. In times of balance of payments crises the nationalised industries have been forced by the Government to cut back their planned programmes, sometimes at serious cost in disorganisation.

3. INCOMES, WAGES, AND PRICES

Personal Income, Spending, and Saving.

National income is a measure of the total income accruing to residents in return for services rendered. It therefore consists of the sum of wages, salaries, profits, and rents. Not all this income accrues to persons. Thus, companies do not distribute all their profits to shareholders: in 1965 undistributed profits amounted to £4,040 million. This is part of national income but not of personal income. On the other hand, some personal incomes are not payments for services rendered. Such incomes are called "transfer incomes" to emphasise that their payment does not add to the national income, but only transfers income from one recipient to another. Included in this category are retirement pensions, children's allowances, National Assistance payments, etc., amounting in 1965 to £2,724 million; and the interest on the National Debt paid out to persons. Total personal income in 1965 was £29,736 million.

The table shows what happened to this income. Direct taxation—income tax and surtax—took about 11 per cent of total personal income, and National Insurance contributions, which being compulsory are in effect a form of tax took a further 6 per cent. The remainder of personal income—called disposable income—was available for spending or saving. In 1965 total personal savings amounted to 6 per cent of personal income and 8 per cent of personal disposable income.

The other 92 per cent of disposable income was spent on consumption goods and services. Consumption expenditure in turn was broken down in the following way: a quarter on food; an eighth on drink and tobacco; 16 per cent on housing, fuel, and light; 9 per cent on clothing; 8 per cent on durable goods (motor cars, television sets, refrigerators, etc.); 7 per cent on travel; leaving just over a fifth for other goods and services. Almost as much was spent on drink and tobacco as on housing, fuel, and light. This is partly because drink and tobacco is subject to heavy indirect taxation, which is the name given to taxes which are levied on particular goods and services. Thus nearly three-quarters of expenditure on tobacco goes to the Government. Total indirect taxation on consumers' expenditure amounted to £4,196 million in 1965, though this was offset by subsidies—payments by the Government towards the cost of particular goods and services, mainly some foods and housing—amounting to £508 million.

DISPOSAL OF PERSONAL INCOME, 1965.

	£ million.	Percentage.
Total Personal Income	29,700	100
less:		
Direct Taxes	3,390	11
National Insurance contributions	1,690	
gives:		
Disposable Income	24,620	83
Available for:		
Consumption	22,710	77
Saving	1,910	

Types of Personal Income.

Compare the sources of personal income in 1938 and in 1963. We see in the table that income from employment increased considerably, largely owing to a rise in the salary bill. The reason is not that salaries have increased faster than wages, but rather that the number of salaried workers has increased much faster than the number of wage-earners. There has also been an increase in the proportion of incomes derived from public grants—old age pensions, war pensions, sickness benefits, student grants, etc.

SOURCES OF PERSONAL INCOME, 1938 AND 1963.
(As percentage of total)

	1938.	1963.
Income from employment	*59·5*	*71*
of which:		
wages	38	39
salaries	18	25
Forces' pay	1·5	1·5
employers' contributions*	2·5	5·5
Income from self-employment	*12·5*	*9*
of which:		
professional persons	2	1·5
farmers	1·5	2
others	9	5
Income from property	*22·5*	*11·5*
Grants from public authorities	*5·5*	*8·5*
Total	100	100

* To National Insurance and other superannuation schemes.

The types of income which have fallen as a proportion of the total are incomes of self-employed persons and incomes from property. During the war and for several years afterwards property incomes changed little—the effects of rent control, excess profits tax, and low interest rates were such that these incomes did not rise, while other incomes increased sharply. In more recent years there was a rise, as rent control on some property was lifted and as interest rates increased; but nevertheless the share of property incomes in 1963 was only about half of what it had been in 1938. Over this quarter of a century

there was a fundamental redistribution of income away from property-owners towards employees.

Incomes by Size.

In 1964 over 70 per cent of income-receivers had incomes under £1,000 and over 90 per cent under £1,500. The remaining 9 per cent with incomes over £1,500 received 27 per cent of the total income, and the top 1 per cent received 8 per cent of the total. Thus Britain is far from being an egalitarian society; income is still very unevenly distributed, but not so unevenly as before the war, when the top 1 per cent received 16 per cent of total income.

Taxes on income are of course highly progressive, rising sharply as income increases. Those with low incomes pay no income tax, and in so far as they are pensioners, no compulsory contributions either. We see from the table that the proportion of income paid in direct taxes rises from 2 per cent in the income bracket £250–£500 to 9 per cent in the bracket £1,000–£1,500 to 46 per cent for incomes exceeding £5,000 per annum.

This tax burden somewhat changes the distribution of incomes. After tax the top 9 per cent received only 23 per cent, and the top 1 per cent only 5·5 per cent of total incomes. But the redistributive effect of taxation must not be overstressed; the levelling-up of incomes before tax has been very much more important in making Britain rather more egalitarian than has been any taxation policy.

BRITISH INCOMES BY SIZE, 1964

Range of incomes before tax.	As percentage of total. Number of incomes.	Incomes before tax.	Incomes after tax.	Rates of tax as percentage.
£50–£250	14	3	4	0
£250–£500	22	10	11	2

£1,000–£1,500	20	29	30	9
£1,500–£2,000	5	11	10	14
£2,000–£3,000	2	6	5	20
£3,000–£5,000	1	4	3	27
£5,000–	0·5	6	4	46
Total	27.5m.	£22,885 m.	£20,268 m.	11

Income and Spending Power.

In many ways figures for incomes alone substantially over-estimate the degree of equality found in Britain. First, incomes are incomes as defined for income-tax purposes. Any allowed expenses are excluded; and for the self-employed and the higher ranks of management the expense allowance now adds substantially to spending power. As tax rates have risen, it has become increasingly profitable for such classes to claim every expense to which they are conceivably entitled. Particularly important are cars required for business and also used for pleasure.

Second, only in 1965 did capital gains become taxable. If one buys an asset which then rises in value, one has clearly gained extra spending power. Not only have people in Britain been exempt from tax on capital gains, a considerable advantage in periods of boom in ordinary share prices, but also they have been able by a number of devices to convert income into capital gains, and thus avoid paying income tax. Before 1965 various Chancellors of the Exchequer merely tried to close loopholes by making illegal various transactions aimed at tax avoidance.

DISTRIBUTION OF WEALTH: VALUE OF ESTATES FOR DEATH DUTIES, 1964/5.

Size of estate. £,000.	As percentage of total. Number of estates.	Value of estates.
–1	38	3
1–2	17	5
2–3	11	5
3–5	13	10
5–10	11	14
10–25	6	19
25–50	2	15
50–100	1	13
100–	0·4	16
Total	295,798	£1,531 m.

Distribution of Capital.

Spending power depends not only on income and capital gains but also on the sheer amount of capital owned; and in respect of capital Britain is still far from egalitarian. The only figures are those that arise in connection with the payment of death duties. In 1964/5 those who at death left estates of more than £5,000—just over a fifth of the total numbers dying—owned 77 per cent of the total, and the richest 1 per cent owned 24 per cent of the total. And this in spite of a growing tendency for the rich to pass on their money before death to avoid death duties. Compared with 1938, the main change appears to be that the fairly rich are more numerous and the extremely rich are somewhat less numerous. The vast majority still own very little, and Britain is far from being a property-owning democracy.

Wages and Salaries.

In 1965 two thirds of personal income was paid in the form either of wages, salaries, or Forces' pay. The distinction between the first two is very much a matter of convention; many salary-earners now earn less than wage earners, and the main division is between those salary-earners who are paid monthly and the rest. This we see in the table. Even though weekly-paid staff do not now earn more than wage-earners, they may

WAGE AND SALARY LEVELS IN MANUFACTURING INDUSTRY.
(Earnings per week, October 1965.)

	Administrative, Clerical, and Technical Staff. Monthly paid.	Weekly paid.	Wage earners. (Adults only.)
Men	£30 3s.	£19 9s.	£20 3s.
Women	£12 17s.	£9 10s.	£9 12s.

still in effect be better off: for they generally work shorter hours; are more likely to be covered by private superannuation schemes; and usually work in better conditions.

No regular statistics are collected about salary levels; but every half-year the Ministry of Labour publishes detailed figures of the actual earnings in one week of wage-earners in a wide range of industries. There is a considerable variation in earnings between industries. Manufacturing industries pay well; and within manufacturing industries, vehicles and paper, printing and publishing pay the highest weekly wages. Public administration (including local government roadmen and the like) is a low-wage sector, particularly for men. For women the best paying industry is the buses where there is equal pay for male and female conductors. It should be borne in mind, however, that the average earnings for an industry may disguise a wide dispersion of earnings among firms of the industry and also within firms.

AVERAGE WEEKLY EARNINGS OF MANUAL WORKERS IN CERTAIN INDUSTRIES.
(April 1966.)

*All industries** .	*£20 5s.*	*£9 19s.*

* Including industries not listed.

Differentials.

Women earn on average much less than men, and juveniles usually much less than adults. Before the war the gap was relatively greater. Men, for instance, earned 5·6 times as much in October 1965 as they did in October 1938; but for women the ratio was 6·2 times. Nearly all this narrowing occurred during the war, when it was the common practice for wage advances to take the form of a flat-rate increase to all employees regardless of sex. Since 1950 the practice has altered. The usual thing has been to grant roughly similar percentage increases to all grades, and there has in fact been a slight widening of the gap.

The same narrowing occurred in other differentials. Skilled workers, for instance, were during the war granted the same flat-rate advances as unskilled and there was then and, to some extent, also in the years immediately after the war, a sharp narrowing of the reward for skill in many industries. As for the sex differential, the narrowing has now come to a halt; but it has not been reversed, and wages within the working-class are much less widely spread than they used to be. Some would say the rewards for skill were insufficient; but, on the other hand, the upgrading of the lowest-paid has, together with the reduction in long-term unemployment, been the main means by which the grinding poverty of the worst-off members of society—with all its undesirable consequences, such as malnutrition of children—has been eliminated. Today the really numerous poor are the old, the sick, and the handicapped—and not, as before the war, families with a working head who was earning too little to make ends meet.

Differentials have been a major source of industrial strife in some industries. In engineering there has been continued conflict between unions with membership largely among the skilled and those with membership largely among the semi-skilled over what form demands for wage increases should take. On the railways the strife has been even more open.

Overtime and Short-time.

The earnings of any individual worker depend on many factors, and are usually far above the minimum wage-rates payable for a week. They include overtime earnings; and overtime working is common for men. In most weeks 1·5 to 2 million workers in manufacturing will be working overtime to the extent of 8 to 9 hours. So the average-week in April 1966 was 45 hours, which is at least 4 hours above the average standard working week without overtime. In the cement industry the average working-week for men was as much as 55 hours. Indeed the average working-week in 1960 was higher than before the war, even though the standard working-week had been reduced. In most industries it was cut by 4 hours soon after the war from 48 to 44 hours, a 42-hour week was introduced between 1960 and 1962, and there was a movement towards a 40-hour standard working-week between 1964 and 1966.

Short-time, the working of less than the standard week, has not been common since the war. It has been important in particular industries at particular times; but even in February 1963, at the bottom of the recession, it was far smaller than overtime. Then 165,000 workers were on an average short-time of 12·5 hours—a total of 2·0 million hours lost, as against 12·3 million hours of overtime in the same week.

Earnings and Rates.

Overtime is not, however, the main reason why earnings exceed minimum wage-rates; for most workers earn very much more than the minimum in the standard working-week. One reason is payment by results, the system of payment under which the worker's wage depends partly on output. The commonest form is still the piecework system, under which pieceworkers are paid a fixed low rate per hour for each hour worked plus a fixed piecework price for each operation performed; but increasingly employers tend to prefer as a more effective incentive some scheme under which the bonus payment is related to the output of a larger group or to that of a whole factory. With payment by results systems—these cover about 40 per cent of the workers in manufacturing industry—earnings rise as productivity rises, and, as usually such workers also participate in advances in wage-rates negotiated between employers and unions, the gap between earnings and wage-rates tends to widen for them. So workers not paid by results press for similar advances for themselves, and in times of booming trade get them under a wide variety of names and forms—merit payments, lieu rates, compensation bonuses, etc.

Between 1955 and 1965 wage-rates rose by 51 per cent and earnings by 75 per cent. The advance in rates was little more than the rise in retail prices—only 15 per cent—so that anyone who actually earned the minimum rate throughout was not much better off. But earnings rose by 40 per cent more than prices, so that the main source of the extra real income of the working-class is to be found in the widening gap between earnings and rates.

Wage Negotiation.

In Britain there were 10·1 million trade union members in 590 unions in 1964. Most of these unions are very small, over 500 having less than 2,500 members, but 18 have a membership of over 100,000. The main job of unions is collective bargaining with employers, and in most industries most employers also belong to associations which bargain collectively on their behalf. Some big firms, however, prefer to remain outside the associations, and strike their own bargain with the unions. Before the war many firms tried to encourage the formation of Company Unions, *i.e.*, of unions confined to employees of a single firm; but this is now uncommon. In some lowly paid trades—catering, baking, dressmaking, and others—minimum wages are fixed by Wages Boards or Councils set up by the Ministry of Labour; and representatives of the workers and employers, and independent members, meet together to reach agreement on the settlement to be recommended to the Minister. But over most of industry the aim of collective bargaining is to reach voluntary agreement, and the Ministry of Labour intervenes

only when no agreement is reached. Even in the nationalised industries, the Government does not usually intervene unless negotiations between the Boards and the unions break down.

The usual pattern of negotiation is like this. First, the union puts in a claim for an all-round increase, usually much larger than it expects to get. Then after a time the employers reply, often offering a much smaller increase, and sometimes none at all. They then argue round a table until either they reach agreement or they definitely fail to reach agreement. If the latter happens the next step varies considerably from industry to industry. Many industries have their own "conciliation" machinery, in which outsiders try to help the two sides to reach agreement. Some, though not many, also have their own "arbitration" machinery, in which outsiders can recommend a solution of the dispute, which is sometimes binding and sometimes not. It depends on what the two sides have agreed on in advance. Many industries have no machinery of their own and depend on the general facilities the Minister of Labour can offer. He may appoint an impartial conciliator; or he may, with the agreement of both parties, refer the matter to the Industrial Court, which arbitrates between the parties; or he may set up a Court of Enquiry which enquires into the dispute and makes recommendations, which are not binding on the parties; or he may decide to do nothing at all, if he judges intervention to be useless. Nor need either unions or employers call him in; the former may opt to put pressure on the employers immediately either by strike action, or by banning overtime or piece-work, or by other action.

Thus the British Government traditionally has little power to control wages directly or to impose agreements. The recent attempts to introduce compulsion in wage-determination are described in Part III.

Important Negotiations.

A few negotiations are particularly important in determining how wages rise in a year; for the pattern of later settlements tends roughly to follow those of earlier settlements. Probably the most important of all are those between the Confederation of Engineering and Shipbuilding Unions—an organisation representing 3 million workers—and the Engineering Employers' Federation, as this single negotiation directly affects the wages of 3½ million workers, and indirectly many more. On several occasions since the war negotiations between these two have broken down, and only finally been settled after a Court of Enquiry had recommended a compromise wage-advance. The Confederation is a special negotiating body comprising all the unions who have members working in the engineering and shipbuilding industries. These include many small, skilled workers' unions, such as the Patternmakers' Union, but they also include, besides the 1 million-strong Amalgamated Engineering Union, the two large general unions, the Transport and General Workers' Union, with about 1¼ million members, and the General and Municipal Workers' Union, with not far short of a million. These last two represent the semi-skilled and unskilled workers, and conflict between them and the skilled unions concerning differentials is common.

The other really important negotiation is that between the British Transport Commission and the three railway unions—the large National Union of Railwaymen, representing most grades, the Amalgamated Society of Locomotive Engineers and Firemen, representing the drivers and the firemen, and the Transport Salaried Staffs' Association, representing the ticket collectors, railway clerks, etc. The importance of this negotiation lies in the fact that railwaymen are comparatively badly paid; but, as the Transport Commission runs a deficit, any wage advance has effectively to be paid for by the Government. Time and time again—for example the rise in early 1960 arising out of the Guillebaud Report on railway pay—wage advances have been given to railwaymen with the purpose of trying to narrow the gap between them and other workers; but the advance given to railwaymen then acts as a guide to other settlements, so that the railwaymen remain relatively as badly paid as before.

The strike is the unions' weapon of last resort. Most unions maintain strike funds in order to support their members when they call them out on strike; but these funds are small, and strike pay is usually very much below normal wages. So unions cannot afford to call strikes irresponsibly, and major official strikes are uncommon. In most years there will be one or two, but not more, and the total number of working-days lost is usually negligible—less than one day per head. Even in the industry affected the lost working-days are usually made up in the following weeks by overtime.

Nevertheless, the big strikes are important; for the success or failure of one big strike can affect the results of all the other collective bargaining under way at the time. They can also affect the awards of arbitration tribunals since, in the main, arbitration awards tend to follow the pattern of settlements already made in other industries. There is no purpose in a tribunal trying to be fair if it cannot get its awards accepted. So the settlement reached as a result of a strike often determines the amount by which wage-rates will rise on average over all industries.

Most strikes are neither large nor official, nor about wages. An official strike is one called by a union, usually by decision of the national executive, and is usually the result of a breakdown in collective bargaining about wages. But unofficial strikes called by local leaders with the authorisation of unions are usually about other matters. None of the big unofficial strikes which have plagued the London Docks since the war was about wages, but usually about some relative triviality that only bore witness to the thoroughly poor state of labour relations in that industry. Much the same may be said about the continual strikes in shipbuilding, many of them caused by demarcation disputes concerning which jobs should be done by which type of skilled worker. These sort of strikes are really a form of industrial protest, and the employers have to bear their share of the blame.

In 1965 there were in all 2,350 strikes in the United Kingdom; 869,000 workers were directly or indirectly involved, and 2,932,000 working days were lost. This means that the average strike involved about 370 workers and lasted over 3 days.

In most industries there are very few strikes. The main strike-prone industries, apart from the mines, are vehicles, shipbuilding, and docks; but even in these the extent of strikes must not be exaggerated. In shipbuilding with the worst record of disputes, losses are only just over one day a year and, if that were all, could safely be ignored. But, of course, strikes are also a symptom of industrial trouble; and it is no accident that in shipbuilding productivity has scarcely improved at all since the war.

Prices and Real Incomes.

The aim of a trade union is to get for its members a higher standard of living, and its success depends on the extent to which wage advances exceed the rise in the cost-of-living. Prices rose very rapidly

WAGES AND PRICES.
(1955 = 100.)

	Weekly wage-rates.	Weekly earnings.	Index of retail prices.	Real wage-rates.	Real earnings.
1950	73	68	77	96	91
1955	100	100	100	100	100
1960	124	126	114	110	112
*1965	151	163	136	115	127

(by over 30 per cent) between 1949 and 1953, and earnings only just kept ahead in this period. But since then *real earnings* (*i.e.*, command over goods and services of money earnings) have risen steadily. Thus, between 1955 and 1965, the real earnings of a wage-earner rose by 27 per cent.

Real incomes of pensioners and those on National Assistance have gone up too, after the serious erosion of their value in the late 1940s. The retirement pension is still inadequate for a decent life; but that is because when the National Insurance scheme was set up in 1948 it was believed that the nation could not afford anything better, and not because inflation has eroded the value of the pension. Inflation can no longer be deplored on the main ground that it leads to much hardship. The main danger is that British exports become uncompetitive, and that the balance of payments position deteriorates and puts a brake on the growth of the economy.

Price Changes.

In the calculation or real wages it is usual to make use of the *index of retail prices*, commonly called the cost-of-living index. This index is calculated monthly by the Ministry of Labour, and in a few industries with sliding-scale agreements, wages are adjusted to take account of the index. In other industries the index has naturally had an influence on the course of negotiations. Indeed, up to 1958 it was probably the dominant influence. In no year before then had the annual rise in prices been less than 2 per cent. In 1951. Since then, however, the dominant trend of import prices has been downwards, and changes in prices of imports cannot be directly blamed for the continuing rise in prices since 1951. The source has to be looked for in the tendency of wages, salaries, profits, and other incomes to rise faster than real output, and this they have done in almost every year since the war.

Wages and Prices.

Wage increases are probably the most important. When a trade union negotiates a wage advance for all or most of the employees in an industry, firms will immediately consider whether they should increase their prices to cover their increased wage-costs. As it is common practice for firms to fix the selling prices of their products by first calculating the direct cost of labour and of materials, and then adding on a percentage to cover overhead costs and profits, they will tend to want to raise their prices not only to cover the cost of the wage advance but also to cover their percentage addition. Moreover, in deciding whether or not their customers will stand for such increases, firms will be influenced by the knowledge that their competitors have to pay the

INDEX OF RETAIL PRICES.
(January 1956 = 100.)

	1965 Weight.*	Monthly average index.			
		1950.	1955.	1960.	1965.
Food	311	65	98	107	124
Drink	65	}94	100	98	127
Tobacco	76		98	112	146
Housing	109	83	98	132	169
Fuel and light	65	65	92	117	150
Durable household goods	59	80	94	98	107
Clothing and footwear	92	83	98	104	114
Transport and vehicles	105	—	—	118	135
Services	63	73	97	115	147
Other goods	55	77	96	120	140
All items	*1000*	*74*	*97*	*111*	*132*

* *I.e.*, proportionate importance of item in total expenditure in 1965.

Price changes have not been the same for all types of goods. For instance, between 1956 and 1965, when the total index rose by 32 per cent, housing went up by 69 per cent and fuel and light by 50 per cent; but the prices of food, clothing, drink, and especially durable household goods rose less than the average. Since rent, fuel, and food form a much higher proportion of total expenditure for the poor, and particularly for pensioners, than for most households, it is possible that prices rose more for the poor than for the rich over these years.

The Causes of Price Inflation.

Prices charged in the shops are determined by a great many factors, over many of which the Government has little or no control. First among these is the price of imports. Prices of imported food and raw materials are determined in the world markets, in which Britain is only one of many purchasers. In the raw material markets the U.S.A. is usually the dominant purchaser, and prices depend greatly on the level of economic activity there. In the food markets British purchases are much more important, since the U.S.A. grows most of its own food, and is a large exporter of some foods. Prices in raw material markets are continually changing, and can fluctuate wildly. For instance, the average price of copper rose 40 per cent between 1954 and 1955, and then fell back in 1957 to 10 per cent below its 1954 level. Fluctuations at the time of the Korean War were even more fantastic. The price of wool rose over four times, and then came down just as abruptly to only a quarter above its earlier level; the price of rubber behaved similarly. The large rise in import prices, coming on top of the rise that had been brought about by devaluation, caused the cost-of-living index to shoot up sharply

increased wages too, and will probably therefore be raising their prices. So industry-wide wage advances—and changes in costs of materials—are particularly likely to be passed on to the consumer; and, as wage-earners are also consumers, to generate further demands for wage advances to cover the increased prices. Profits per unit also go up under this tendency to set prices on a *cost-plus* basis; but it is the wage advance which tends to set the spiral off, by providing the opportunity for price increases.

Once this spiral gets going, it is very hard to stop it. In general, the requirement is that wage earnings should not rise faster than productivity (output per man). But, as in some industries productivity is very slow to rise, and as it would be unfair and impracticable to exclude their workers from participating in any general rise in the standard of living, this requirement means that in industries with a rapid growth of productivity wage advances should be kept well below the rate of rise of productivity. For two reasons this is rather difficult. First, rising productivity often raises the wages of some workers in these industries automatically, because they are paid by results or through some incentive scheme. The rise of wages from this source takes the form of a tendency on the part of earnings in these industries to rise faster than wage-rates; but that does not mean that all employees benefit, or that there is any likelihood that the unions in these industries will not press for the same rate of increase in wage-rates as is achieved in the slowly-growing industries. Second, employers in the rapidly-growing industries have far less reason to resist demands for wage increases than those in slowly-growing industries. Indeed, they are quite likely to bid up wages in order to get the labour they need, rather than to try to hold down wages.

There are therefore major problems in prevent-

ing a faster rise in wages than in productivity, with its consequence of rising prices. And once a wage-price spiral has started, the problems become more acute because unions and employers become accustomed to substantial annual advances in money wages. A main source of continuing price inflation has been the tendency of money wages to continue to advance at a rate that was appropriate when the cost-of-living was going up sharply, but ceased to be appropriate in later years.

The Stopping of Price Inflation.

There are several possible methods of attack on the inflationary spiral of wages and prices. Perhaps the most fundamental, and certainly the most helpful to other objectives of economic policy, is to achieve a faster rate of productivity growth. The faster the growth of average productivity, the faster can average incomes rise without an increase in average prices. But if wages and other incomes rise more rapidly than productivity, it will be difficult to maintain price stability.

Comprehensive and detailed Government control of wages must probably be ruled out for political and institutional reasons, and so must comprehensive and detailed control of prices. Either would involve a much more "controlled" economy than we have at present, and experience suggests that such detailed control would involve a major loss of flexibility in the economy. At the other extreme, general exhortations to unions to exercise restraint on wages, and to manufacturers to exercise restraint on prices, have probably had little effect.

Various intermediate lines of approach have been or could be tried. In 1948–50, the Government secured the co-operation of the T.U.C. in the wages "freeze". For a time this was successful, but the increases in prices which followed the devaluation in 1949 made substantial increases in wages unavoidable, and the freeze was abandoned. By setting an example in the nationalised industries over which it has a more direct influence, the Government can encourage employers to take a tougher attitude towards wage claims. This was one strand of policy in the later 1950s. Its disadvantage is the obvious unfairness of a policy which is most likely to be effective in nationalised industries, many of whose workers are relatively badly-paid. Another approach is to lower tariffs or remove quotas on imports, thus exposing some manufacturers at home to tougher competition from abroad. Manufacturers would be less able to raise prices without losing markets, and unions would be less willing to press wage claims if there was a real danger that some of their members would lose their jobs as a consequence. But the gains from a policy which depends for its success on higher imports have to be weighed against its effects on the balance of payments. Or again, many prices in the economy are directly influenced by Government indirect taxation which raises the price of some goods, and Government subsidies which lower the prices of other goods. By manipulating its tax and subsidy policies, the Government can exercise a powerful influence on the price level: though of course any reduction in indirect taxation or increase in subsidies would probably have to be financed by increases in direct taxation, which may in turn have undesirable effects on incentives to harder work and greater effort.

More indirectly, the Government can attempt to control the wage-price spiral by controlling purchasing power through its monetary and fiscal policies. If purchasing power is curbed, manufacturers find it more difficult to raise prices, and the bargaining power of unions may be reduced. In the 1950s, the Government relied heavily on fiscal and more especially monetary policies, the nature of which will be examined in later sections. The main danger is that curbing purchasing power is likely to curb the rise in output and productivity, so that attempts to control the wage-price spiral in this way could result in the stagnation of the economy. Furthermore, there is a danger that some wage increases will continue in periods of stagnation so that inflation cannot be entirely avoided.

It is clear that there is no easy solution—there are difficulties and disadvantages attaching to every possible measure for controlling price inflation. In Part III we shall discuss the solutions which have been attempted in the 1960s.

4. MONEY, BANKING, AND FINANCE.

The Radcliffe Report.

In September 1957 the Chancellor set up the Radcliffe Committee to report on the working of Britain's monetary institutions. The report of the committee, published in 1959, contains a detailed description of the monetary institutions of this country, and a systematic appraisal of monetary policies in the 1950s. It is complicated, because the monetary system is complicated; but it is written in terms which can be understood by the layman. Any reader who finds the following account inadequate should consult it.

Money.

In Britain money consists of bank-notes, coinage, and banks' debt. Bank-notes—mainly in denominations of £5, £1, and 10*s*.—are issued by the Bank of England, which has been publicly owned since 1946, and which acts in effect as an agent of the Government. We shall see below (G23(1)) how commercial banks can also create money.

The total size of the bank-note issue is not a good guide to the amount of purchasing power in the economy. The Bank of England stated in its evidence to the Radcliffe Committee that it was now its policy to issue bank-notes in accordance with the convenience of the public, and not to use this means of controlling the amount of purchasing power. As a result, the various checks on the size of the note issue—in particular the Parliamentary control over the fiduciary issue, *i.e.*, the permitted maximum level of the note issue—have become functionless and may be ignored. An increase in the value of the note issue is now only a symptom and not a cause of inflation.

Determination of Income and Employment.

What matters is the amount of purchasing power available to the public. Most private expenditure is financed out of income—after paying taxes—and most government expenditure out of taxes; but most investment, public and private, and a growing amount of purchases of durable goods by consumers, is not financed out of income, but out of borrowing of one kind or another. And the primary purpose of monetary policy must be to keep the total of this kind of expenditure out of credit in line with the amount of savings private individuals and profit-making companies are prepared to make out of their incomes. For if such investment expenditure exceeds the amount which the community wishes to save out of its current level of income, it means that the total demand for goods and services exceeds total current output. If output cannot be increased because men and machines are already fully-employed, prices and wages and also imports are forced up in response to the demand. If, on the other hand, investment expenditure falls short of saving out of full-employment income, production and employment are reduced below the full-employment level.

There is no automatic mechanism in our economic system which ensures full-employment of resources, and it is the task of Government to balance savings and investment at the right level of employment. This important fact was first established by the great economist J. M. (later Lord) Keynes. Prior to the Great Depression, economists believed that any divergence from full-employment was a temporary phenomenon, which would right itself. However, in the 1930s Keynes produced a new explanation of how income and employment are determined; and so brought about what has come to be known as the *Keynesian Revolution* in economics.

Government Control of Income and Employment.

The Government can control the level of income and employment in various ways. First, in many fields the Government has only very restricted powers to influence behaviour. It

cannot compel persons or companies to save; it can only offer them inducements to do so in the form of higher interest rates or of tax concessions on receipts from interest, and their effectiveness is limited. Nor in general has it very much direct power over expenditure out of credit. It can and does control the conditions under which hire-purchase agreements are made—and this does, temporarily at any rate, make a great deal of difference to the amount of goods bought on hire-purchase. It can to a certain extent influence private companies in their investment policies by granting and withdrawing incentives to investment (see G15(1)); but it is doubtful quite how much influence these changes have. And it can, if it chooses, exercise direct control over building, by allowing building only on licence. This power, however, is not now used in order to control the level of investment, but only in order to encourage it in depressed areas and discourage it elsewhere. The only authorities over whose investment the Government does have real control are the nationalised industries; and, as the Radcliffe Committee pointed out, there are obvious disadvantages in any system whereby investment in public utilities is determined, not by the need for such investment, but by the need to balance savings and investment.

The two main means remaining are fiscal and monetary control. If the Government thinks there is going to be a shortage of private savings it raises more in taxation or reduces its current expenditure and so increases the Budget surplus (see G26(2)). The second form of control is much more complex; in principle, the aims are twofold. One is to keep the amount of credit-creation down (or up) to the required extent; the second is to ensure that the Government gets the share of savings it needs to cover its investment programmes. The complexity arises from the inter-relations between these two tasks.

The Government as Borrower.

The Government is a heavy borrower from the rest of the economy. In 1965 total public borrowing—by government, nationalised industries, and local authorities—stood at £38,000 million, equivalent to 1·4 times the annual national income. Most of this immense National Debt was built up during the war, when government expenditure far exceeded taxation; but the total continues to advance year by year, owing to the heavy capital requirements of the nationalised industries.

The Government borrows in six main ways. First, the issue of bank-notes is in effect a form of government borrowing. Second, it borrows from foreign governments. Third, it borrows from companies through tax reserve certificates, which are a means by which companies let the Government have the taxes they would have to pay on profits as the latter are earned, rather than when the taxes legally become due. Fourth, it borrows direct from private individuals through the various forms of national savings. In all forms of national savings the Government pays interest—or in the case of premium bonds prizes in *lieu* of interest to the winners of the monthly draw—to the holders, who have the right either on demand or at short notice to the repayment of their loans.

Gilt-edged Securities and Treasury Bills.

The fifth and sixth methods of borrowing are through the market. The main method is through the Stock Exchange by the issue of fixed-interest securities, called *gilt-edged securities*. In 1965 the net amount owing to the public on all such securities was nearly £13,000 million—a third of total public debt. Most gilt-edged securities are promises to repay at a specified date in the future the amount originally borrowed; and in the meantime to pay a fixed amount of interest each half-year. Some gilt-edged securities are irredeemable, and consist therefore simply of a promise to pay the interest in perpetuity.

Most gilt-edged securities are held by institutions: the banks, discount houses, and other major financial institutions of the country, and foreign governments (whose holdings represent their sterling balances, (*see* G7(2)); only a fifth of the total being held by private individuals. Gilt-edged securities, unlike national savings, are not liquid assets. Until they become due for replacement they can only be sold on the Stock Exchange for what they will fetch, and variations in their market value are quite considerable. Dealings in second-hand securities can have important effects on the economy. Variation in the market price of securities implies an inverse variation in the effective rate of interest which they earn. This in turn can influence the general level of interest rates, hence the amount of investment which it is profitable to carry out, and hence the general level of economic activity.

The sixth form of borrowing is by means of *Treasury Bills*, of which £2,100 million were outstanding in 1965. A Treasury Bill is an extremely short-term loan to the Government—usually for three months. Each week the Treasury offers for sale some £300 million of these, and a number of specialised institutions bid for them. The difference between their bids and the value of these bonds on repayment is called discount, and is a substitute for interest. These bills play a crucial role in the monetary system, for it is by affecting the rate of discount on Treasury Bills that Bank Rate influences monetary conditions in the economy; but more of that a little later.

Government Borrowing and Liquidity

Monetary policy consists largely in varying the way in which the Government borrows to finance its expenditure. This is because the form of borrowing affects the amount of *liquidity* in the economy. All financial institutions have some policy regarding liquidity. In general they try to maintain sufficient reserves either of cash or of assets which can be immediately converted into cash to meet any foreseeable sudden increase in their commitments. But they do not hold all their assets in liquid form. The chance that all their creditors simultaneously demand their money back can be ruled out, and therefore most of them act on the principle that they should maintain cash or other liquid assets to cover some percentage of their total outstanding commitments. Whereas currency and Treasury Bills are regarded as liquid assets, government securities and most other forms of government borrowing are illiquid.

If therefore the Government borrows more by issuing currency or Treasury Bills and less by other means, this action increases the amount of liquid assets about and therefore the total lending which financial institutions think it safe to make. And, conversely, if the Government borrows less by issuing currency or Treasury Bills and more by other means, this tends to decrease the total amount of loans which financial institutions are prepared to make. However, government control over the way in which it borrows is circumscribed. The public can be persuaded to hold more government securities only if the rate of interest earned on securities is increased. In the 1950s the British Government was unable to prevent a rapid accumulation of short-term debt, even though it allowed the rate of interest earned by irredeemable government securities to rise from less than 4 per cent in 1950 to over 5 per cent in 1960.

The Commercial Banks.

In the centre of the financial world stand the commercial banks. In England these are known as the London clearing banks. In this country, unlike the United States, the banking system is highly concentrated; there being five main banks with branches in every town. The commercial banks are important because their debts are used by the public as money. Anyone who has a bank current account can sign cheques or withdraw cash on demand up the the limit of his account. Because they can be used as a means of payment just as readily as bank-notes, bank deposits are money.

Commercial banks earn a profit by borrowing funds and then lending part of these funds at higher rates of interest. Because it is unlikely that all deposits will be withdrawn at once, the banks hold only a small proportion of their deposits in the form of cash. The Bank of England requires them to hold 8 per cent; and we see in the table that in 1965 the average cash ratio was

LONDON CLEARING BANKS, 1965
(£ million.)

Liabilities.		Assets.		Percentage of deposits.
Capital and reserves	513	Cash	739	8·2
Deposits	8,989	Other liquid assets	2,042	22·5
Other.	542	"Special deposits"	56	0·6
		Investments	1,087	12·1
		Advances	4,653	51·8
		Other	1,467	
Total	10,044	Total	10,044	

8·2 per cent. In addition they hold by convention liquid assets (Treasury bills and money at call and short notice) equal to at least 30 per cent of their deposits; the ratio being 30·7 per cent in 1965. These liquid assets are easily transferable into cash. Their remaining assets are more remunerative; the majority being advances made to the public and earning a rate of interest higher than Bank Rate. In 1965 cash held by the commercial banks amounted to £739 million, whereas the public had deposits with the banks totalling £8,989 million. Thus the banking system can create money: it does so by accepting bank deposits far in excess of the cash held to meet demands for these deposits.

The Control of Commercial Banks.

The first step in any credit squeeze is to put pressure on the commercial banks by reducing their liquidity; so causing them to restrict their advances to would-be investors. This can be done in two main ways. The first is by *open-market operations*, in which the Bank deliberately sells more government stock than it otherwise would. The purchasers pay by cheque, and thus create a debt from the commercial banks to the Bank of England. Such debts have to be settled in cash, and so pressure is put on the banks' liquidity. The second is *Bank Rate*. If Bank Rate is raised it has the immediate effect of raising the rate of discount on Treasury Bills. A high rate of discount on these makes them appear attractive investments to those who do not normally buy them, and the commercial banks find it difficult to get as many of them as they would like. So again there is pressure on the banks' liquidity.

Faced by such pressure, the banks have to take steps to restore their liquidity either by selling securities or by calling in advances. Neither method brings in much cash directly; for since the banks will be paid by cheque rather than in cash, they have to go on until the depletion of deposits caused by the paying of these cheques cuts down the total of deposits to the level where liquid assets once again represent 30 per cent of the total. To this there is one major exception; if the Bank of England buys the securities the banks sell—and the need to ensure an orderly market may force it to do so—then selling securities brings more cash into the banks, and thus enables them to replenish their liquidity.

Since 1958, the monetary authorities have had the power to call upon the banks to make *special deposits* in cash with the Bank of England. Unlike other deposits of the banks with the Bank of England, special deposits cannot be treated as forming part of the liquid assets of commercial banks. This is in effect another way of putting pressure on the liquidity position of banks: the necessity of making such deposits could force them to sell securities or reduce advances. "Special deposits" amounted to 0·6 per cent of the banks' total deposits in 1965.

Bank Advances and Other Credit.

Bank advances are the simplest of all forms of credit; the customer is just given the right to sign cheques beyond his credit account, and interest is charged on the overdraft. In the late 1950s, a new form of advance—the personal loan—was introduced by some banks. These are granted to customers who would not earlier have been regarded as credit-worthy. A higher rate of interest is charged than on ordinary overdrafts, and more specific rules about repayment are laid down.

Most advances, however, are made to business, particularly to small business, and to farmers. In business the common practice is to finance working capital—stocks and work-in-progress—out of bank advances, and to depend on more permanent forms of borrowing for the purchase of fixed capital. But there are no fixed rules; business gets its finance wherever it can, and in fact there is such a variety of ways in which it can get capital that a squeeze on bank advances alone is not as effective as might be expected. Big businesses, in practice, scarcely suffer at all; for they are in the best position to tap other sources of credit. Quite a good example is provided by the hire-purchase finance companies. During the credit squeeze of 1956–58 the banks were asked by the Chancellor of the Exchequer to hold down advances, and in particular not to increase advances to hire-purchase finance companies. They did so; but the companies had no difficulty in getting the money they needed by borrowing direct from the public at high rates of interest. The real sufferers tend to be small businesses and professional people, who do find it hard to obtain credit elsewhere; but even they may be able to do so; for instance, by taking out a mortgage on their property or by buying their equipment on hire-purchase where previously they had paid cash, or by cashing some national savings.

The Radcliffe Committee discussed at length how effective a squeeze on the banks was likely to be, and in general their conclusion was that it was not likely to be very effective, because most borrowers would usually find other sources of credit. The other sources would usually be more expensive; but they thought this mattered very little, as interest payments form only a small part of most business costs, except in very highly capitalised industries, most of which are now publicly owned. Interest does matter in housing; the monthly interest payments due on a mortgage to a building society can go up substantially when the rate of interest goes up, although usually for existing, as opposed to new, mortgages no more money is asked for; instead the term of the mortgage in years is extended. But in hire-purchase, where service charges far exceed the interest element in any loan, interest is of trivial importance.

The Stock Exchange.

The banks through their advances are the main providers of short-term credit; but most long-term credit is provided through the Stock Exchange. In 1965 the total market value of all securities traded on the Stock Exchange was £75,000 million, of which £57,000 million represented stocks or shares in public companies. There are three main types. *Debenture Stock* is simply a fixed-interest loan. *Preference Stock* is a fixed-interest loan, with provisions for waiving the interest if the company fails to earn profits. Preference shareholders cannot get a company declared bankrupt if it does not pay them a dividend; but Debenture holders can. The third type—and much the most important—is *Ordinary Shares*. Nominally the owner of an Ordinary Share is a part-owner of the company concerned, with most of the rights of ownership. He has no right to any particular dividend or interest pay-

ment, but only the right to participate in net profits if there are any. In addition to stocks or shares in public companies, British Government gilt-edged securities worth £15,000 million were quoted on the Stock Exchange.

The Return on Financial Assets.

Each type of holding has obvious advantages. The fixed-interest security brings in a guaranteed income; the Ordinary Shareholder has no such guarantee, though in practice during the post-war period the risk of a decline in dividend was small. In a time of inflation the risks attached to holding fixed-interest securities are in some ways greater than those attached to holding Ordinary Shares; for, while Ordinary Shares appreciate in market value when there is inflation, fixed-interest securities tend to fall in market value, because the Government is forced to increase interest rates as an anti-inflationary measure. Furthermore, in the long run the growth of the economy tends, even without inflation, to raise the value of Ordinary Shares by increasing the value of companies. And, lastly, for investors who pay tax at heavy rates on their incomes—and most large personal investors in the Stock Exchange are rich people—capital gains are worth more than income in dividends. So for private investors, the Ordinary Share was a much better bet in the 1950s; and because Ordinary Shares were so popular, the yield on such shares—the ratio of dividends to market value—fell below the yield obtainable on Government securities (see table).

and manipulated in an attempt to control demand. This policy was adhered to by both Governments in the 1960s. We see in the table that the rate on Treasury Bills has kept in line with Bank Rate.

In addition to influencing the cost of credit by manipulating interest rates, the Government influenced the availability of certain sorts of credit through the credit-squeeze. At times it made it more difficult for the banks to extend their lending by operating on the banks' liquidity position, and it also issued more or less strongly-worded "requests" that banks should restrict growth of, or secure a reduction in, their advances.

A form of monetary control which was particularly important after 1950 was the control of hire-purchase. By increasing or lowering the proportion of the price which has to be paid as a down-payment, and by reducing or lengthening the time over which repayments can be made, the Government was able greatly to influence the volume of hire-purchase transactions, and therefore the use of this particular form of credit. These controls, of course, only affect the rather narrow class of goods—cars, furniture, washing-machines, television sets, etc.—for which a substantial proportion of sales are on hire-purchase terms. In consequence, the output of those industries concerned with the manufacture of these goods fluctuated widely.

The Effectiveness of Monetary Controls.

Running through the Radcliffe Report is a scepticism concerning the likely general effective-

PERCENTAGE YIELD ON FINANCIAL ASSETS.

1965 . .	6–7	5·9	6·4	5·5

* Range during year. † Annual average.

Most Ordinary Shares are held by private individuals; but increasingly in recent years holdings by insurance companies and pension funds have become more important, because of the growth of private superannuation schemes. Insurance companies and pension funds cannot afford to take risks, so the main bulk of their funds is still invested in fixed-interest securities; but they have shown a growing tendency to increase the proportion of their funds invested in Ordinary Shares. This switch, by lowering the demand for gilt-edged securities relative to Ordinary Shares, contributed to the downward pressure on the prices of gilt-edged securities. Legislation was introduced in 1960 to permit trusts to invest up to 50 per cent of their funds in the Ordinary Shares of large companies. In the same way, this has depressed the yield on Ordinary Shares and raised the yield on gilt-edged.

Historically, the greater security of gilt-edged holdings has normally been reflected in lower yields. If inflation is controlled, or if the prospect of industrial expansion becomes less bright, the demand for gilt-edged may increase and that for Ordinary Shares decrease; and the "normal" pattern of yields may then return.

Survey of Monetary Controls.

The post-war Labour Government pursued a *cheap money* policy. There was no major use of monetary policy as an economic regulator; Bank Rate for instance was kept at 2 per cent throughout, and the rate on Treasury Bills was only ½ per cent. Instead the Government relied on controls and on fiscal measures to keep inflation in check. For this neglect of money controls there was, in fact, a very good case: the pent-up demand for goods was so strong, and the funds available to companies and individuals so large, that monetary restrictions would not have made very much difference. The Conservative Government reintroduced monetary policy in 1951. Bank Rate was raised—reaching a peak in 1957—

ness of monetary policy, both as an anti-deflationary and an anti-inflationary weapon of control. In the former case, it is clearly difficult to encourage spending by making credit more easily available, if business prospects are so poor that no investment looks profitable. In the latter case, the Committee concluded on the use of monetary policy to counter inflation in the 1950s (para. 469):

> "The obstructions to particular channels of finance have had no effect on the pressure of total demand, but have made for much inefficiency in financial organisation."

They went on to add (para 472):

> "We are driven to the conclusion that the more conventional instruments (*e.g.*, Bank rate) have failed to keep the system in smooth balance, but that every now and again the mounting pressure of demand has in one way or another (generally *via* the exchange situation) driven the Government to take action, and that the quick results then required have been mainly concentrated on the hire-purchase front and on investment in the public sector which could be cut by administrative decision. The light engineering industries have been frustrated in their planning, and the public corporations have had almost equally disheartening experience. That these two should be the 'residuary legatees' for real resources when sharp adjustments were called for is not a comforting thought. It is far removed from the smooth and widespread adjustment sometimes claimed as the virtue of monetary action; this is no gentle hand on the steering wheel that keeps a well-driven car in its right place on the road."

However, the Radcliffe Committee did recognise that monetary measures have influenced "confidence" in sterling. A rise in interest rates increased the attractiveness of holding sterling

balances, and stern monetary measures were taken as indicative of the Government's intention to solve its problems without recourse to devaluation. In these ways, monetary policy has helped to stem speculative outflows of sterling balances which threatened to impose heavy strains on our reserves. Many commentators feel that these effects provide an important justification for the use of certain forms of monetary controls.

5. ECONOMIC ASPECTS OF THE PUBLIC SERVICES.

The Cost of Public Services.

In 1965 total public expenditure was no less than £14,055 million, about £260 per head. Of this total, the central government spent over 60 per cent, the local authorities under 30 per cent, and the nationalised industries' investment programme was responsible for 10 per cent. Total public expenditure almost doubled between 1955 and 1965; and rose as a proportion of the national income from 46 to 50 per cent.

ing expenditure consists of two quite different items. The first, housing subsidies, is a recurrent cost, and represents the difference between the cost of housing, including the cost of borrowing, and rents received on council housing. In 1965 costs exceeded the rents of £324 million by £149 million, so that the average council-house tenant was paying just under 14s. in the £ of the cost of accommodation. Up to 1957 the Government contracted to pay a flat subsidy per year on every council house built. From 1957, Government subsidies were no longer paid on ordinary new council houses, but in 1961 were reintroduced, in a form intended to encourage councils to charge higher rents on their existing houses. The Labour Government substantially increased the subsidy in 1967; it being calculated as the difference between interest payable on new housing at current interest rates and at 4 per cent.

The other part consists of the capital cost of building new houses, £628 million in 1965. This is financed out of borrowing by local authorities. In the early 1950s local authorities were able to borrow from the Government, but they have been

THE COST OF PUBLIC SERVICES.

Other expenditure	842	1,549	84	11·0
Total expenditure	7,088	14,055	98	100·0
Revenue:				
Income taxes	2,287	4,016	76	28·6
Indirect taxes	2,177	3,766	73	26·8
of which: drink	*389*	*588*	*51*	*4·4*
tobacco	*656*	*994*	*52*	*7·1*
Local rates	475	1,230	159	8·8
National Insurance and health contributions	594	1,685	184	12·0
Other revenue	1,472	2,124	44	15·1
Total revenue	7,005	12,821	83	91·2
Net borrowing	83	1,234	—	8·8
Total expenditure	7,088	14,055	98	100·0

The Government collects in revenue considerably more than it spends itself, but transfers funds to the local authorities, to the National Insurance Fund, and to the nationalised industries. The expenditure of the public sector as a whole generally exceeds its revenue, and the difference is met by net borrowing.

A breakdown of public expenditure is shown in the table. Not all categories of expenditure expanded at the same rate: expenditure on roads, transport and communication, education, external relations, and National Insurance, pensions and assistance increased faster than the total; and expenditure on defence, debt interest, child care, the agricultural subsidy, and housing fell behind the total. Nevertheless, defence expenditure accounted for 15 per cent of the total (*i.e.*, 7·5 per cent of national income) in 1965.

Public Housing.

Expenditure on public housing amounted to 6·6 per cent of public expenditure in 1965; this percentage having fallen over the decade. Hous-

increasingly forced to borrow from the market. The two policies of freezing subsidies and making borrowing more difficult have slowed down the expansion of council housing. In 1953, the peak year, councils built 245,000 houses, in 1960 only 128,000 and in 1965, 165,000. Private building has exceeded council building since 1959, and in 1965 council building represented only 40 per cent of the total.

Education.

Educational expenditure rose by no less than 185 per cent between 1955 and 1965; and accounted for just over 11 per cent of public expenditure in 1965. A small part of the increase is explained by the expansion of enrolment; total school enrolment in Britain increased by only 7 per cent over the decade. In addition, expenditure rose because the more expensive types of education—secondary schools and universities—expanded more rapidly. University enrolment increased by 60 per cent over the decade; but the enrolment of 157,000 students in 1965 still did

not meet the demand for higher education. Secondary school enrolment also shot up: pupils of school-leaving age (15 or over) as a percentage of the age-group 15–19 nearly doubled in England and Wales. Nevertheless, this proportion was only 19 per cent in 1965. Therefore it is to be expected that expenditure will continue to increase rapidly in the future.

However, quantitative expansion is not enough: there is general recognition that qualitative reform is also needed. It is important to reduce the size of classes—there were on average 29 pupils per teacher in primary schools and 18 in secondary schools in 1965, but these averages cover a wide dispersion; to raise the school-leaving age to 16—scheduled for 1970; to get rid of the gaunt Board Schools inherited from the Victorian era; and to raise teaching standards by improving the conditions for recruitment of teachers.

It is increasingly recognised that education can be an economic investment for the future just as much as capital formation in, say, machinery or roads. There is a "private return" on "investment in education", which takes the form of higher earnings over the lifetime of the person educated; and there is a "social return" on public resources devoted to education, being the greater contribution to the national product which trained and educated people can make.

Social Security.

Social security benefits come from two sources. The larger part (£1,780 million in 1965) is paid out of the National Insurance and Industrial Injury Funds. These funds are built up largely out of the compulsory weekly National Insurance contributions which most of the adult population have to pay. For employees, both employer and employee pay a contribution, in return for which employees receive rights to pensions, sickness-, unemployment-, and other benefits. The self-employed also pay contributions of smaller size than the sum of the employer's and employee's contribution, and are not entitled to unemployment and one or two other benefits. And most non-employed persons, other than married women and the retired, have to pay still lower contributions and are entitled to even fewer benefits. Weekly contributions include a contribution to the cost of the National Health Service.

The most costly benefit is the retirement pension. The pension is paid as of right on retirement. Individuals may increase their rate of pension by staying on at work after the minimum retiring age of 65 for men or 60 for women; but the number who do so for more than a year is small—partly, but probably not mainly, because most private superannuation schemes lay down a fixed retiring age. Assistance grants, on the other hand, are given only on proof of need after a test of means. The high number of supplementary grants shows that the statutory pension remained below what the National Assistance Board regards as the minimum acceptable standard, and it was partly to improve the pensions of those able to afford higher contributions that the scheme for graduated pensions was introduced.

The Finance of Social Security.

The National Insurance Scheme is an odd mixture of insurance and tax. The levels of contributions, when the scheme started in 1948, were fixed on the actuarial principle that contributions by or on behalf of an individual plus a specified State contribution should on average suffice to pay for the benefits to which he was entitled. But the scheme did not allow for inflation, and a succession of increases granted in the rate of pensions has put an end to this actuarial probity. Whenever a bill is introduced to increase pensions the Government Actuary calculates by how much contributions should be raised in order that those who contribute throughout their working lives at the new rates would just earn their right to the new benefits; but the new rates of pensions are granted to all, including those who have already retired. It was always expected that as the number of retired persons grew the fund would move into deficit; but with each rise in pensions the estimated size of the future deficit has risen. The scheme for graduated pensions also had the objective of reducing this deficit.

Graduated Pensions.

Under this scheme, which affects only employees, there are two kinds of workers—*ordinary* and *contracted-out*. In the case of the contracted-out workers, their employer (on whom the decision whether to contract out rests) must institute a private superannuation scheme that gives at least as favourable terms as the new State scheme, including the provision that rights under the scheme should be transferable up to the limits of the State scheme. Transferability is the guarantee that the individual does not lose his pension rights when he changes his job; but one unsatisfactory feature of the private schemes that have existed has been their use to tie employees to their jobs. For ordinary workers the contribution now depends on earnings. Those earning less than £9 a week pay a flat-rate contribution, which is lower than that paid by contracted-out workers. Those earning more than £9 pay in addition a percentage of the amount by which earnings exceed £9 up to a limit of £18 and in return receive the right to an increased pension on retirement.

The scheme is devised partly to encourage private superannuation, which is still largely confined to salaried employees and employees of the State. But one purpose is clear: in return for a promise of higher pensions when they retire, most workers who are contracted-in pay more now, and thus contribute now to the cost of the pensions of the retired. The estimated deficit is eliminated, and indeed the principle is established that the basic rates of contributions should not be fixed on actuarial principles but on the principle that on balance benefits paid in a year should roughly balance receipts. No provision was made for automatically increasing pensions as the cost of living goes up or indeed as the average standard-of-living rises; all changes in rates of benefit still require a new Act of Parliament.

Public Revenue.

We see from the table that, of the sources of revenue, local rates and National Insurance contributions were the most buoyant over the decade. Over 28 per cent of the total public revenue in 1965 came from income tax, which was levied both on individuals and on the undistributed profits of companies. Indirect taxes on goods and services accounted for a further 27 per cent. It is interesting to note that direct and indirect taxation actually fell as a proportion of national income between 1955 and 1965.

Two commodities in particular were heavily taxed: drink and tobacco. Together they accounted for 12 per cent of public revenue. These commodities are singled out partly for social reasons and partly because—in economists' jargon—the demand for them is *inelastic*; *i.e.*, the public reduces its consumption of drink and tobacco only slightly in response to a rise in their price. In 1965 taxation increased the price of cigarettes by 2·3 times; drink by 0·7 times; consumer durables, such as cars and washing machines, by 0·2 times; and food hardly at all. For goods and services in general, tax raised the price by roughly a quarter.

The Budget

Each year in April the Chancellor of the Exchequer announces his Budget for the coming fiscal year. The most important and most difficult task in drawing up the Budget is to decide on the size of deficit to aim for. The deficit is the excess of public expenditure over public revenue; and it has to be financed by borrowing from the private sector. A large deficit is inflationary: sometimes that may be required to get the economy out of recession. A small deficit—and even more, a surplus—is deflationary, and is a means of holding an inflation in check.

The calculation of the precise deficit or surplus needed is a chancy business; for the level that is required depends on the amount of saving and on the amount of spending out of credit that people intend to do—and this is not easily predictable. It also depends on the change in the foreign balance. Nor can the Chancellor be sure his

figures are right: estimating next year's revenue, and even next year's expenditure, by the Government is difficult enough, but he needs to estimate also the likely trends of private income and expenditure, without really reliable information as to what they were in the past year. So it cannot be expected that fiscal policy alone can prevent inflation and deflation.

Nevertheless, fiscal policy—running large deficits when economic activity is low, and small ones when it seems to be excessively high—is the most important action through which the economy can be kept on an even keel. Monetary policy may help; but the decision of the Chancellor on the size of his Budget surplus is the key one.

6. SOURCES OF STATISTICS, AND SOME SUGGESTIONS FOR FURTHER READING.

The non-specialist will find that most of the statistics he needs are given in the *Annual Abstract of Statistics*, published every year by Her Majesty's Stationery Office. This comprehensive document includes figures on population, social conditions, education, labour, production, trade and balance of payments, national income and expenditure, wages and prices, and many other topics. For more up-to-date information, reference should be made to the *Monthly Digest of Statistics* which has a similar coverage and give month-by-month figures. A selection of the more important series, presented in a manner which can more easily be understood by the layman, is given in another Stationery Office publication, *Economic Trends*, also issued monthly.

Even greater detail is given in various other Government publications. The most important of these are the Blue Book on *National Income and Expenditure*, published annually; and the *Balance of Payments* White Paper, published twice a year. Both these are extremely valuable sources of information for the economist, but are difficult for the layman. Fuller information on labour problems is given in the *Ministry of Labour Gazette*, on trade in the *Board of Trade Journal*, and on financial matters in the *Bank of England Quarterly Bulletin*. These three periodicals include discussions on the statistics presented.

For an analysis of developments in the economy the reader is recommended to the official *Economic Report*, published just before the Budget by the Treasury. It contains a survey of the economic events of the previous year. Rather more technical is the *Economic Review*, a private publication issued by the National Institute for Economic and Social Research. To explain economic events and policy the Department of Economic Affairs publishes a monthly *Progress Report*, available free of charge to the public.

For a scholarly critique of Government economic policy see J. C. R. Dow, *Management of the British Economy* 1945–60 (Cambridge University Press). An entertaining account of economic ideas and their application is found in Michael Stewart, *Keynes and After* (Penguin Books). Other Pelicans include Joan Robinson, *Economic Philosophy*, and J. Pen, *Modern Economics*. A thorough explanation of international monetary affairs is given in Fred Hirsch, *Money International* (Allen Lane). For an introduction to the problems of underdeveloped economies there is J. Bhagwati, *The Economics of Underdeveloped Countries* (World University Library).

III. DEVELOPMENTS IN THE BRITISH ECONOMY SINCE 1960.

1. INTERNATIONAL DEVELOPMENTS

The Balance of Payments.

The balance of payments has dominated events in the British economy in the 1960s. It is therefore important to analyse the balance of payments in some detail, and to understand the circumstances which led to the devaluation of the pound in 1967.

(i) The Current Account.

The deterioration in the current balance of payments of well over £400 million between 1959 and 1960 was mainly attributable to an increase of nearly £500 million in imports: exports also increased but not by enough to pay for the increased imports. The main cause was the upsurge in demand in 1959–60. During the upsurge, productive capacity at home became strained, and some goods were imported to supplement home supplies. Stocks of imported goods were run down in 1959 and replenished in 1960. And higher incomes meant higher demands for imported goods. These developments might be interpreted as indicating the adverse effects on the balance of payments of internal expansion. No

* A plus sign denotes a rise in liabilities or a fall in assets, and a minus sign a fall in liabilities or a rise in assets.

doubt imports will increase as the economy expands; but it can be argued that sudden and very rapid bursts of expansion, as in 1959–60, will have a much greater effect on imports than would a steadier and more sustained growth.

In the following two years, imports were steady at about the 1960 level: the internal economy was relatively stagnant, partly because restrictive measures had been adopted to curb demand at home and protect the balance of payments. Imports were sharply up by over £250 million in 1963 with the rapid expansion of national expenditure, but there was a slightly larger increase in the value of exports.

The surplus on invisible trade, which had exceeded £300 million in the early and middle fifties, ranged between £100 and £200 million in the early sixties (*see* G7).

(ii) Flows of Long-term Capital.

The deficit on long-term capital—representing the excess of the amounts we lend, invest and re-invest abroad over the corresponding amounts lent, invested and re-invested by foreigners in Britain—is subject to abnormal fluctuations. Thus the deficit in 1959 was unusually large because it included the British subscription to the IMF (*see* G8), and became a small surplus in 1961 owing to receipts of a special nature. Allowing for such abnormal factors, however, the capital outflow was fairly stable over the period 1959–63 at £100–200 million per annum.

(iii) Monetary Movements.

Any deficit in long-term capital transactions, together with any deficit on current account, has to be financed either by increasing our short-term liabilities to foreigners, or by reductions in our assets. In 1960, over £450 million had to be financed, but the imbalance on current *plus* capital account was very small in the following years until the crisis year of 1964. Oddly enough, the financing of the huge 1960 deficit did not raise any immediate problems, owing to a substantial inflow of short-term funds (*i.e.*, additions to our short-term liabilities). The sterling balances (*see* G8) rose by the unprecedented amount of over £400 million. This was largely due to speculation against the dollar, based on fears that it might be devalued. So great was the inflow that there was a curious combination of a very large *deficit* on current plus long-term capital account and a substantial *rise* in our reserves of gold and convertible currencies.

The dangers inherent in the financing of deficits through additions to short-term liabilities were vividly demonstrated the following year. Much of the funds which moved in during 1960 was moved out again before July 1961 in a wave of speculation against sterling. The outflow was financed partly by running down reserves of gold and convertible currencies by £280 million between end-1960 and July 1961, and partly through the Basle agreement under which European central banks undertook to build up short-term holdings in centres (London in this case) from which funds were being withdrawn. The rapid drain on the reserves had to be stopped: and the European central banks were not prepared to see their sterling holdings rise much higher. So in July 1961 a series of crisis measures—including the raising of Bank Rate to 7 per cent—were taken, primarily to protect sterling. In addition, arrangements were made to withdraw over £500 million from the IMF with provision for further credits if necessary. In 1962, speculative movements of funds were much less violent. Aided by a substantial improvement in the current balance of payments, Britain was able to complete repayments of its IMF drawing. These repayments did, however, involve a drain on the reserves; and this explains the substantial fall in the reserves over the year.

The 1964 Crisis.

Imports in 1964 were some £640 million higher than in 1963, whereas exports were up by less than £200 million. The remarkable increase in the value of imports cannot be explained simply as a rise in import prices: imports increased by 15 per cent in value and by 11 per cent in volume. Nor can it be seen merely as a response to the expansion of the economy: if imports had done no more than rise in line with output, they would have increased in volume only by about 4 per cent. Part of the explanation lies in the fact that importers were stockbuilding after the depletion of raw material stocks during the boom of 1963. More important, however, is the fact that imports of manufactured goods rose by 28 per cent, or two-thirds of the total rise in import value. This leads us to the conclusion that home producers were losing ground in the British market to foreign competitors. In the same way, the disappointing performance of exports was due, not to lack of overseas demand—world trade in manufactures rose by about 15 per cent in 1964—but to the diminishing competitiveness of British products.

(i) Remedial Measures.

The timing of Government action on the balance of payments position was influenced by the General Election of mid-October. The out-going Government had been concerned with the impending Election, and argued that the deficit was abnormal and could be expected to improve without remedial action. On taking office, the new Government decided that immediate remedial action was necessary. Three courses were possible. It could devalue the pound and so improve the competitive position of British exports and import-substitutes (*see* G8). But a devaluation was seen to have disadvantages. The price of necessary imports would be increased and this would lower the British standard of living; the ensuing wage demands would make it more difficult to implement an Incomes Policy—which is an alternative method of improving the British competitive position in world markets (*see* G33). Furthermore, the devaluation of the pound might have necessitated the devaluation of other currencies including the dollar: this would have defeated the purpose of the devaluation. These real arguments against devaluation are not to be confused with the spurious argument that devaluation is somehow morally wrong. A second possible course of action was to reduce imports to a satisfactory level by the deflation of the economy. However, national income would have to fall by a multiple of the required cut in imports. Deflation was rejected because it would cause unemployment and because it was considered to provide only a short-term solution to Britain's economic problems: somehow the foreign imbalance had to be corrected without impeding the growth of output and productivity. A third course of action was to impose import controls or tariffs and export subsidies. Import controls were rejected: for one reason, it would take time to set up the necessary administrative machinery. So it was that the Government decided upon an additional import tariff and an export subsidy.

Within two weeks of coming to power, the Government announced its measures (which had in fact been investigated by the previous Chancellor). There was to be an immediate but temporary surcharge of 15 per cent on all imports of manufactures and semi-manufactures: the more necessary imports such as foodstuffs and basic raw materials were excluded. A new system of export rebates was introduced, representing the indirect taxes paid in Britain by British exporters, mainly duties on oil, petrol, and vehicle licenses. The value of the rebate averaged 1½ per cent of the value of exports. The import surcharge was critically received by the other EFTA members; it clashed with their objective of eliminating all tariffs by the end of 1966.

Some commentators have argued that Britain should direct its policies towards removing restraints on trade, by cutting tariffs within EFTA or GATT or even unilaterally: lowering tariff barriers will contribute to efficiency by subjecting British industries to stiffer competition. By contrast, it is also possible to argue that we should at times impose greater restraints on imports, so that economic growth can occur without being hampered by balance of payments difficulties. The Government defended its action to the GATT Council in terms of an article in the Treaty which allows parties in balance of payments difficulties to resort to tariff restriction (*see* G9). Regret-

tably, the GATT Council declared the import surcharge a violation of the Treaty

(ii) Speculation Against Sterling.

The long-term capital outflow in 1964 of £400 million was as remarkable as the deficit on current account. The outflow was due to an increase in private investment abroad; there was no increase in net Government lending. Part of the net private capital outflow in the first half of the year may have been abnormal and part in the second half of 1964 may have been related to the growing current account deficit: portfolio investment in this country was not an attractive proposition, and foreign firms tended to repatriate any funds available.

There was a net short-term capital inflow in the first half of 1964, which financed the growing overall deficit. The crisis arose in the second half of the year, when an outflow of short-term capital—a "flight of hot money"—took place in expectation that a British devaluation would be necessary to cure the worsening imbalance. To protect the reserves, the IMF granted Britain a stand-by credit of £330 million. However, once the feeling developed that the pound would have to be devalued, the process became cumulative: the greater the outflow the more likely it seemed that Britain would be forced to devalue. A great deal of sterling was offered for sale by speculators holding pounds—the "Gnomes of Zurich"—and by British exporters and foreign importers who would be requiring foreign currency in future. In order to prevent the price of sterling from falling below the official minimum limit to the exchange rate of £1 = $2·78 (*i.e.*, to "support sterling") the Bank of England was itself forced to buy pounds. To do this the Bank had to draw on the country's reserves of gold and foreign exchange. The vast drain on the reserves could not be allowed to continue, and in late November, Bank Rate was raised by 2 per cent to 7 per cent. The aim of this measure was to lure back short-term capital funds with the high rate of interest, and also to convince speculators that the pound would not be devalued. Speculators were not convinced, however, and the crisis continued. Two days later it was announced that an enormous loan totalling £1,070 million would be made available to Britain from all the leading Western central banks. This news was sufficient to slow down the speculative outflow, and by the close of 1964 the selling had come to an end.

Events Leading to Devaluation.

Imports increased a good deal more slowly than output in 1965; rising by only 1 per cent. This was partly because the stockbuilding of 1964 had come to an end, and partly because the import surcharge held back imports of manufactured consumer goods. The value of exports was 7 per cent higher in 1965 than in 1964, and their volume 5 per cent higher. Thus the current deficit was more than halved, from the record of £400 million in 1964 to just over £100 million in 1965. The deficit on long-term capital was also cut considerably. Nevertheless, an overall deficit amounting to £350 million in 1965 had to be financed by monetary movements.

The trade balance showed little improvement by mid-1965, and in the third quarter fear of devaluation led to yet another run on sterling, probably as severe as that of November 1964. The Government was again forced to draw on the IMF and to borrow from the United States Federal Reserve Bank. This time, however, the extent of speculation against the pound was successfully concealed. When the trade balance improved rapidly in the second half of 1965, the speculation died away.

However, this progress did not continue into 1966, and confidence in the pound was further upset by the seamen's strike in May and June. Yet another flight of short-term capital occurred; and this led the Government in panic to introduce a policy of deflation, in a package-deal known as the "July measures" (*see* G36). Only two measures improved the balance of payments directly: a reduction of the personal travel allowance outside the sterling area to £50 per annum and a proposed cut in Government overseas spending. The fall in demand resulting from the deflationary policy, together with a wage-freeze introduced at the same time (*see* G34), improved the trade balance and actually turned it into a surplus at the end of 1966. But it should be remembered that this improvement was achieved only at the cost of some unemployment of men and machinery and a slower rate of economic growth.

Imports rose in value by over 6 per cent and exports fell in value by nearly 2 per cent between 1966 and 1967. Thus the trade gap which had almost closed in 1966 widened to a record level in 1967. The rise in imports cannot be explained simply by the rise in demand, as incomes rose by only 1 per cent between the two years: the "July measures" were taking effect. One reason for the surge in imports was the removal of the temporary import surcharge in the preceding November, which caused a postponement of purchases until 1967, and reduced the price of imported goods competing with British products. Other reasons were the building up of imported stocks which had been depleted, and the Middle East war in June, which raised the price of essential oil imports. The main reason for the fall in exports was the exceptionally slow growth of world production in 1967: demand in the countries importing British goods was fairly stagnant. Exports were also hit by the dock strikes in September. The long-term capital account improved still further in 1967. Nevertheless, the deficit on current plus long-term capital account in that year was no less than £540 million. With the trade returns deteriorating, sterling came under almost unremitting speculative pressure from the end of May onwards, reaching a climax in November.

Devaluation of the Pound.

The Government recognised that action would have to be taken to improve the balance of payments, and to obtain further foreign loans to protect the depleted reserves. The same alternatives were open as in 1964: deflation, import controls, tariffs and devaluation (*see* G28). Simple deflation to reduce imports was ruled out politically as the economy was now already in recession. Import controls and tariffs would meet with resistance from Britain's competitors and the GATT, and tariffs had been tried in 1964 without success. The Government decided to devalue the pound.

The case for devaluation is a mixed one (*see* G8 and 28). It makes imports more expensive relative to home-produced goods, and so demand for manufactured goods shifts away from imports; but in the case of food and raw materials, Britain must continue to import these essentials at the higher price because there are no domestic substitutes. It is possible, therefore, that devaluation will actually raise the import bill. However, export receipts should be increased by a greater amount: Britain exports its products in a highly competitive market, so that the reduced price of British goods in terms of foreign currencies should lead to a considerable increase in the amount of exports.

This improvement in the trade balance depends on Britain being able to retain at least part of the price advantage gained by devaluation. However, since devaluation raises the price of imported goods, it raises the cost of living both directly and indirectly, *e.g.*, imported raw materials rise in price, so increasing production costs, which are passed on as higher prices. The trade unions react to this cut in the standard of living by demanding wage increases. In this way a spiralling inflation could occur which would entirely neutralise the gain from devaluation. Devaluation makes an incomes policy both more difficult and more important (*see* G33).

On November 18, 1967, the pound was devalued by 14·3 per cent, from $2.8 to $2.4 to the £. Devaluation was anticipated by speculators, and on the day before, there was a run on the pound said to be greater than any previously experienced. The devaluation was unfortunately delayed by the need to achieve international co-operation so as to prevent a flurry of competitive devaluations. As it was, only a few minor currencies—including those of Denmark, Hong Kong, Ireland, Jamaica, New Zealand, and Spain—were devalued with sterling. It was also agreed among central

bankers that Britain should be given credits of up to $3,000 million, including $1,400 million standby credit from the IMF (*see* G8). This credit protects the reserves against speculation: but it will have to be paid back out of balance of payments surpluses over the next few years.

Devaluation increases the demand for domestically produced goods and services: imports are replaced by local substitutes and foreign demand for British goods increases. This switch in demand requires also a switch in scarce resources—labour and capital—into the exporting and import substituting industries, if the new demand is to be met. To release resources for these industries it is necessary to reduce the demand for resources elsewhere in the economy. Accordingly, the devaluation was accompanied by a series of deflationary measures (*see* G36).

The International Monetary System.

(i) International Liquidity.

Imbalance in payments between countries is financed by transfers of gold or foreign exchange (*see* G8). These reserves of gold and foreign exchange are known as *international liquidity*. Their basic characteristic is general acceptability: they can perform their function only if they retain the confidence of those engaged in international transactions. Unless it is ultimately convertible into goods and services, gold has merely an industrial and ornamental value. But since most central banks are prepared to buy and sell gold at a fixed price in terms of their local currency, confidence in gold is maintained.

Two *international reserve currencies* have emerged to supplement gold: the pound and the dollar. The pound has performed this function since World War I, but the dollar has become the main reserve currency since World War II. Surplus countries are prepared to hold short-term debt in pounds or dollars—so earning a rate of interest—confident that their future trading deficits can be financed by payment of these currencies or by their conversion into gold. These holdings are the *dollar* and *sterling balances* (*see* G7–8). Like gold, they can perform their function as international reserves only if there is confidence that they can be converted into other currencies and hence into goods and services at current exchange rates. There is one other form of international liquidity—drawing rights on the IMF (*see* G8). At the end of 1967 gold accounted for 56 per cent of total international liquidity, foreign exchange reserves for 36 per cent, and the IMF for 8 per cent.

In recent years two developments have undermined the present international monetary system. First, the growth of international trade has outstripped the growth of reserves with which to finance imbalances in this trade. Between 1952 and 1966 world trade, measured in dollars, rose by 140 per cent, whereas international liquidity, measured in dollars, rose by only 30 per cent. Gold reserves have been a declining proportion of international liquidity, partly because gold production has been hampered by the fixed price in the face of rising costs of gold production, and also because an increasing proportion of newly-mined gold has found its way into private speculative hoards and not into official stocks. The other main source of new international liquidity was an increase in dollar balances. By 1967 dollar balances actually exceeded the United States gold reserves.

The second problem to have emerged is the weakness in the balance of payments of the reserve currency countries. Both Britain and the United States have had persistent deficits in recent years. As a result there have been periodic fears that the dollar or the pound would be devalued in terms of gold and other currencies: and this has resulted in speculation against the dollar and the pound (*see* G28). The inadequacy of international liquidity and the weakness of the reserve currencies produces a dangerous "deflationary bias" in the world economy (*see* G9).

(ii) The Gold Crisis 1968.

The United States has run a large and persistent payments deficit in the 1950s and 1960s. This was initially financed through the willingness of foreigners to run up dollar balances. However, distrust of the dollar has grown, and between 1960 and 1967 U.S. gold reserves were run down, from $19,500 million to $12,100 million. After the devaluation of sterling in November 1967, the interest of speculators transferred from the pound to the dollar. Since many speculators expected the devaluation of the dollar in terms of gold to be followed by a corresponding devaluation of other currencies, there was a growing demand for gold.

After 1961 the central banks of the major trading nations operated a *gold pool* in the London market, whereby they agreed to exchange gold for currencies at existing official exchange rates. But with the growing speculation against the dollar, the system could not be continued without endangering the U.S. gold reserves. The central bankers gathered for a crisis meeting in Washington on 17 March, and decided to terminate the gold pool. They introd[illegible] two markets for gold, with private transactions [illegible]ing place in the free market at a price determined [illegible] supply and demand, and transactions among [illegible]ral banks taking place in the official market at [illegible] official gold price. The United States was now [illegible]red to convert dollars into gold only for cen[illegible]l banks, *i.e.*, to finance a deficit only on its current plus long-term capital account. In this way speculation against the dollar could be controlled; but the problem of the U.S. deficit on current and long-term capital account was still to be solved.

(iii) Reform of the International Monetary System.

There is an increasing shortage of international liquidity, which gives a deflationary twist to the world economy and threatens the continuation of free trade. What means are available to increase international liquidity? There are two main alternatives: a rise in the price of gold in terms of all currencies or the creation of an international paper money.

A rise in the gold price would increase international liquidity: first, by increasing the money value of existing gold reserves, and second, by encouraging gold production. However, there are certain disadvantages. It helps those countries most which need help least—those with large gold reserves: it represents a victory for the gold speculators and so acts as a stimulus to further hoarding and speculation in the future; it helps in particular the gold-producing countries Russia and South Africa; and finally, it represents a sheer waste of economic resources: gold has little value except as a means of international payment. The most likely method of securing a general rise in the price of gold would be a devaluation of the dollar, since most other currencies would be devalued simultaneously. Therefore, devaluation could not cure the U.S. deficit. For these reasons the United States Government decided against devaluation of the dollar at the time of the gold crisis.

The domestic currency of the United Kingdom is not backed by gold: on a one pound note the Governor of the Bank of England promises to pay the bearer on demand the sum of one pound—another pound note! Yet, within Britain, there is complete confidence in the currency, because it is generally acceptable and so convertible into goods and services. Just as gold no longer backs the domestic currency, there is no need for gold in settlement of international payments. All we need is a generally acceptable international currency, *i.e.*, one in which all countries have confidence.

Such a currency could be created by an international authority constituted for this purpose: and it could be made available to deficit countries, which could then pay their creditors in the new currency. In this way the current shortage of international liquidity could be made good, and indeed gold—Keynes' "barbarous relic"—could be supplanted. There are various difficulties in such a scheme. It would involve some loss of national autonomy and the vesting of considerable power in the international authority issuing the paper currency. Decisions would have to be made as to which countries should receive the new currency, and in what quantities. And there is a fear that it would enable reckless governments to pursue inflationary policies without the discipline

imposed by shortage of reserves, and that their inflation would be infectious. Many variations on this basic scheme have been devised in an attempt to surmount these—largely political—objections.

(iv) Special Drawing Rights.

In the past the IMF has merely provided deficit countries with loans, to be repaid over a certain period (*see* G8). However, the amount of these credit facilities has been increased over time. In 1959 the quotas paid by members to the IMF were raised by 50 per cent, and in 1964 by a further 25 per cent. Moreover, in order to increase the resources available to neutralise the massive movements of short-term funds which had so disrupted balance of payments in 1960 and 1961, the IMF initiated a scheme for a "lenders' club". In December 1961 the main trading countries—the *Group of Ten*—undertook (subject to some control by lending countries over the use of the funds) to make available loans totalling over £2,000 million to the IMF for relending to countries of the Group suffering an outflow of short-term funds.

In September 1967 the members of the IMF agreed in principle to a scheme according *special drawing rights* (SDRs) to member countries. SDRs will be distributed annually to all members in proportion to their quotas with the IMF. They will have a fixed value in terms of gold, and like gold, will be generally accepted as a means of payment. Thus a deficit country can use its SDRs to buy the currency of the countries with which it has a deficit, and the surplus countries, in accumulating SDRs, earn a rate of interest on them. This is a movement towards an international paper currency, since the SDRs, unlike IMF loans, do not have to be repaid: they will be a permanent addition to international reserves. The amount of SDRs which has been proposed is small in relation to the size of the problem, and the scheme has yet to be put into practice; but it is a step in the right direction.

Trading Arrangements.

(i) First Application for Membership of the Common Market.

In mid-1961 it was announced that Britain would apply for full membership of the *European Economic Community*, otherwise known as the Common Market. The European Economic Community (EEC) consists of six full members—Belgium, France, Holland, Italy, Luxembourg, and Western Germany (*see* G9). Britain had participated in the negotiations which led up to its formation, and had argued in favour of a looser "free trade area" without a common external tariff, and excluding trade in agricultural products. No compromise acceptable to the six was found, and Britain joined with six other European countries—Austria, Denmark, Norway, Portugal, Sweden, and Switzerland—in forming the *European Free Trade Area* (EFTA).

Later, however, when the Common Market proved to be highly successful in terms of the growth of production and trade, the British Government decided to apply for membership. There were three main problems to be solved in the negotiations. The first two—the trading links with Commonwealth countries, and the position of British agriculture—were those which had influenced the British attitude in the earlier negotiations. Now Britain also had obligations to her trading partners in EFTA. The Common Market countries welcomed the British application, but made it clear that renewed negotiations must take place within the framework of the Treaty.

(ii) The British Proposals.

The British delegation made the following proposals for the solution of Britain's special problems. For British *agriculture* there was to be a long "transition period"—that is to say, a period for adjustment before British agriculture became fully integrated into the Common Market agricultural arrangements—possibly 12 to 15 years from the date of joining the Common Market. By contrast, it was not proposed to negotiate for favourable conditions for British *industry*: on joining the Common Market, Britain was prepared to make a reduction in her tariffs equivalent to the reductions which had already been made by the Six.

Two lines of approach were suggested for protecting the trading positions of the underdeveloped countries of the Commonwealth. One involved granting those countries the status of "associated territories" which would give their products access to European markets on preferential terms. There was a precedent for this sort of arrangement, in that France had already negotiated associated status for some of her former colonies in Africa. But it was recognised that the Six might not be prepared to offer associated status to some of the larger underdeveloped countries of the Commonwealth—*e.g.*, India, and that some countries might wish to reject an offer of associated status for political reasons. As an alternative, therefore, it was suggested that the Common Market external tariff on some of the more important agricultural exports from these countries—*e.g.*, Indian tea—should be reduced or eliminated; and that arrangements should be made to ensure that the external tariff on manufactured goods exported from these countries—*e.g.*, textiles from Hong Kong—did not lead to a reduction of such exports. For the more developed countries of the Commonwealth, there were proposals that the Common Market external tariff on raw material imports should be reduced or eliminated for certain Commonwealth produced materials, such as aluminium, zinc, and woodpulp. It was also proposed that certain arrangements should be made with respect to foodstuffs—chiefly wheat, meat, and dairy products—produced by developed members of the Commonwealth. The principle underlying these arrangements, it was suggested, should be that Commonwealth producers "be given in the future the opportunity for outlets for their products comparable to those they now enjoy."

(iii) The Negotiations.

In the course of prolonged negotiations, considerable progress towards a final agreement was gradually made: progress in reducing tariffs important in Commonwealth trade, in agreeing that Commonwealth countries in Africa and the West Indies should be offered associated status on the same terms as the ex-French territories, and in agreeing that the problems of India, Pakistan, and Ceylon could best be solved by trade treaties negotiated between the Common Market and these countries. The problem of temperate foodstuffs proved the most intractable. Britain wanted specific arrangements to ensure that Commonwealth-produced temperate foods would be able to find markets in Europe, at least in the short term. France made it clear that she envisaged a reduction of food imports into Common Market countries, to permit an expansion of her agricultural output: this point of view was clearly incompatible with the British proposal for "comparable outlets" for Commonwealth producers. Nor was there agreement on the transitional arrangements for British agriculture.

Nevertheless, it was the opinion of many observers that by January 1963 the stage had been set for a final round of bargaining, and that given goodwill on both sides Britain's entry could have been assured. It therefore came as a surprise when France decided that the negotiations should be broken off. Despite opposition from the other five, a French veto was imposed on the British application. Perhaps the fundamental reason for the breakdown can be inferred from a statement attributed to General de Gaulle: "The Europe I prefer is the Europe of the Six."

(iv) Britain's Second Application.

In 1967 the British Government again began discussing with the EEC countries the possibility of British membership. This move had the support of most British industrialists: a Confederation of British Industry Survey in March showed that 90 per cent of replying companies believe EEC

membership would be to their advantage. Confidential discussions went on; but in December, France vetoed the opening of negotiations on Britain's entry.

Economists are by no means agreed on the economic value to Britain of joining the Common Market: a lot depends on the precise terms of entry and on unmeasurable factors. Moreover, entry to the EEC is as much a political decision as an economic one. *See* C49–53.

2. INTERNAL DEVELOPMENTS

Industrial Output and Employment.

In the fourth quarter of 1967, industrial production was 34 per cent higher than it had been in 1958. This expansion occurred largely in two spurts: during the twelve months between March 1959 and March 1960 industrial output increased by 11 per cent, and between March 1963 and March 1964 it rose by 14 per cent. The three years before March 1959, the three years between the booms and the three years after March 1964 were periods of industrial stagnation. The table also indicates that the numbers employed in industry were only 1 per cent higher near the end of 1966 (allowing for seasonal variation) than in 1958, so that productivity—output per person employed—rose by about 33 per cent over the period. Here again, a very high proportion of the increase was secured in the boom periods.

INDUSTRIAL PRODUCTION, EMPLOYMENT, AND PRODUCTIVITY, 1959–67
(Quarterly averages of seasonally adjusted index numbers, 1958 = 100)

Year	Quarter	Industrial production (1)	Employment in industry (2)	Productivity in industry 100 × (1) ÷ (2)
1959 . .	I	102	100	102
1960 . .	I	112	102	110
1961 . .	I	114	104	109
1962 . .	I	114	104	110
1963 . .	I	113	101	112
1964 . .	I	127	103	123
1965 . .	I	132	105	125
1966 . .	I	134	106	126
1967 . .	I	132	103	129
1967 . .	IV	134	101	133

Restriction and De-restriction.

The 1960s have witnessed several changes in the emphasis of Government monetary and fiscal policies. In the first half of 1960 the emphasis was on restrictive policies, both because of the deterioration in the balance of payments position, and because it was apparent that the very rapid expansion of output had created shortages and inflation in the economy at home. No doubt there would have been a slowing down in the rate of growth of output even if restrictive measures had not been taken: an increase as rapid as that in 1959 was possible only because a substantial excess capacity had developed over the preceding years. But the measures taken to restrict demand reinforced this tendency, and growth in industrial output was halted.

A relaxation of restraints did help to stimulate some increase in output in the early months of 1961. But from July 1961—again primarily for balance of payments reasons—there was a phase of even sterner restrictions. The progressive relaxation of restrictions during the summer of 1962, coupled with measures designed to stimulate industrial output, had not had any major effect by the end of the year.

In some ways, the situation early in 1963 was analogous to that of early 1959. There was a substantial under-utilisation of capacity in many branches of industry, since some new investment had continued in 1960–62. Labour resources for expansion were available, in that unemployment —at over 3 per cent—was higher than in any period since the war. Consequently the expansionist policies of 1963 helped to produce a year of boom which saw a spurt of industrial output, and a substantial increase in productivity. This progress could not be maintained in 1964, when industrial production and productivity flattened out, and the balance of payments deteriorated. However, the 1960 remedy of deflation was not immediately repeated; it was now realised that "stop-go" policies were harmful to the growth of the economy, and that the balance of payments problem would have to be solved by other measures. Full employment was maintained between 1964 I and 1966 I, but industrial production per man rose by only 1·5 per cent per annum. Two reasons have been suggested for this slow growth of productivity: a decline in the average working week (output per man-hour increased more rapidly), and the tendency of employers to adjust their labour force to the level of production only with a considerable delay.

Balance of payments difficulties eventually led the Government to deflate the economy; and there was a fall in industrial production in the second half of 1966 as the July measures took effect. Employers now began to lay off workers, and unemployment doubled from 1·2 per cent of the labour force in early 1966 to a peak of 2·4 per cent in late 1967, when over 500,000 workers were unemployed. Despite all the promises, the *stop-go cycle* had not been broken.

Regional Planning.

Much publicity has been given in the 1960s to the varying degrees of prosperity and levels of unemployment in the United Kingdom (*see* G13). Government measures are necessary to reduce disparities and probably even to prevent them from growing.

There are essentially two ways of tackling the problem of regional imbalances: taking jobs to the people or bringing people to the jobs. In so far as the latter alternative is chosen, the Government should encourage the mobility of labour, *e.g.*, through retraining schemes or a housing subsidy. However, the migration of population may damage community life in the denuded areas, and cause congestion, housing shortages, and overcrowding in the booming regions. The Government can create employment opportunities in the relatively depressed regions in various ways. It can try to induce expanding industries to set up new plants in these regions by offering tax incentives; it can authorise additional expenditure on public works —*e.g.*, by accelerating road-building programmes —to provide additional employment; it can place orders for the goods it needs—*e.g.* defence contracts—where work is required.

On taking office in October 1964, the Labour Government made regional planning the responsibility of its Department of Economic Affairs. Britain was divided into eight regions, with the intention of producing a plan for each region. The Government also established two kinds of planning body: regional economic planning Councils and Boards to advise on and co-ordinate the planning of each region.

Recent Government policy to cure regional unemployment has taken the following forms. Various measures to defer public construction programmes have excluded the "Development

Areas." Fiscal incentives to locate industry in the depressed regions have been given, *e.g.*, the cash grants provided since 1966 for new plants and machinery in manufacturing are at twice the national rate in the Development Areas. By contrast, office building in the main conurbations, London and Birmingham, was strictly limited. To encourage the mobility of labour, the Government introduced redundancy compensation and achieved some expansion in both public and private training facilities. In 1967 regional differentials in the selective employment tax were introduced (*see* G36). Under this scheme manufacturers in Development Areas are paid 30*s*. per week for each full-time adult male employee and lower amounts in respect of other workers; so giving the Development Areas a wage cost advantage in manufacturing of 5–10 per cent.

Planning for Faster Growth.

There has been an increasing dissatisfaction with the rate of growth achieved in this economy over the past decade or so. The economies of most Common Market countries have increased their industrial output at a much faster rate. Furthermore, there has been dissatisfaction with the way in which the economy has grown: the characteristic pattern has been one of sharp bursts of expansion interrupted by rather lengthy periods of stagnation.

(i) The National Economic Development Council.

To stimulate a more systematic study of the problems involved in securing a faster and more even rate of growth in the British economy, the Conservative Government established the *National Economic Development Council* (NEDC or "Neddy"). The two-tier organisation was similar to that of the corresponding planning council in France. The Council itself consisted of representatives from the T.U.C. and employers' organisations, Government ministers and independent members, and it was served by a group of experts. This group undertook research into the problems of securing a faster rate of growth, into the means of overcoming obstacles to growth, and into the economic policies which could be most conducive to faster growth.

In its first report, in 1963, the Council made a projection for the economy. It adopted a target rate of growth of output over the period 1961–66, equal to 4 per cent per annum, which was substantially faster than the rate of growth actually achieved in previous years. It attempted to predict how investment, exports, imports, consumption, and the output of each industry would have to grow if the target rate of growth was to be achieved. The merit of this exercise was twofold: it helped to focus Government attention on the long-term, by showing that policies designed to solve short-term difficulties might intensify the problem of raising long-term economic growth; and, by bolstering expectations, it encouraged firms to invest.

A particularly interesting feature of the work of the NEDC is its study of individual industries. Seventeen major industries were surveyed in detail to assess the changes in output, employment, productivity, investment, and exports which were feasible in each industry. Economic Development Committees (EDCs)—which have come to be known as "little Neddies"—were established as part of the NEDC machinery to report on the problems of individual industries. It is impossible for an individual firm or industry to make correct decisions on future expansion without knowing how the rest of the economy will behave; by relating planning at the national level and planning at the level of individual industries the NEDC did valuable work.

(ii) The Department of Economic Affairs.

In October 1964 the Labour Government established a new *Department of Economic Affairs* (DEA). While short-term measures to regulate the economy or the balance of payments remained the responsibility of the Treasury, the DEA took over from the Treasury the responsibility for long-term economic policy. The DEA was charged with the task of preparing and implementing a realistic plan for economic expansion, a prices and incomes policy and an industrial and regional policy. The NEDC, now reconstituted, appears to have become a consultative and advisory body: a link between the Government and the economic community. However, the EDCs continue to function and have produced a great many reports. *See also* C29.

(iii) The National Plan.

The National Plan for the British economy over the period 1964–70 was published by the Government in 1965. The Plan was based on the assumption that output would rise by 3·8 per cent per annum over the period. Since the labour force was expected to grow at 0·4 per cent per annum, this meant an annual growth in productivity of 3·5 per cent—considerably higher than the 2·7 per cent average over the period 1960–64. The Plan specified the changes in investment, consumption, and public expenditure required to achieve this target.

In many ways, the crucial assumptions were those concerned with the balance of payments. The Plan supposed that imports would increase by 4·0 per cent per annum, and that to achieve a "satisfactory" surplus of £250 million on the overall balance of payments in 1970, exports would have to rise by 5·6 per cent per annum. If such a rapid expansion of exports were not achieved—and in the period 1960–64 the annual increase averaged only 3·1 per cent—the whole Plan could be jeopardised, in that the balance of payments difficulties might, as in the past, appear to justify policies to restrict the growth in domestic output.

Indeed, this is precisely what happened. The tardy improvement in the balance of payments led the Government eventually in July 1966 to deflate the economy. The ensuing stagnation has meant that the Plan's targets for 1970 can no longer be achieved. However, it should not be concluded that planning is necessarily an academic exercise: planning has a valuable sight-setting function; it can bolster firms' expectations and hence their investment; and it can help to co-ordinate their decisions. Rather, we should recognise that planning is worthless unless combined with Government policies which enable the planned targets to be reached.

Wages and Prices.

Retail prices have continued to edge upwards in the early years of the 1960s: in 1967 they were 29 per cent higher than in 1958. Hardly any of this increase can be attributed to an increase in import prices. To explain the inflation we must look to the behaviour of labour costs. Between 1958 and 1967 the nationally negotiated weekly wage rates rose by 40 per cent, and weekly earnings—including overtime payments and payments negotiated on the factory-floor—by 61 per cent. Since the increase in productivity over this period was slow, income from employment per unit of output (indicating labour costs per unit of output) rose by 32 per cent.

One of the main dangers of this inflation of costs and prices is that exporters will find it more difficult to compete in foreign markets. Export prices in fact increased slowly. But this may well imply that producers were having to accept lower profit margins on exports than on sales in the home market; and this would not encourage producers to push their sales in overseas markets.

Incomes Policy.

Britain's competitive position in world trade has deteriorated relative to that of her main rivals the United States, West Germany, and France; hence her balance of payments difficulties. The British share in total world exports of manufactures fell from 17·7 per cent to 11·9 per cent between 1959 and 1967. There are essentially two methods of remedying this situation. We must secure either a relative fall in the external value of the pound, or a relative rise in its internal

value. In other words, either there must be a devaluation of the pound in terms of other currencies, or we must have a policy to limit the increase in the British price-level. Up to 1967 the Government concentrated on the latter alternative; and attempts were made to introduce some form of *incomes policy*. In 1967 the Government opted for devaluation; but incomes policy was still necessary if the devaluation was to be successful.

(i) The Pay Pause.

In July 1961 the Chancellor of the Exchequer called for a "pause" in wages, salaries, and dividend payments. Exhortations for restraint have been a familiar feature of ministerial statements for many years, but on this occasion the Government soon made it clear that it intended to use such power as it has to influence the amount and timing of wage and salary awards. It has power to decide when the pay awards recommended by the Wages Councils—which fix minimum wages for 3½ million workers—shall be implemented. The Government's power is strongest over workers which it directly or indirectly employs, *e.g.*, civil servants, teachers, and Post Office workers. Their pay awards were cut back. The Government also had a limited influence on awards made in nationalised industries.

The "pay pause" came to an end in April 1962. It was envisaged as a temporary policy, and its effects are difficult to assess. It certainly postponed some wage awards which would otherwise have been made in that period, and it may have contributed to a stiffening of resistance to wage claims. But because the pause affected some groups of people more severely than others, this form of incomes policy was seen to be discriminatory.

(ii) The National Incomes Commission.

In February 1962 the Government issued a White Paper which outlined its incomes policy for the period after the pause. It stated that "the objective must be to keep the rate of increase in incomes within the long-term rate of growth of national production. . . . In recent years national production has risen by about 2 to 2½ per cent a year. . . . It is accordingly necessary that the increase of wages and salaries, as of other incomes, should be kept within this figure during the next phase." The Government stressed that most of the arguments which had in the past been advanced in justification of wage and salary claims—*e.g.*, increases in the cost of living, trends in productivity or profits in particular industries, and comparisons with levels or trends in other employments—should be given less weight; and that "general economic considerations"—*i.e.*, the increases which the economy can afford given the prospective rate of increase in national production—should be given more weight.

Late in 1962 the Government set up the *National Incomes Commission* (NIC). However, the powers of this body were limited. It could not participate in, nor comment upon, wage claims while negotiations were in progress unless the parties involved consented; and as the T.U.C. did not intend to co-operate with the Commission, such consent was unlikely. It could be asked to report on inflationary settlements which had been reached (unless the settlement was reached by arbitration); but it had no power to cancel or modify an agreement. NIC produced only 4 reports, and was wound up after the change in Government.

(iii) The National Board for Prices and Incomes.

In October 1964 the Labour Government's new Department of Economic Affairs was made responsible for achieving an incomes policy. The lessons of the past had been learned; the Government recognised that a successful incomes policy would require the support of both sides of industry. Its first objective was to achieve a "Joint Statement of Intent on Productivity, Prices and Incomes"; this was signed in December 1964. In this document the T.U.C. and the employers' organisations undertook to co-operate with the Government in producing an effective machinery for the implementing of an incomes policy.

It was Government policy that growth in earnings per employee should equal the planned growth in national output per employee of 3–3½ per cent per annum. Thus, in those industries (*e.g.*, engineering) in which productivity growth exceeds this "norm", earnings should rise less rapidly than productivity, and in those industries (*e.g.*, railways) in which productivity growth falls short of the norm, earnings could rise more rapidly than productivity. Moreover, prices would be expected to fall in industries such as engineering, and permitted to rise in industries such as railways. Growth in earnings per employee should exceed the norm only in exceptional cases; *i.e.*, as a reward for increasing productivity by eliminating restrictive working practices; if necessary to transfer labour from one industry to another; if earnings are too low to maintain a reasonable standard of living; or if a group of workers have fallen seriously out of line with earnings for similar work.

To make specific recommendations on the basis of this policy, the Government set up a *National Board for Prices and Incomes*. It consists of an independent Chairman, a number of independent experts, a businessman and a trade unionist. The Prices Review Division of the Board can investigate the price of any goods in the economy, and the Incomes Review Division has power to investigate all claims and settlements relating to wages, salaries, and other incomes. In less than 3 years of operation the Board had produced some 60 reports on prices and earnings.

There was no statutory authority to enforce the recommendations of the Board; reliance was placed on voluntary methods and the power of persuasion and public opinion. However, in late 1965 the Government introduced a compulsory "Early Warning" system, whereby it is notified in advance of any intended increase in incomes or in certain prices. As a result, the Government and the Board now have enough time to consider increases before they are put into effect.

(iv) The Prices and Incomes Standstill.

A voluntary incomes policy is very difficult to implement, since it depends on co-operation among Government, workers, and employers; moreover, co-operation among representatives at the top may be undermined by "wage-drift" at the factory level. Thus the annual average of weekly wage-rates rose by no less than 6 percentage points between 1965 and 1966. In fact all of this increase took place in the period before July 1966. Clearly the voluntary incomes policy was meeting with little success.

Therefore, as part of the July measures taken to deal with the balance of payments problem, the Government introduced a "prices and incomes standstill." Increases in prices and incomes were as far as possible avoided altogether until the end of 1966. The only exceptions in the case of incomes were pay increases resulting directly from increases in output (*e.g.*, piece-work or overtime earnings) and from genuine promotion or regular increments on a predetermined scale. Increases already negotiated but not yet implemented were deferred for 6 months. The first half of 1967 was a period of "severe restraint." Any price increases were carefully examined, and the norm for income increases was zero. Any increase in earnings had to be justified by one of the four conditions for exception, referred to above. To enforce its "freeze" the Government took the unprecedented step of asking Parliament for reserve powers, which were to be used only if the need should arise. These powers—including penalties for offenders—were contained in the new Part IV of the Prices and Incomes Act. For the most part, there was a voluntary observation of the standstill; but from October 1966 the Government found it necessary to exercise its power of compulsion in a few cases, *e.g.*, laundry and dry cleaning charges, and a wage agreement in the electrical engineering industry. The power of compulsion lapsed in August 1967.

(v) After the Standstill.

The period of compulsion was followed by a year in which there was to be a "nil norm" except where increases in incomes could be justified by one of the four criteria listed above. The Government could no longer legally enforce its policy, but it did retain the power to delay price and pay increases, through reference to the Board, by up to 7 months. Whereas the Government succeeded in almost stabilising wages and prices during the year in which it took compulsory powers, in the second half of 1967 weekly wage rates rose by 6 per cent. The advantage gained from the previous restraint was reduced but not entirely lost.

In April 1968 the Government published a White Paper outlining its policy for the period until the end of 1969. Wage increases must still be justified by the four criteria, and there is a ceiling to increases in income of 3½ per cent per annum except for "productivity agreements" and low-paid workers in certain cases. Price increases are permitted only as a result of unavoidable increases in cost per unit of output, and price reductions required when costs fall. Dividend increases are also subject to the ceiling of 3½ per cent per annum, and home rent increases are to be controlled. The Government intended to rely on voluntary co-operation of unions and employers over pay; but it decided to lengthen its delaying powers for pay and price increases to 12 months, and take powers to enforce price reductions recommended by the Board. Incomes policy was made both more difficult and more important by the devaluation of the pound: more difficult in that devaluation involved a cut in the standard of living, and more important in that the trading benefit from devaluation should not be neutralised by inflation.

Monetary and Fiscal Policies since 1960.

There is probably no country in the world which has made fuller use than Britain of budgetary policy as a means of stabilising the economy. Since 1941, almost all adjustments to the total level of taxation have been made with the object of reducing an excess in total demand or of repairing a deficit. Whereas in the United States there is still a public clamour for "balanced budgets," British Governments have accepted Keynesian principles—first laid down by Lord Keynes—for managing the economy by adjusting the level of taxation and private saving relative to public expenditure and private investment. This does not mean to say that British policies have always been successful. Apart from the difficulty of deciding when demand is excessive or deficient, there are the difficulties that data are available only with a serious time-lag, and may be inaccurate; that economic events cannot be predicted with any certainty; and that the quantitative effects of Government measures are not easy to estimate.

1960.

In the first half of 1960 there were a series of restrictive measures designed to curb the increase in home demand and to improve the balance of payments position. Bank Rate was raised to 6 per cent. To exert pressure on the banks' liquidity positions, and so help to curb bank advances, the banks were called upon to place special deposits (*see* G23) with the Bank of England. Restrictions on hire purchase transactions were also imposed. Furthermore, the Budget was restrictive: the Chancellor estimated an overall deficit (*see* G26) for 1960–61 of only £320 million.

1961.

The Budget was sternly anti-inflationary: profits tax and some indirect taxes were increased; but there was a major reduction in surtax. In addition, the Chancellor was granted powers to introduce, if he considered it necessary, an economic "regulator": a surcharge on, or rebate of, indirect taxes by up to 10 per cent. This power provides greater scope for using fiscal measures to influence the economy in the periods between Budgets. In July 1961 the Chancellor introduced a collection of restrictive measures. These measures were primarily intended to ease the critical foreign exchange situation but they were not without effect on the domestic economy Bank Rate was raised to 7 per cent. To restrict the growth in demand, the Chancellor imposed a 10 per cent surcharge in indirect taxation and called the banks to increase their special deposits at the Bank of England. Furthermore, the Chancellor announced that he aimed to restrict the increase in government spending. Not only was the outflow of funds stopped, but it was actually reversed. These measures were all too successful in restricting demand at home: there was a fall in industrial production in the second half of 1961.

1962.

The 1962 Budget was, however, no less restrictive in intention than the 1961 Budget. The estimated overall deficit, at £70 million, was virtually unchanged. There was a move towards uniformity of purchase tax rates. The main novelty of the 1962 Budget was a tax on certain speculative gains. From the summer of 1962 onwards, monetary and fiscal policies were designed to stimulate economic activity. Bank Rate was reduced to 4 per cent, all special deposits held by the Bank of England were released, qualitative restraints on bank lending were abolished, some post-war credits were released, investment allowances for industry were increased, and the purchase tax on cars reduced.

1963.

January 1963 saw further reduction in purchase taxes, and a very considerable increase in social payments. The estimated overall Budget deficit for 1963–64 was more than £600 million greater than that of the previous year. Tax reliefs were announced: the most important benefits to individuals were derived from increases in the allowances which can be charged against income before income tax is levied; in addition, Schedule A taxes were abolished for owner-occupiers. Other changes in taxation were designed to stimulate investment spending by companies: depreciation allowances were increased for tax purposes, and companies investing in areas of high employment were permitted to charge depreciation on their assets at a rate of their own choosing. The Budget was designed to provide a fiscal boost to the economy, and in this it succeeded: national output rose by more than 5 per cent over the year.

1964.

By 1964 the economy was beginning to show signs of strain, and the trade figures revealed a rapid deterioration in the balance of visible trade. The Chancellor's objective in his April budget was to slow down the rate of growth without producing deflation. He planned an overall deficit of £790 million, but provided for additional taxation by increasing the duties on tobacco and alcoholic drinks by about 10 per cent.

Both consumption expenditure and industrial production jumped sharply towards the end of 1964, and there were reports of a growing labour shortage. The balance of payments was heavily in deficit throughout the year. Nothing was done about it, however, until after the General Election in October. In November the Chancellor of the Exchequer presented a "little budget." An additional 6*d*. in the £ was placed on the standard rate of income tax, and there were increases in petrol duties, in National Insurance contributions and payments. But old-age pensions were increased. During the sterling crisis of November (*see* G29) Bank Rate was raised to 7 per cent to stem the outflow of funds, but this was not accompanied by a "credit squeeze" to restrict productive investments, as in the crisis of 1961. Unlike some of his predecessors, the Chancellor had not opted for deflation as the cure for the balance of payments deficit. Instead, reliance was placed on

an import surcharge and an export rebate. However, the British policy came under fire from some European Governments, who called for a deflation of the British economy.

1965.

The Budget contained two major fiscal innovations. A *corporation tax* was introduced to replace the existing company income tax and profits tax. This tax at a rate of 40 per cent, was imposed on distributed as well as undistributed profits, so as to encourage the retention of profits for the financing of business expansion. A further innovation was the introduction of a *capital gains tax*, far more comprehensive than the first move in this direction taken in 1962. This tax is levied on the gain realised on an asset between its purchase and sale, provided this does not exceed the gain between 6 April 1965 and sale. It applies to all assets, with limited exceptions: the most important being owner-occupied houses, and goods and chattels realised for less than £1,000. Gains realised within a period of one year are treated as ordinary income and taxed accordingly. Gains on assets held for more than a year are taxed at a flat rate of 30 per cent in the case of individuals. However, gains realised by companies over any period are taxed at corporation tax rates. There are many administrative difficulties in implementing such a tax. Nevertheless, it is an important attempt to remedy the inequality in the taxation of earned and unearned incomes.

Full employment was maintained in 1965. The April Budget was not deflationary: the Government's overall deficit for 1965–66 was estimated at £720 million. In July, because the balance of payments had shown no sign of rapid improvement, the Chancellor found it necessary to introduce further measures: tighter controls on foreign exchange and on the terms of hire-purchase, and a postponement of public expenditure programmes. But this action was not sufficient to produce deflation, and at the end of the year unemployment was still very low.

1966.

The 1966 Budget was somewhat deflationary: but its impact was delayed until September when the new *selective employment tax* (SET) came into force. All employers were required to pay this tax at the weekly rate of 25*s*. for men, 12*s*. 6*d*. for women and boys and 8*s*. for girls. However, manufacturing industries received a refund of 130 per cent, the public sector 100 per cent, while other industries—*e.g.*, services and construction—receive no refund. The tax discriminates against those industries which are labour-intensive, export little, and whose output bears little indirect taxation. The SET is therefore a rough and ready means of forcing employers to release hoarded labour, of subsidizing exports, and of evening up the incidence of indirect taxation.

Up to mid-1966 the Labour Government's policy can be summarised as follows: to restrict the growth of demand somewhat but not as drastically as in the past, to take direct action on the immediate balance of payments, and to strengthen the long-run balance by means of productivity policy and incomes policy. However, in July, during yet another run on sterling, the Government embarked on a policy of deflation. In its "July measures" the Government raised indirect taxation 10 per cent by means of its "regulator," placed a 10 per cent surcharge on surtax, tightened building controls, cut public investment for 1967/8, increased hire-purchase restrictions, and raised Bank Rate to 7 per cent. As a result of these measures, the economy went into recession in the second half of 1966.

1967.

Despite unemployment of 2·4 per cent and predictions of a further rise during the year, the Chancellor produced a "no-change" April Budget, with an estimated surplus of £640 million. The balance of payments prevented him from taking reflationary measures. In mid-year the Government gave some stimulus to consumers' expenditure by relaxing hire purchase terms and increasing family allowances. But the balance of payments deteriorated, and, since further deflation was politically unacceptable, the Government devalued the pound. Devaluation was itself strongly reflationary—increasing demand for exports and for import-substitute goods—and had to be accompanied by measures to release resources for these industries. Bank Rate was raised to the unprecedented height of 8 per cent, bank advances were limited to all but priority borrowers, *e.g.*, exporters, hire purchase on cars was tightened, corporation tax was raised to 42½ per cent, and the SET premium was to be withdrawn except for Development Areas.

There were also to be cuts in defence, other public spending and nationalised industries' investment. Further cuts in government spending were announced in December, and again in January, when future defence spending was considerably reduced because of the decision to withdraw forces from East of Suez, and the planned rise in the school-leaving age from 15 to 16 was put off until 1972. Despite these several blows of the axe, public expenditure was still likely to rise in 1968/9 by nearly 4 per cent in real terms: but the rise in 1969/70 was estimated to be no more than 1 per cent.

1968.

The April budget was highly deflationary. The Chancellor increased taxation to yield an additional £920 million per annum. Most of this came from indirect taxation, with purchase tax and taxes on spirits, wines, and tobacco all raised. Motorists were particularly hit by the increased vehicle and petrol taxes—perhaps not unfairly in view of the heavy social costs caused by road congestion. SET was to be raised 50 per cent, and betting duties were put up. Partly to gain support for the incomes policy, the Chancellor raised family allowances and placed a heavy "special levy" for one year on unearned income above £3,000 per annum.

In deflating the economy the Chancellor was attempting to reduce private consumer demand so as to free resources for the export market and for replacing imports. Without such a transfer of resources the advantage gained from devaluation would be lost. His strategy was to produce an overall balance of payments surplus of the order of £500 million before resuming growth, and in this way to break the vicious circle of "stop–go".

Decimalisation 1971.

The decimalisation of the currency has been a recurrent theme in public debate for about 150 years. But in 1966 the Government announced its decision to adopt a decimal currency system in February 1971. The advantage of this change is that it will be easier for the public and also commerce and industry to reckon in decimal units than in terms of £. *s*. *d*.

Two main alternative forms of decimalisation were considered: either to make 10*s*. the major unit, with division into 100 cents, or to retain the £ as the major unit to be subdivided. The Government decided on the latter course: the £ will remain the main unit of the British currency, but it will be divided into 100 *new pennies*, instead of into twenty shillings each of twelve pence. Since the new penny will be worth 2·4*d*., it will be necessary to have a *new halfpenny* as well. In making its choice the Government took the long view: the process of transition would be easier with the 10*s*. unit, and there would be no need for half-cents: but as incomes and prices rose over the years, 10*s*. would eventually be too small a unit.

After the new currency is introduced we shall have the following coins: ½ new penny (worth 1·2*d*.), 1 new penny (2·4*d*.), 2 new pence (4·8*d*.), 5 new pence (1*s*.), 10 new pence (2*s*.), 50 new pence (10*s*.). For a year or two both currencies will be used. The costs of decimalisation—the replacement of business machines, and administration—will be more than £100 million, but the benefits—in time and effort saved—will exceed this figure many times over in the long run.

GREEK MYTHS & LEGENDS

TABLE OF CONTENTS

GREEK MYTHS AND LEGENDS

PART I. INTRODUCTION

(a) The Significance of the Myths and Legends.

We all know how the stories and books that we knew in our youth have coloured our thought. So it is with the myths and legends of the earliest civilisation of Europe, that of the Greeks. Their stories have entered the stream of consciousness of European men and women through the ages, affecting their literature and art, and even their ways of thinking.

The Origin of Myths. True myth has been defined by Robert Graves as "the reduction to narrative shorthand of ritual mime performed on public festivals, and in many cases recorded pictorially." These rituals were, says Graves, "archaic magic-makings that promoted the fertility or stability of a sacred queendom or kingdom—queendoms having, it seems, preceded kingdoms throughout the Greek-speaking area."

The immense diversity of these myths is partly due to geographical causes, for, in the widely differing districts of Greece, different conceptions of the divinity and varying rituals of propitiation were evolved. There are also historical causes, for the Mediterranean peoples worshipping an earth goddess were conquered by successive waves of Hellenes bringing with them some form of tribal sky god.

Legends. Interwoven with the religious myths were a host of legends, traditional stories, which though not authentic had, like the tales of Troy, a substratum of fact. There were, also, all kinds of fables and anecdotes, folk-tales such as that of Perseus, and allegories and romances, which fused with the myths and legends to make a fascinating complex of stories.

Their Preservation in Literary Form. These have been preserved for us largely by the Greek poets, especially by Homer in his *Iliad* and *Odyssey*, and by Hesiod in his *Theogony*, works which probably date from about the eighth century B.C. The Greek dramatists of the fifth century B.C.—Aeschylus, Sophocles, and Euripides—who relied on myth and legend for most of their plots, also handed on the ancient tales, though often in slightly altered form. Then about five centuries later Roman writers, such as Virgil, Ovid and Horace, modelling themselves on the Greeks, refashioned and embroidered their themes. It is not surprising that we have so many variants of the same tale.

This rich and complex treasure of Greek myth and legend has become increasingly familiar in Western Europe, at first in Latin versions, then after the Renaissance in the original Greek, and today in excellent modern translations.

Their Significance Today. Because of their extraordinary vitality and pervasiveness, some familiarity with Greek myth and legend is almost indispensable to a full appreciation of our European culture.

In Art and Literature. Great painters like Botticelli, Veronese and Rubens made the ancient stories the subject of their pictures, and writers from Shakespeare to James Joyce have enriched their work by constant reference. The French dramatists from Racine to Giraudoux are notable for relying on them for the basic plot of their dramas. Today when good and inexpensive translations enable us to go direct to Homer's *Iliad*, or to see Euripides' *Medea* on the stage, it is especially useful to have some general knowledge of the mythical background to the particular epic or play.

Psychology. Not only to those who love art and literature is the knowledge of Greek mythology rewarding. Psychologists have found here suggestive symbols for the profound mental processes they are endeavouring to elucidate. Through Freud the term "Œdipus complex" is now a commonplace, and Jung has found in the myths symbolic archetypes of human response.

Philosophy and Religion. Philosophers also have found it profitable to return to the myths. Bertrand Russell emphasises the influence of Greek religion on Greek philosophy, and, through such philosophers as Pythagoras and Plato, on Christianity itself.

Anthropology. Of recent years anthropologists scrutinising the myths have been able to discern something of the way of life of primitive societies. The two-volume Penguin *The Greek Myths*, by Robert Graves, incorporates some of their interpretations.

Archæology. Perhaps the most exciting of all recent investigations are those of the archæologists working on sites once considered only legendary. The German Schliemann, trusting to the fidelity of his Homer, actually unearthed the foundations of Priam's Troy and Agamemnon's Mycenæ, finding fabulous treasure and proving to the astonished world that these antique tales were indeed rooted in fact. Through Schliemann's trust in Homer we have added an early chapter to History, that of the Mycenæan culture of pre-classical Greek which flourished from about 1550 to 1200 B.C.

Another centre of ancient story, the island of Crete, was the field of Sir Arthur Evans' enquiries, and his excavation of the magnificent Palace of Cnossos not only pushed back the frontiers of history yet further to about 3000 B.C., but also showed how many Cretan legends had some factual basis.

More recent excavations at legendary Mycenæan sites on the mainland have led to the discovery of the Palace of Nestor at Pylos, and the House of Cadmus at Thebes.

Tablets found at Mycenæan towns and in Cnossos inscribed in an entirely unknown script, "Linear B," have challenged scholars with a fascinating puzzle. After years of study Michael Vertris and others have at last been able to decipher the script. Although so far only inventories are available, it is significant that the language used is archaic Greek. We now know therefore that the Greeks of the Mycenæan age could write, and that Homer's single reference to writing is once more a faithful record

of fact. (See Book VI of the *Iliad* and the reference to Bellerophon's "folded tablet.")

(b) The Historical Background to the Myths and Legends.

Our knowledge of the earliest periods of Greek history is very recent. The great historian Grote, writing in 1846, said that we must consider the First Olympiad of 776 B.C. as the starting point. Anything earlier was matter for conjecture. It is largely due to the discoveries of archæologists that scholars are now able to push back the frontiers of history. From archæological evidence they can now reconstruct the probable course of events from as early a date as 3000 B.C.

3000 B.C. Early Bronze Age. It was about 3000 B.C., when the Neolithic Age was succeeded in the Eastern Mediterranean by the Early Bronze Age, that a bronze-using people, akin to those of early Crete and the Cyclades, entered Greece and fused with the Neolithic folk already there. These invaders were not Aryans, but of Mediterranean stock, and they worshipped the Great Goddess, a fertility goddess who appeared in many guises. She was unmarried, and in many instances her lover appeared to her in the form of a bird.

2000 B.C. Coming of Hellenes. A thousand years later, in the Middle Bronze Age a very different kind of people began to enter Greece. These were the Hellenes or Greeks, an Aryan people from the North, for whom transport and conquest were easy by reason of their horses and wheeled vehicles. Unlike their predecessors, they were patriarchal, and their chief divinity was a tribal sky-god, but as they fused with the pre-Hellenic stock already in the country, so their patriarchal worship mingled with the matriarchal and the sky-god married the earth-goddess.

Minyans and Ionians. Successive waves of these Hellenes invaded the country in three main groups beginning in about 2000 B.C. with Minyans and Ionians.

Minoan Culture. Penetrating far south to the islands, and to Sicily, Southern Italy, and Asia Minor, they became expert navigators. They were much influenced by a brilliant and sophisticated Minoan culture already flourishing in Cnossos in Crete, and this began to have considerable effect on the mainland of Greece from about 1580 B.C. onwards.

1400 B.C. Achæans. In about 1400 B.C., however, Cnossos fell, destroyed either by earthquakes or by invaders, for the Achæans, the second wave of Hellenes, had now begun to enter Greece, and from about 1400 to 1100 B.C. Mycenæ on the mainland was probably the centre of civilisation in the Ægean world.

Mycenæan Culture. It is this Mycenæan culture of the Late Bronze Age which, seen through legend, is depicted in Homer's *Iliad* and *Odyssey*. Mycenæ is Agamemnon's own citadel, and other cities where archæological remains are now being found are named in the *Iliad's* "Catalogue of Ships." The Achæans as Homer shows them were a conquering feudal aristocracy and a concerted attempt probably made by them in the beginning of the twelfth century B.C. to seize the Black Sea trade may be reflected in the epic of the siege of Troy.

1200 B.C. Dorians. But the Achæans themselves were soon to be defeated, for at the end of the twelfth century B.C. the last influx of invading Hellenes, the Dorians, ancestors of the classical Greeks, entered the country. They practically destroyed the Mycenæan civilisation, and the Late Bronze Age now gave way to the Iron Age.

The Olympian Divinities. The close fusion between the early non-Aryan Mediterranean people, with their matriarchal culture, and the successive waves of patriarchal Hellenes was reflected in the Greek worship of Olympians. The ancient earth-goddess of fertility lived on in such guises as Aphrodite or Hera, and Zeus, sky-god of the Hellenes, appropriately took Hera to wife. Indeed, many deities, such as Demeter or Athene, combined, in the single divinity, both Mediterranean and Hellenic traits.

A third element in Greek Olympian religion derived from a Hittite culture flourishing in Asia Minor in about 1300 B.C. which had developed from a Hurrian culture of about 1500 B.C. Hesiod writing in about 750 B.C., incorporated some violent Hurrian myths of the cannibalism of the gods, in his *Theogony* or *Birth of the Gods*.

The "Epic Cycle." By the eighth century B.C. there was in existence a rich store of myth and legend known as the "Epic Cycle," which was drawn on by Homer and also by later poets and dramatists.

Homer's Picture. Homer, whose epics were probably completed at the end of the eighth or in the seventh century B.C. presents the composite myth and legend of Greece in highly civilised form, as the beliefs of a successful war-like aristocracy. The twelve deities dwelling on Olympus acknowledged the supremacy of Zeus, and Dionysus the god of wine and ecstasy who entered from Thrace in the eighth century B.C. was still an outsider, a god of the lower orders.

The Coming of Dionysus. But by the fifth century B.C. Dionysus had been accepted as an Olympian, taking the place of Hestia. The growing popularity of his worship which induced an ecstatic union with the god in a frenzy partly stimulated by wine, partly mystical, shows the need of the recently civilised Greeks for an impulsive religious expression which was not always satisfied by the prudent cults of the serene Olympians.

Orpheus. From the worship of Dionysus developed that of Orpheus, which aimed at mystic union with the god through enthusiasm wholly mystic, and through purification. The Orphics, believing in the transmigration of souls and an after life, had much influence on the Greek philosopher Pythagoras, and this influence was transmitted through Plato into Christianity itself.

The great influence of Greek religion on philosophy has only recently been recognised, and Bertrand Russell commends especially the study of John Burnet's *Early Greek Philosophy*, especially its second chapter, "Science and Religion."

(c) Bibliography.

There is no one book or Bible of Greek myths. Many versions exist, and in a short account it is not possible to record all variations. The reader is advised to consult the masterpieces of Greek literature now available in translation.

(d) Guide to Pronunciation and Spelling.

This Cyclopædia uses the long-established convention of spelling Greek names which is also used by such modern scholars as Robert Graves and E. V. Rieu.

It is helpful to remember that:—

"ch" and "c" are pronounced "k."
"œ" and "æ" are pronounced "ē," as in "see."
"eus" rhymes with "juice."

PART II. NARRATIVE OUTLINES

THE OLYMPIAN CREATION MYTHS, 1–22.

1. Uranus and Ge. The infinite and empty space which existed before creation was known as Chaos. The Earth, or Ge, sprang from Chaos, and herself gave birth to Uranus, the Heavens, and Pontus, the Sea. Ge then became, by Uranus, the mother of the hundred-handed giants, the Hecatoncheires or Centimani (Cottus, Briareus, also called Ægæon, and Gyes or Gyges); of the one-eyed Cyclopes (Brontes, Steropes and Arges); and of the twelve Titans. Greek writers give inconsistent lists of these Titans, but those most frequently mentioned are Cronus, Oceanus, Hyperion, and Iapetus, and the Titanesses Rhea, Themis, Tethys, and Mnemosyne.

2. Barbarous stories follow of Uranus' dealings with his descendants, and these have been influenced by myths from the Hittite culture which flourished in 1300 B.C. in Anatolia, or Asia Minor, and which probably embodied still earlier Babylonian material. These Hittite legends reached Greece through the Phœnicians, and Hesiod (eighth century B.C.), a poet whose family had recently come from Asia Minor incorporated them in his *Theogony*.

3. Revolt of Cronus. Uranus had thrown his rebellious sons the Cyclopes into Tartarus, in the Underworld, and Ge persuaded the Titans, with the exception of Oceanus, to rise against their father. She gave Cronus, the youngest, a flint sickle, and with this he unmanned Uranus. Drops from the wound falling upon Mother Earth, she bore the three Erinnyes or Eumenides, the furies Alecto, Tisiphone, and Megaera, and from drops that fell into the sea Aphrodite was born.

4. Uranus deposed, the Titans freed the Cyclopes, but Cronus, now supreme, consigned them again to Tartarus along with the Hundred-handed giants.

5. Cronus then married his sister Rhea, and mindful of the curse of Uranus and Ge, that he also would be deposed by his own son, he swallowed each of his children at birth.

6. Birth of Zeus. But when Zeus the youngest was born, Rhea gave Cronus a stone to swallow and saved Zeus, who, according to Minoan tradition, was brought up in the Dictæan cave in Crete. In 1900 the reputed "birth-cave" was explored by archæologists—probably the first men to enter for two thousand years, and there they found votive offerings to the god which may have been left there in the second millennium B.C. It was here that the Curetes, Rhea's priests, clashed their weapons to drown the cries of infant Zeus, while a goat, Amalthea, acted as his nurse, and was rewarded by being placed among the stars as Capricorn, while one of her horns became the Cornucopia or horn of plenty.

7. Zeus when of age was counselled by Metis, the daughter of Oceanus, and with Rhea's help gave to Cronus a potion which obliged him to disgorge first the stone and then his other children, Hestia, Demeter, Hera, Hades, and Poseidon. These now joined with Zeus in a contest against their father and the other Titans, who were led by Atlas.

8. War between Zeus and Titans. The war, known as the Titanomachia, was waged in Thessaly, and lasted ten years, until Ge promised Zeus victory if he would free the Cyclopes and the Hundred-handed giants from Tartarus.

9. The Cyclopes gave to Zeus a thunderbolt, to Hades a helmet of darkness, and to Poseidon a trident. Thus aided, the three brothers overcame Cronus, and the Hundred-handed giants stoned the other Titans, who were defeated and consigned either to an island in the West or to Tartarus, guarded by the Hundred-handed. Atlas was punished by being made to carry the sky on his shoulders, but the Titanesses were spared. The supersession of the old dynasty of Titans by the new order of gods is the theme of Keats' fine poem, *Hyperion*.

10. The Olympians. Zeus and his brothers now divided the government by lot. To Hades fell the Underworld, to Poseidon the sea, and to Zeus the sky, while the earth was common to all. Zeus, the greatest of the gods, lived on the lofty summit of Mt. Olympus between Macedonia and Thessaly, along with Poseidon and their sisters, Hestia, goddess of the hearth-fire, Demeter, goddess of agriculture, and Hera, who became the wife of Zeus. Seven other divinities, Aphrodite, Pallas Athene, Apollo, Artemis, Hephæstus, Ares, and Hermes were also numbered among the twelve great Olympians, and at a later date a new-comer, Dionysus, took the place of Hestia.

11. The Giants' Revolt. But the troubles of Zeus were not over. A post-Homeric story tells of the giants' revolt. Twenty-four giants with serpents' tails, sons of Ge, tried to avenge the imprisonment of their brothers the Titans by attacking Olympus. Led by Alcyoneus, they included Porphyrion, Ephialtes, Mimas, Pallas, Enceladus, and Polybutes. Only after terrible struggles in Olympus and on earth, were the giants defeated by the gods, who were helped by a magic herb of invulnerability found by Heracles, who always dealt the giants the final blow.

12. The story offered some explanation of huge bones found at Trapezus and volcanic fires at neighbouring Bathos and Cumæ, the reputed sites of the battles. The burial of Enceladus under Mt. Etna in Sicily, and of Polybutes under Nisyrus, likewise accounted for their volcanic nature. The inclusion of Heracles before his apotheosis indicates the late origin of the legend.

13. Ephialtes and Otus. Another version of the giants' revolt ascribes it to the gigantic Alœidæ, Ephialtes, and Otus, sons of Iphimedeia by Poseidon, but named after Alœus, whom their mother later married. At the age of nine Ephialtes and Otus first captured and imprisoned Ares, god of war, and then, vowing to outrage Hera and Artemis, they piled Mount Pelion on

of fact. (See Book VI of the *Iliad* and the reference to Bellerophon's "folded tablet.")

(b) The Historical Background to the Myths and Legends.

Our knowledge of the earliest periods of Greek history is very recent. The great historian Grote, writing in 1846, said that we must consider the First Olympiad of 776 B.C. as the starting point. Anything earlier was matter for conjecture. It is largely due to the discoveries of archæologists that scholars are now able to push back the frontiers of history. From archæological evidence they can now reconstruct the probable course of events from as early a date as 3000 B.C.

3000 B.C. Early Bronze Age. It was about 3000 B.C., when the Neolithic Age was succeeded in the Eastern Mediterranean by the Early Bronze Age, that a bronze-using people, akin to those of early Crete and the Cyclades, entered Greece and fused with the Neolithic folk already there. These invaders were not Aryans, but of Mediterranean stock, and they worshipped the Great Goddess, a fertility goddess who appeared in many guises. She was unmarried, and in many instances her lover appeared to her in the form of a bird.

2000 B.C. Coming of Hellenes. A thousand years later, in the Middle Bronze Age a very different kind of people began to enter Greece. These were the Hellenes or Greeks, an Aryan people from the North, for whom transport and conquest were easy by reason of their horses and wheeled vehicles. Unlike their predecessors, they were patriarchal, and their chief divinity was a tribal sky-god, but as they fused with the pre-Hellenic stock already in the country, so their patriarchal worship mingled with the matriarchal and the sky-god married the earth-goddess.

Minyans and Ionians. Successive waves of these Hellenes invaded the country in three main groups beginning in about 2000 B.C. with Minyans and Ionians.

Minoan Culture. Penetrating far south to the islands, and to Sicily, Southern Italy, and Asia Minor, they became expert navigators. They were much influenced by a brilliant and sophisticated Minoan culture already flourishing in Cnossos in Crete, and this began to have considerable effect on the mainland of Greece from about 1580 B.C. onwards.

1400 B.C. Achæans. In about 1400 B.C., however, Cnossos fell, destroyed either by earthquakes or by invaders, for the Achæans, the second wave of Hellenes, had now begun to enter Greece, and from about 1400 to 1100 B.C. Mycenæ on the mainland was probably the centre of civilisation in the Ægean world.

Mycenæan Culture. It is this Mycenæan culture of the Late Bronze Age which, seen through legend, is depicted in Homer's *Iliad* and *Odyssey*. Mycenæ is Agamemnon's own citadel, and other cities where archæological remains are now being found are named in the *Iliad's* "Catalogue of Ships." The Achæans as Homer shows them were a conquering feudal aristocracy and a concerted attempt probably made by them in the beginning of the twelfth century B.C. to seize the Black Sea trade may be reflected in the epic of the siege of Troy.

1200 B.C. Dorians. But the Achæans themselves were soon to be defeated, for at the end of the twelfth century B.C. the last influx of invading Hellenes, the Dorians, ancestors of the classical Greeks, entered the country. They practically destroyed the Mycenæan civilisation, and the Late Bronze Age now gave way to the Iron Age.

The Olympian Divinities. The close fusion between the early non-Aryan Mediterranean people, with their matriarchal culture, and the successive waves of patriarchal Hellenes was reflected in the Greek worship of Olympians. The ancient earth-goddess of fertility lived on in such guises as Aphrodite or Hera, and Zeus, sky-god of the Hellenes, appropriately took Hera to wife. Indeed, many deities, such as Demeter or Athene, combined, in the single divinity, both Mediterranean and Hellenic traits.

A third element in Greek Olympian religion derived from a Hittite culture flourishing in Asia Minor in about 1300 B.C. which had developed from a Hurrian culture of about 1500 B.C. Hesiod writing in about 750 B.C., incorporated some violent Hurrian myths of the cannibalism of the gods, in his *Theogony* or *Birth of the Gods*.

The "Epic Cycle." By the eighth century B.C. there was in existence a rich store of myth and legend known as the "Epic Cycle," which was drawn on by Homer and also by later poets and dramatists.

Homer's Picture. Homer, whose epics were probably completed at the end of the eighth or in the seventh century B.C. presents the composite myth and legend of Greece in highly civilised form, as the beliefs of a successful war-like aristocracy. The twelve deities dwelling on Olympus acknowledged the supremacy of Zeus, and Dionysus the god of wine and ecstasy who entered from Thrace in the eighth century B.C. was still an outsider, a god of the lower orders.

The Coming of Dionysus. But by the fifth century B.C. Dionysus had been accepted as an Olympian, taking the place of Hestia. The growing popularity of his worship which induced an ecstatic union with the god in a frenzy partly stimulated by wine, partly mystical, shows the need of the recently civilised Greeks for an impulsive religious expression which was not always satisfied by the prudent cults of the serene Olympians.

Orpheus. From the worship of Dionysus developed that of Orpheus, which aimed at mystic union with the god through enthusiasm wholly mystic, and through purification. The Orphics, believing in the transmigration of souls and an after life, had much influence on the Greek philosopher Pythagoras, and this influence was transmitted through Plato into Christianity itself.

The great influence of Greek religion on philosophy has only recently been recognised, and Bertrand Russell commends especially the study of John Burnet's *Early Greek Philosophy*, especially its second chapter, "Science and Religion."

PART II. NARRATIVE OUTLINES

THE OLYMPIAN CREATION MYTHS, 1–22.

1. Uranus and Ge. The infinite and empty space which existed before creation was known as Chaos. The Earth, or Ge, sprang from Chaos, and herself gave birth to Uranus, the Heavens, and Pontus, the Sea. Ge then became, by Uranus, the mother of the hundred-handed giants, the Hecatoncheires or Centimani (Cottus, Briareus, also called Ægæon, and Gyes or Gyges); of the one-eyed Cyclopes (Brontes, Steropes and Arges); and of the twelve Titans. Greek writers give inconsistent lists of these Titans, but those most frequently mentioned are Cronus, Oceanus, Hyperion, and Iapetus, and the Titanesses Rhea, Themis, Tethys, and Mnemosyne.

2. Barbarous stories follow of Uranus' dealings with his descendants, and these have been influenced by myths from the Hittite culture which flourished in 1300 B.C. in Anatolia, or Asia Minor, and which probably embodied still earlier Babylonian material. These Hittite legends reached Greece through the Phœnicians, and Hesiod (eighth century B.C.), a poet whose family had recently come from Asia Minor incorporated them in his *Theogony*.

3. Revolt of Cronus. Uranus had thrown his rebellious sons the Cyclopes into Tartarus, in the Underworld, and Ge persuaded the Titans, with the exception of Oceanus, to rise against their father. She gave Cronus, the youngest, a flint sickle, and with this he unmanned Uranus. Drops from the wound falling upon Mother Earth, she bore the three Erinnyes or Eumenides, the furies Alecto, Tisiphone, and Megaera, and from drops that fell into the sea Aphrodite was born.

4. Uranus deposed, the Titans freed the Cyclopes, but Cronus, now supreme, consigned them again to Tartarus along with the Hundred-handed giants.

5. Cronus then married his sister Rhea, and mindful of the curse of Uranus and Ge, that he also would be deposed by his own son, he swallowed each of his children at birth.

6. Birth of Zeus. But when Zeus the youngest was born, Rhea gave Cronus a stone to swallow and saved Zeus, who, according to Minoan tradition, was brought up in the Dictæan cave in Crete. In 1900 the reputed "birth-cave" was explored by archæologists—probably the first men to enter for two thousand years, and there they found votive offerings to the god which may have been left there in the second millennium B.C. It was here that the Curetes, Rhea's priests, clashed their weapons to drown the cries of infant Zeus, while a goat, Amalthea, acted as his nurse, and was rewarded by being placed among the stars as Capricorn, while one of her horns became the Cornucopia or horn of plenty.

7. Zeus when of age was counselled by Metis, the daughter of Oceanus, and with Rhea's help gave to Cronus a potion which obliged him to disgorge first the stone and then his other children, Hestia, Demeter, Hera, Hades, and Poseidon. These now joined with Zeus in a contest against their father and the other Titans, who were led by Atlas.

8. War between Zeus and Titans. The war, known as the Titanomachia, was waged in Thessaly, and lasted ten years, until Ge promised Zeus victory if he would free the Cyclopes and the Hundred-handed giants from Tartarus.

9. The Cyclopes gave to Zeus a thunderbolt, to Hades a helmet of darkness, and to Poseidon a trident. Thus aided, the three brothers overcame Cronus, and the Hundred-handed giants stoned the other Titans, who were defeated and consigned either to an island in the West or to Tartarus, guarded by the Hundred-handed. Atlas was punished by being made to carry the sky on his shoulders, but the Titanesses were spared. The supersession of the old dynasty of Titans by the new order of gods is the theme of Keats' fine poem, *Hyperion*.

10. The Olympians. Zeus and his brothers now divided the government by lot. To Hades fell the Underworld, to Poseidon the sea, and to Zeus the sky, while the earth was common to all. Zeus, the greatest of the gods, lived on the lofty summit of Mt. Olympus between Macedonia and Thessaly, along with Poseidon and their sisters, Hestia, goddess of the hearth-fire, Demeter, goddess of agriculture, and Hera, who became the wife of Zeus. Seven other divinities, Aphrodite, Pallas Athene, Apollo, Artemis, Hephæstus, Ares, and Hermes were also numbered among the twelve great Olympians, and at a later date a new-comer, Dionysus, took the place of Hestia.

11. The Giants' Revolt. But the troubles of Zeus were not over. A post-Homeric story tells of the giants' revolt. Twenty-four giants with serpents' tails, sons of Ge, tried to avenge the imprisonment of their brothers the Titans by attacking Olympus. Led by Alcyoneus, they included Porphyrion, Ephialtes, Mimas, Pallas, Enceladus, and Polybutes. Only after terrible struggles in Olympus and on earth, were the giants defeated by the gods, who were helped by a magic herb of invulnerability found by Heracles, who always dealt the giants the final blow.

12. The story offered some explanation of huge bones found at Trapezus and volcanic fires at neighbouring Bathos and Cumæ, the reputed sites of the battles. The burial of Enceladus under Mt. Etna in Sicily, and of Polybutes under Nisyrus, likewise accounted for their volcanic nature. The inclusion of Heracles before his apotheosis indicates the late origin of the legend.

13. Ephialtes and Otus. Another version of the giants' revolt ascribes it to the gigantic Alœidæ, Ephialtes, and Otus, sons of Iphimedeia by Poseidon, but named after Alœus, whom their mother later married. At the age of nine Ephialtes and Otus first captured and imprisoned Ares, god of war, and then, vowing to outrage Hera and Artemis, they piled Mount Pelion on

Ossa in their attack on Heaven. Artemis induced them to go to the island of Naxos in the hope of meeting her, but disguised as a doe she leapt between them and they killed each other in error. Hermes then released Ares, and the spirits of the Alceidæ were tied with vipers back to back to a pillar in Tartarus.

14. Typhon. After the destruction of the giants, Ge in revenge brought forth the gigantic monster Typhon, fathered on her by her own son Tartarus. His huge limbs ended in serpents' heads and his eyes breathed fire. When he approached Olympus the gods in terror fled to Egypt disguised as animals, Zeus as a ram, Apollo a crow, Dionysus a goat, Hera a white cow, Artemis a cat, Aphrodite a fish, Ares a boar and Hermes an ibis. Athene alone was undaunted and persuaded Zeus to attack Typhon. After a fearful struggle, in which Zeus was temporarily incapacitated and only rescued by Hermes and Pan, he destroyed Typhon with his thunderbolts and buried him under Mt. Ætna, which still breathes fire.

15. The flight of the gods to Egypt serves to explain the Egyptian worship of them in animal form.

16. Prometheus and Epimetheus. The creation of mankind is often ascribed to Prometheus, whose name signifies "forethought," as that of his brother, Epimetheus, means "afterthought." These two, unlike their brother Atlas, had supported Zeus during the war with the Titans. But Prometheus, the clever benefactor of mankind, by stealing fire from Olympus and giving it to humans, brought upon himself divine vengeance.

17. The infuriated Zeus ordered Hephæstus to make a lovely woman, Pandora, the Eve of Greek myth, who was endowed by the gods with baleful powers and taken by Hermes to Epimetheus. When he had married her, she opened a box from which escaped all ills which plague mankind.

18. Zeus punished Prometheus by chaining him to a crag in the Caucasus, where all day long an eagle tore at his liver, which grew whole again during the night. Only after many generations did Heracles, with the consent of Zeus, shoot the eagle and free the heroic rebel.

19. The agony of Prometheus is the theme of Æschylus' tragedy *Prometheus Bound*; the liberator is depicted in his lost drama, *Prometheus Unbound*. Shelley's dramatic poem of the same name takes Prometheus as a symbol of those who challenge tyranny for the sake of mankind.

20. Deucalion and Pyrrha. Deucalion, the son of Prometheus, is the Noah of Greek myth. When Zeus decided to wipe out mankind by releasing a great flood on earth, Deucalion, warned by his father, made an ark which saved both himself and his wife Pyrrha, daughter of Epimetheus. After nine days the flood subsided and the ark came to rest on Mt. Parnassus.

21. Deucalion and Pyrrha then earnestly prayed at the shrine of Themis that the earth might be re-peopled. Themis appeared and commanded them to throw the bones of their mother behind them. They interpreted this as meaning the rocks of mother earth and those flung by Deucalion became men, those thrown by Pyrrha women.

22. Their son, Hellen, was the mythical ancestor of all the Hellenes.

THE OLYMPIAN DEITIES, 23–128.

ZEUS, 23–28.

23. Zeus, identified with Jupiter by the Romans, was the greatest of the Olympian divinities, omnipotent king of gods, father of men, and possibly master even of fate. Legends of his origin and supremacy are told in para. 6–20.

24. Zeus was the bright god of the sky, whom the invading Achæans introduced into Greece in about 1200 B.C., together with his consort Dione. Her worship, however, did not penetrate south of Zeus' shrine at Dodona in Epirus, where the rustling of oak leaves was interpreted as the voice of the god, and Zeus found other wives. His Olympian consort was Hera, who was in origin the Great Goddess of the pre-Hellenic matriarchal society. This marriage symbolises the fusion of the Achæans with their predecessors.

25. He first married Metis, daughter of Oceanus and Tethys, but when she was pregnant with Athene he swallowed her and brought forth Athene from his head. His second wife was Themis, daughter of Uranus and Ge, a divinity representing order, and their children were the Horæ and the Mœræ, or Fates, though some say that the Fates were daughters of Erebus and Night, and that even Zeus was subject to them. To Zeus and Hera were born the deities Ares, Hebe, and Hephæstus, unless the latter was the parthenogenous son of Hera. Zeus was also the father of Persephone by his sister Demeter, of the Charities, or Graces, by Eurynome, and of the Muses by Mnemosyne.

26. By mortal women four Olympian deities were children of Zeus; Hermes the son of Maia, Apollo and Artemis the children of Leto, and Dionysus the son of Semele. Zeus loved many mortal women, and Hera was intensely jealous and revengeful towards them and their children.

27. Although Zeus' earliest oracle was at Dodona, he was said to dwell with his fellow divinities on the summit of Olympus in Thessaly, and was also worshipped at Olympia in Elis. The Greeks dated their era from the first festival of the Olympiad in 776 B.C.

28. Zeus alone used the thunderbolt and was called the thunderer. The oak, the eagle, and mountain summits were sacred to him, and his sacrifices were usually bulls, cows, and goats. His attributes were the sceptre thunderbolt, eagle, and a figure of Victory held in his hand. The Dodonean Zeus sometimes wore a wreath of oak leaves, the Olympian Zeus one of olive.

HERA, 29–35.

29. Hera, identified by the Romans with Juno, was the Great Goddess of the pre-Hellenic matriarchal society, whom Zeus, supreme god of the Achæans, appropriately took to wife.

30. She was said to be a daughter of Cronus and Rhea and reluctantly married her brother Zeus, who in the form of a cuckoo sought her out at Cnossos in Crete, or perhaps in Argos, and their wedding night was spent on Samos. Ge gave Hera the tree with the golden apples later guarded by the Hesperides.

31. Though Hera was treated with reverence by the gods, she was greatly inferior in power to Zeus and must obey him, her subordination reflecting the attitude of the Achæans towards women. Only in her power to bestow the gift of prophecy was Hera equal to her husband.

32. She was often rebellious and jealous of Zeus' intrigues and persecuted his children by mortal women. At one time, with Poseidon and Apollo, she led a conspiracy of all the Olympians save Hestia to put Zeus in chains. He was freed by Thetis and Briareus, and punished Hera by hanging her with wrists chained to the sky and an anvil on each ankle.

33. Hera bore Zeus Ares and Hebe and annually renewed her virginity by bathing in a spring near Argos. As properly speaking, the only married goddess among the Olympians, she was worshipped

as goddess of marriage and the birth of children, the Ilithyiæ being her daughters.

34. Hera was of majestic stature, and her attributes were a diadem, veil, sceptre, and peacock. Samos and Argos were seats of her worship.

35. Because of the judgment of Paris she was relentlessly hostile to the Trojans.

HESTIA, 36–37.

36. Hestia, called Vesta by the Romans, and the eldest sister of Zeus, was a divinity brought to Greece by the invading Achæans. Though Poseidon and Apollo both sought her love, she swore by Zeus always to remain a virgin.

37. She was goddess of the fire on the hearth, supremely important in those days because so difficult to rekindle, and was naturally thought of as goddess of home life. Each town or city had its sacred hearth, which, like that of the home, was an asylum for suppliants. The first part of all sacrifices offered to the gods was due to Hestia, the most peaceable and kindly of all the Olympians, but at a later date Dionysus took her place among the twelve Olympian gods.

ATHENE, 38–45.

38. Athene, whom the Romans identified with Minerva, was the embodiment of wisdom and power.

39. The Achæans brought with them a young warrior goddess, who bore the titles, Kore, Parthenos, Pallas, meaning girl, virgin, maiden, and she was in about 1700 B.C. identified with an older pre-Hellenic "Palace Goddess," worshipped in Crete. The "Palace Goddess" was one aspect of the Great Goddess, revered not for motherhood but for feminine intuition, and from pre-Hellenic times comes the name Athene.

40. The complex Pallas Athene was thus not only the patroness of women's arts such as weaving, protectress of agriculture, inventor of plough, rake, and ox-yoke, but also a warrior, a wise tactician, appearing in armour and wearing on her ægis or shield the head of Medusa, during the Trojan War the great protagonist of the Greeks. Legends of the birth of Pallas Athene reveal how the patriarchal Hellenes took over, and made their own a matriarchal divinity.

41. She was said to be a daughter of Zeus and Metis, but before her birth an oracle had foretold that she would be a girl, and that if Metis had another child it would be a son who would depose his father. Zeus therefore swallowed Metis, and later, suffered an agonising headache as he walked by Lake Triton. Hermes realising the cause, persuaded Hephæstus, or, according to some, Prometheus, to cleave open Zeus' skull, from which Athene sprang completely armed.

42. The centre of her cult was Attica and Athens, and legend said that when Athene and Poseidon contended for the possession of the city, the gods judged it should belong to Athene, who in planting the olive-tree had conferred the better gift.

43. Preferring to settle quarrels peaceably, Athene established here the court of the Areopagus, where if votes were equal, she herself gave a casting vote to free the accused, as in the trial of Orestes.

44. In 566 B.C. Pesistratus founded the great Panathenaic festival, celebrated every fourth year, and its magnificent procession was represented on the frieze of the Parthenon now in the British Museum, while the birth of Athene was represented in the gable at the east end of the Parthenon, and the contest with Poseidon at the west. Pesistratus also introduced a new coinage, with the head of Athene on one side, and the owl, her bird, upon the other.

45. Other pre-Hellenic acropolipses were sacred to Athene, and her worship flourished in Sparta, Corinth, Argos, and Thebes.

HEPHÆSTUS, 46–56.

46. Hephæstus, identified with Vulcan by the Romans, was the smith-god, a superb artist in metals.

47. He probably originated as a pre-Hellenic fire-god near the Mt. Olympus of Lycia in Asia Minor, where gaseous vapour, seeping through the soil, ignited. The Lycians emigrated to Lemnos, where they became known as Pelasgians, and again found fire issuing from the earth, and this fire became the symbol of their god Hephæstus.

48. The cult of Hephæstus spread to Athens, where his artistic genius was so venerated that in the frieze of the Parthenon where two pairs of gods are given positions of honour, Zeus appears with Hera, and Hephæstus with Athene.

49. In Homer's time Hephæstus was one of the twelve Olympians, his exalted position reflecting the importance of the smith in a Bronze Age society when weapons and tools had magical properties. He is, like other smith-gods, represented as lame, possibly because the tribe deliberately lamed their smith to prevent his running away, possibly because work at the forge developed muscular arms but feeble legs.

50. According to Homer, Hephæstus was the son of Zeus and Hera, though later tradition says that he was son of the goddess alone, just as his fire sprang mysteriously from the earth.

51. Born lame and weak, Hephæstus was so much disliked by Hera that she threw him from Olympus, when he fell into the sea and was cared for by the sea-goddesses Thetis and Eurynome in a grotto under the sea.

52. After nine years Hera took him back to Olympus, where he had a fire smithy, but on one occasion he enraged Zeus by taking Hera's part, so that he was again flung from Olympus, this time by Zeus. He was a day falling, and alighted in the evening on the island of Lemnos, as described in *Paradise Lost*, Book I, lines 740–746. Later writers diverge from Homer in making this second fall the cause of Hephæstus' lameness.

53. He again returned to Olympus and acted as mediator between Zeus and Hera, though the gods laughed at him as he hobbled about.

54. His workshop in Olympus was in his own palace, and all the palaces of the gods were made by him He also made the magnificent armour of Achilles, as is described in the eighteenth book of the *Iliad*, the necklace of Harmonia, and the bulls of Æëtes. Later accounts place his workshop on the volcanic island of Sicily, where the Cyclopes served him.

55. In the *Iliad*, Hephæstus' wife was Charis, but in the *Odyssey* she was Aphrodite, who was unfaithful to him with Ares. How Hephæstus caught the two together in an invisible net he had made, and exposed them to the ridicule of the gods, is told in a poem known as the "Lay of Demodocus," incorporated in the eighth book of the *Odyssey*.

56. Hephæstus' favourite spots on earth were Lemnos, and volcanic islands like Lipara, Hiera, Imbros, and Sicily. In Greek art he is represented as a vigorous man with a beard, carrying a hammer or similar instrument, and wearing an oval cap or chiton.

APHRODITE, 57–63.

57. Aphrodite, goddess of desire, identified by the Romans with Venus, was derived from the Great Goddess of pre-Hellenic times, her counter-

parts being the orgiastic Ishtar of Babylon and Astarte of Syria.

58. She was worshipped as a fertility goddess at Paphos in Cyprus, whence Phœnicians took her worship to Cythera, an island off Southern Peloponnesus. Probably as late as the eighth century B.C. her fertility cult was established on Acrocorinthus above Corinth. There was a similar sanctuary on Mt. Eryx in Western Sicily. In these places the goddess was served by young girls, but in other Greek states her worship was more that of protectress of the city.

59. According to Hesiod, Aphrodite sprang from the seed of Uranus and rose naked from the sea, as in Botticelli's picture "The Birth of Venus." Rising near the island of Cythera, she passed to Paphos in Cyprus.

60. Homer makes Aphrodite the daughter of Zeus and Dione, and represents her as wife to Hephæstus. She was, however, unfaithful to him and in love with Ares. The amusing situation when they were caught together is described in para. 55. Harmonia was one of their children.

61. Aphrodite also bore sons to Poseidon, and Priapus to Dionysus, and later stories tell that she bore Hermaphroditus to Hermes, and Eros to either Hermes, Ares, or Zeus.

62. Her love for the mortal Adonis is the theme of Shakespeare's *Venus and Adonis*, and one of the Homeric hymns tells of her passion for Anchises, cousin of Priam, to whom she bore Æneas, the hero of Virgil's *Epic*. Unfortunately Anchises, boasting of Aphrodite's love, was struck by Zeus with a thunderbolt.

63. Aphrodite possessed a magic girdle which made the wearer irresistibly lovely and desirable. Doves and sparrows were sacred to her. Her most beautiful statue was that of Praxitiles in the fourth century B.C., a copy of which is preserved in the Vatican. The Venus de Milo may be seen in the Louvre.

ARES, 64–67.

64. Ares, god of war, who was identified by the Romans with Mars, was a divinity of Thracian origin, whose worship spread through Macedonia to Thebes, Athens, and cities of the Peloponnesus, especially Sparta. Ares was, however, not popular with the Greeks, who disliked purposeless war and despised the Thracians for enjoying it, and their attitude is reflected in the myths of Ares.

65. He was the son of Zeus and Hera, and as he delighted in battle for its own sake he was hated by the other gods, except Eris, Hades, and Aphrodite, who was in love with Ares and he with her. The two were once trapped together in a net which Hephæstus had engineered, as is described in para. 55.

66. Ares was not always successful in battle. The Alcidæ conquered him and left him imprisoned in a brazen vessel for thirteen months, until he was released by Hermes. Athene twice vanquished him, and Heracles also defeated him and forced him to return to Olympus.

67. According to a late tradition, Ares once defended himself before the gods in a trial where he was accused of murdering Halirrhothius, son of Poseidon. Since he pleaded that he had saved his daughter, Alcippe, from being violated, Ares was acquitted, and the place of the trial became known as the Areopagus.

APOLLO, 68–80.

68. Apollo's worship probably derived from two sources, from the Dorians, who in about 1100 B.C. entered Greece and reached as far south as Crete, and from Ionians, living in the islands and mainland of Anatolia, or Asia Minor, who became acquainted with a Hittite divinity worshipped in Lycia, and hence called Lycius.

69. Apollo's Dorian shrine was at Delphi, near the Castalian spring on Mt. Parnassus, where he was called the Pythian, or Loxias, the Ambiguous. His Ionian shrine was at Delos, where he was called Lycius, and Phæbus, or Shining, and where he was more closely associated with his twin-sister, Artemis.

70. Legends said that Apollo and Artemis were the children of Zeus and Leto, but before their birth, jealous Hera caused Leto to wander from place to place till she gave birth to Artemis under a palm-tree at Ortygia, and to Apollo beside a palm in the isle of Delos.

71. This story is told in the Delian Homeric Hymn of 700 B.C., while the Delphic Hymn tells how Apollo, soon after his birth, sought out the she-dragon Python, on Mt. Parnassus, and there killed her, taking over the Oracle of Earth at Delphi, where his priestess the Pythoness became the mouthpiece of his oracles, which were imparted in hexameter verse. Apollo was commanded by Zeus to visit the Vale of Tempe for purification, and to preside over the Pythian games held in Python's honour.

72. Hera, still implacable, sent the giant Tityus to violate Leto, as she came with Artemis to Delphi, though some say that it was Artemis who was attacked, but the giant was killed by the arrows of Apollo and Artemis.

73. Apollo was not always subservient to Zeus. He once, with Hera, Poseidon, and other Olympians, bound Zeus with chains and was punished by being sent with Poseidon as bondman to King Laomedan, where by playing the lyre and tending the flocks he helped Poseidon to build the walls of Troy. On another occasion, furious that Zeus had slain his son Asclepius, Apollo retaliated by killing the Cyclopes. Zeus now sent him to serve King Admetus of Pheræ in Thessaly, and again he kept flocks. He also helped Admetus to win his bride Alcestis and even ensured that the king should be restored to life if one of his family would die in his stead.

74. Apollo loved many mortal women, including Cyrene, mother of Aristæus, Coronis, mother of Asclepius, the healer, and Aria, mother of Miletus. The nymph Dryope was also seduced by Apollo, but when he pursued the nymph Daphne she cried for help and was turned into a laurel, henceforth Apollo's tree; and the nymph Marpessa preferred his rival, Idas. Apollo loved Cassandra, daughter of Priam, and conferred on her the gift of prophecy, but, when she disappointed him, decreed that she should never be believed. Hyacinthus, a Spartan prince, in origin an earth deity, was beloved by Apollo, and when he was killed by the god's jealous rival, Zephyrus, the hyacinth flower sprang from his blood.

75. Apollo had varied characteristics. He was destroyer, as his arrows indicated, and sudden deaths were ascribed to him. It was he who sent plagues among the Greeks besieging Troy. But he was also protector, warding off evil, as his fatherhood of Asclepius indicated. He protected flocks and cattle, as his service to Laomedan and Admetus showed, and later writers particularly stressed this aspect.

76. As god of prophecy, Apollo could communicate the gift to gods and mortals, and of all the centres of his worship Delphi was the most famous. The shrine had probably been established by pre-Hellenic people, worshipping Mother Earth, and had been seized by invading Hellenes who killed Python the oracular serpent, took over the oracles in the name of their own Apollo, and held funeral games in honour of Python to placate the original inhabitants. The shrine was supposed to contain the Omphalos, or navel stone of earth, and a chasm which occasionally gave out intoxicating vapours. Over this Apollo's priestess, Pythia, sat on a tripod, and uttered his oracle after chewing intoxicating laurel leaf. She was regarded as the mystical bride of the god.

77. As god of song and music Apollo appears in the *Iliad* delighting immortals. He was said to have received the lyre from Hermes, and its seven strings were connected with the seven Greek vowels. In music none surpassed Apollo, not even Pan, nor Marsyas, the satyr who had found Athene's discarded flute which played by itself. Defeated in a contest, Marsyas was flayed alive by the victorious god. Apollo, as leader of the Muses, was called Musagetes. He valued order and moderation in all things, his favourite maxims being "Nothing in Excess," and "Know thyself."

78. Apollo also delighted in the foundation of towns, and his oracle was always consulted before a town was founded.

79. In later writers he was identified with the sun god, the result of Egyptian influence, for in Homer, Helios, god of the sun, is completely distinct from Apollo.

80. The worship of Apollo, typical of all that is most radiant in the Greek mind, has no counterpart in the religion of Rome. Not till the end of the third century B.C. did the Romans adopt his religion from the Greeks.

ARTEMIS, 81–89.

81. Artemis, whose Roman counterpart was Diana, had two chief aspects. One was as "Mistress of Animals," a goddess of the chase, worshipped in primitive matriarchal society, and probably owing something to the Britomartis and Dictynna, worshipped as huntresses in Crete. The other, originating in Asia Minor, was of the age-old mother-goddess, and is most clearly seen in Artemis Ephesia, who was worshipped as an orgiastic goddess.

82. Legends of the birth of Artemis are told in the story of Apollo, and as his sister she shared many of his characteristics. She carried bow and arrows, made for her by Hephæstus, and had power to send plague and sudden death, as when she and Apollo killed the children of Niobe. She was also protectress of children and young animals and goddess of the chase.

83. Like Apollo, Artemis was unmarried, and later writers stressed that she was a maiden goddess and severely punished any lapses. She changed Actæon to a stag to be torn to pieces by his own hounds, only because he had seen her bathing, and some traditions say that she killed Orion because of his unchastity. The nymph Callisto, who had been seduced by Zeus, was in the form of a bear hunted down by the hounds of Artemis.

84. When Apollo was identified with the Sun, Artemis was identified with Selene, the Moon.

85. The Arcadian Artemis, early worshipped in Arcadia as a huntress among the nymphs, was unconnected with Apollo.

86. Another aspect of the goddess was as the fierce Artemis of Tauris, to whom all strangers were sacrificed. Iphigeneia was once her priestess, and she and Orestes took her image to Brauron in Attica, whence the goddess was called Brauronia. This Brauronian Artemis was worshipped in Athens, and also in Sparta, where boys were scourged at her altar until they sprinkled it with their blood.

87. Artemis as an orgiastic goddess had her chief centre in Ephesus, with its immensely wealthy temple, and it was this Artemis that St. Paul encountered. (See Acts of the Apostles, Ch. XIX.)

88. Though usually regarded as a rural divinity, Artemis was supreme in three great cities, in Ephesus, in Marseilles, to which Ionian Greeks from Asia Minor took her cult between 600 and 540 B.C., and in Syracuse, where she was known as Artemis Arethusa.

89. The goddess was often portrayed as a huntress, as in the so-called Diana of Versailles, now in the Louvre. As huntress her chlamys reached only to the knees, and she carried a bow, quiver, and arrows, or a spear, and was accompanied with stags or dogs. As Selene, she wore a long robe and veil, and a crescent moon on her forehead.

HERMES, 90–98.

90. Hermes, whom the Romans called Mercurius, was originally one of the gods of the pre-Hellenic people, the divinity dwelling in the cairn, or "herma," set up by shepherds as a landmark in wild country, and so developing as a protector against predatory animals and a guide to travellers. This Hermes was identified with a similar divinity worshipped in Minoan Crete, a "Master of Animals," a son or lover of the Great Goddess, and therefore a god of fertility.

91. Legends said that Hermes was the son of Zeus and Maia, an embodiment of the Great Goddess, and a daughter of Atlas, whence Hermes' name Atlantiades.

92. The "Hymn to Hermes" of 600 B.C. tells that he was born in a cavern on Mt. Cyllene in Arcadia (from which he was sometimes called Cyllenius), and that he grew with amazing rapidity. When only a few hours old he went to Pieria and stole some of the oxen of Apollo, which he drove to Pylos, and then, returning to Cyllene, he invented the lyre by stringing a tortoise-shell with cow-gut. Apollo, on discovering the thief, accused him to Zeus, who ordered Hermes to restore the oxen. But when Apollo heard the lyre he was delighted, took it in exchange for the oxen, and became the friend of Hermes, leading him back to Zeus.

93. Zeus gave to Hermes supreme power over animals and appointed him his herald. Hermes also acted as herald to Hades, conducting shades to the underworld. (See Virgil's *Æneid*, Bk. IV, ll. 242 *sqq.*) As herald he was regarded as god of eloquence, whence St. Paul, "the chief speaker," was mistaken for him in Lystra of Asia Minor. (See Acts of the Apostles, Ch. XIV.) Heralds promote peace and therefore trade. Thus Hermes came to be looked on as god of peaceable commerce.

94. He was also god of prudence and cunning, and even of theft, and was said to have helped the Fates in composing the alphabet. Many inventions ascribed to Hermes, such as weights and measures, the musical scale, astronomy, olive-culture, and the arts of boxing and gymnastics, were pre-Hellenic, and the stories of his childhood may indicate how the Hellenes took over these arts in the name of their god Apollo. As a god of fertility and luck, Hermes presided over games of dice.

95. He played a part in such incidents as the rescue of Dionysus, the punishment of Ixion, the selling of Heracles to Omphale, the judgment of Paris, and the leading of Priam to Achilles, but his most famous exploit was perhaps the slaying of Argus, the hundred-eyed giant sent by Hera to watch Io.

96. Hermes had several sons, including Echion, herald to the Argonauts, Autolycus the thief, his son by Chione, and Daphnis.

97. His worship flourished in Arcadia, where he was to be found with Pan and the muses. It spread to Athens, and he became one of the best loved of the Olympians.

98. Hermes' attributes were the Petasus, a travelling-hat, in later time adorned with wings, the Alipes, or winged-sandals, and the Caduceus, or heralds' staff, whose white ribbons were later mistaken for serpents because he was herald to Hades. Sacred to Hermes were the tortoise, the palm-tree, the number four, and some kinds of fish, and his sacrifices were incense, honey, cakes, pigs, lambs, and kids.

POSEIDON, 99–109.

99. Poseidon, identified by the Romans with Neptune, derived from a god worshipped by the earliest Aryan invaders of Greece, the Minyans and Ionians, who entered the country in about 2000 B.C. It was with the aid of horses and wheeled vehicles that they quickly overcame any resistance, and their god Poseidon was often thought of as the horse whose hooves thunder on the earth. He is constantly spoken of in Homer as "earth-shaker," while many legends show him in equine guise. It is possible that he was originally thought of as a sky-god, a thunderer, and the mate of an earth-goddess who later developed as Demeter.

100. But when in about 1450 B.C., another wave of invading Aryans, the Achæans, entered Greece, they also brought their sky-god, a thunderer called Zeus, possibly in origin identical with Poseidon, and the latter, recognised as an older brother of Zeus, came to be revered as a sea-divinity, for the Minyans were, by now, expert in navigation.

101. According to legend, Poseidon was the eldest son of Cronus and Rhea, and when, after the deposition of Cronus, he and his brothers Zeus and Hades cast lots for sovereignty, the sea became Poseidon's share. He dwelt in an under-water palace near Ægæ in Eubœa, which is described in the beginning of the 13th book of the *Iliad*, and here he kept his horses with brazen hooves and golden manes, and when they drew his chariot over the sea it became tranquil.

102. He was said to have created the horse when disputing with Athene for the possession of Athens, and he taught men how to bridle horses. He was the protector of horse-races, and horse and chariot races were held in his honour on the Corinthian isthmus.

103. In the form of a horse he raped his sister Demeter, when she was disguised as a mare. Their offspring were the horse Arion and the nymph Despœna, and some say Persephone also, though according to another version Demeter was searching for Persephone, her daughter by Zeus, at the time of the rape.

104. Poseidon, though equal to Zeus in dignity, was less powerful and resented the pride of his younger brother. He once joined with Hera, Apollo, and other Olympians, to put Zeus in chains, and he and Apollo were punished by being sent as bondsmen to Laomedan. Here Poseidon built the walls of Troy, hence called Neptunlia Pergama. When Laomedan refused the wages due, Poseidon sent a sea-monster, which would have devoured the king's daughter Hesione if she had not been rescued by Heracles. In the Trojan War, Poseidon naturally sided with the Greeks, though he became hostile to Odysseus after he had blinded Polyphemus, son of the god.

105. Poseidon desired earthly kingdoms, his attempts to take control possibly being political myths. He disputed with Athene for the possession of Athens, but she was awarded the city because her planting of the olive was judged the better gift. When these divinities, however, disputed the possession of Troezen, Zeus judged they should share it equally. In his claim for Corinth, Poseidon received only the isthmus, where the quadrennial Isthmian games were held in his honour, while the Areopagus was awarded to Helios.

106. Poseidon first intended to marry Thetis, but when it was prophesied that her son would be greater than his father he paid court to Amphitrite, daughter of Nereus. Only after Delphinos had most eloquently pleaded his suit did Amphitrite accept Poseidon, who in gratitude placed Delphinos' image among the stars, as the Dolphin. Amphitrites' reluctance, paralleled by Hera's shrinking from Zeus, and Persephone's from Hades, probably represents the resistance of an early matriarchal society to a patriarchal system.

107. Poseidon's son by Amphitrite was Triton, but he had many more children by other divinities and mortals.

108. One of them, Scylla, was particularly hateful to Amphitrite, who is said to have turned her into a monster with six barking heads and twelve feet. Poseidon also loved the nymph Tyro, mother of his children Pelias and Neleus, and Æthra, the mother of Theseus. His offspring by Medusa were Chrysaor and Pegasus.

109. Sacrifices to Poseidon were usually black-and-white bulls. His symbol of power was the trident, possibly in origin a thunderbolt, by means of which he could shake the earth or subdue the waves, and which became in Hellenistic and Roman times a symbol of sea-power, as it is today. Poseidon's other attributes were the horse and the dolphin, and he was usually represented as accompanied by Amphitrite, Triton, Nereids, and dolphins.

DEMETER, 110–116.

110. Demeter, counterpart of the Roman Ceres, was probably in origin a divinity of the Minyans, who entered Greece in about 200 B.C., and who revered her as an earth-goddess, a mate to their sky-god, who later developed as Poseidon. Both these divinities could take the form of a horse. The worship of this earth-goddess then merged with that of the Great Goddess of the pre-Hellenic matriarchal society, and Demeter was worshipped as the corn-goddess.

111. She was daughter to Cronus and Rhea, and sister to Zeus, by whom she became the mother of Persephone, or Core, the maiden, herself another aspect of the goddess. According to the Homeric Hymn of the seventh century B.C., Hades asked Zeus' permission to marry Persephone, and as he received no downright refusal was emboldened to carry off the maiden as she was gathering flowers. Demeter wandered the earth searching for her daughter until Helios told her what Hades had done. She then shunned Olympus and wandered still on earth, which she forbad to bring forth fruit. Zeus finally told Demeter that her daughter might return, provided she had eaten nothing in the Underworld, and he sent Hermes to escort her back. Hades agreed to let Persephone go, but gave her a pomegranate to eat, and it was at last agreed that she should spend a third of the year with him in Hades, as Queen of the Underworld, and the rest of the year with Demeter, who once more allowed the earth to bear its fruit.

112. Inconsistent accounts are given of the place of the rape. Demeter's priests said it was Eleusis, about twelve miles from Athens, the Latin poets Enna in Sicily, where, according to Ovid, Persephone was gathering poppies. Some say it was Ascalaphus who saw Persephone take food in the Underworld and that because he revealed this, he was turned by Demeter into an owl.

113. It is said that during her wanderings, Demeter punished those, like Abas, son of Celeus, who were unkind to her, but showered blessings on those like Celeus himself and his son Triptolemus who received her hospitably in Eleusis and whom she taught the art of agriculture.

114. The Eleusinian Festival in honour of Demeter and Persephone was probably fully established in Athens by Pesistratus at the end of the sixth century B.C., probably about the time when the cult of Dionysus was instituted. There was an annual procession from Eleusis to Athens, and those who spoke Greek could be initiated into the final rite of the mysteries. The Thesmophoria, celebrating the foundation of laws, was also held in the goddesses' honour, in Athens and in other parts of Greece.

115. The myth originated in the most primitive rites of seed time and harvest at a time when only women practised the arts of agriculture. Persephone, representing the vegetation which dies down during the winter, had her counterpart in the primitive corn-puppet which was buried in winter to be dug up again sprouting in spring, and later writers saw the story as an expression of the death of the body and the immortality of the soul.

116. In art Demeter was represented with a garland of corn or a ribbon, and holding a sceptre, corn ears, or a poppy, and sometimes a torch and basket. Pigs were sacred to her. There is in the British Museum a fine statue of Demeter of about 330 B.C., which was found at Cnidos in Asia Minor.

DIONYSUS, 117–128.

117. Dionysus, god of wine, also called Bacchus by both Greeks and Romans, was not in Homer's time one of the aristocratic Olympian deities, but a god worshipped by humble folk whom wandering bands of ecstatic worshippers brought into Greece from Thrace in the eighth century B.C. The cult, which spread through Macedonia and Thessaly, to Bœotia, Delphi, Athens, and beyond, was characterised by a mystic frenzy when the worshippers, intoxicated with wine, believed themselves to be at one with Dionysus or Bacchus, sometimes called Bromius "the Boisterous." The men who followed him were known as Bacchoi, the women Bacchæ, or Bacchantes or Mænads, or in Athens and Delphi, Thyiads.

118. The immense popularity of the Dionysian cult, especially with women, indicates that among the recently civilised Greeks there was a longing for a more instinctive and impulsive life, valuing enthusiasm rather than prudence, and during the sixth century certain wise statesmen introduced the new cult among the other state religions. Dionisiac festivals were established in Corinth, Sicyon, Delphi, and Athens. In Delphi the sepulchre of Bacchus was placed near the very tripod of Pythia, and his temple, a theatre, was at the highest point of the sacred precinct. In Athens Pesistratus founded the Dionysia and the Panathenaic Games at about the same time, and a theatre was set up where the worshippers of Bacchus enacted the first primitive drama. In the fifth century, when the Parthenon was finished, the new god had been accepted among the twelve Olympians taking the place of Hestia. This change incidentally secured a majority of gods over goddesses on Mt. Olympus, and is perhaps evidence of a society becoming increasingly patriarchal.

119. Legends said that Dionysus was the son of Semele by Zeus, who visited his beloved disguised as a mortal. When Semele was six months with child, jealous Hera, disguised as an old woman, persuaded her to ask her mysterious lover to appear in his true form. Unwillingly Zeus consented, "hapless Semele" was consumed by fire, and her unborn child sewn up in Zeus' thigh to be delivered three months later as Dionysus.

120. The child was first entrusted to Athamas and Ino of Bœotia, and reared in the women's quarters disguised as a girl, until Hera undeceived punished Athamas with madness so that he killed his own son. Hermes then took Dionysus to Mt. Nysa, where the nymphs cared for him, feeding him with honey, and where he first invented wine. Zeus later placed the images of the nymphs among the stars as Hyades.

121. When Dionysus had grown to manhood Hera drove him mad and he wandered through the world with his old tutor Silenus and a wild rout of Satyrs and Mænads. He went through Egypt, Syria, and Asia to India, overcoming military opposition, teaching the culture of the vine, founding cities and laws. He returned to Europe through Phrygia and then invaded Thrace.

122. Here Lycurgus, King of the Edones, opposed his worship, but, maddened by Rhea, he killed and mutilated his own son, and the Edones caused him to be torn to death by horses.

123. Dionysus now proceeded to Bœotia, and in Thebes was resisted by King Pentheus. But Pentheus was also driven mad and torn to pieces by the Mænads or Bacchæ, among whom were his own mother Agave and her two sisters, for in their frenzy they believed him to be a wild beast. This is the legend used by Euripides in his play, *The Bacchæ*.

124. Dionysus also visited the islands of the Adriatic. At Icaria he hired a ship bound for Naxos, but the sailors were Tyrrhenian pirates and steered towards Asia, intending to sell Dionysus into slavery. The god, however, turned himself into a lion and the oars into serpents. Ivy grew round the ship and flutes were heard. The terrified pirates, leaping overboard, were transformed to dolphins. Arrived at Naxos, Dionysus found Ariadne deserted by Theseus and at once married her. A Renaissance conception of this incident can be seen in Titian's picture "Bacchus and Ariadne" in the National Gallery, or in Tintoretto's picture in the Doge's Palace in Venice.

125. At Argos people refused at first to accept Dionysus, but when the women had been maddened by him, they admitted he was a god.

126. His worship established throughout the world, Dionysus was received into Olympus as one of the twelve great divinities, taking the place of Hestia. He brought Semele there from the Underworld, and she was henceforth known as Thyone.

127. Dionysus was worshipped as god of the vital and intoxicating powers of nature, and also, because of his close connection with tillage and early civilisation, as a law-giver. He was also god of tragic art. In art he was represented as young, handsome, and athletic, but later as slightly effeminate. He was accompanied with a wild crowd of Satyrs, and Mænads, the latter frenzied with wine and mystic exaltation, and carrying cymbals, swords, serpents, or the Thyrsus, a wand wreathed with ivy and crowned with a fir-cone. The worship of Dionysus appealed strongly to women, and many would spend the whole night on the mountain in ecstatic dancing and tearing wild animals to pieces. Sacred to the god were the ivy, laurel, and asphodel, and the dolphin, serpent, tiger, lynx, panther, and ass. His sacrifice was usually a goat or ass.

128. The myths of Dionysus are evidence that there was at first much opposition to the ritual use of wine, and the frenzy it engendered. The earlier drink of the Greeks had been a kind of beer flavoured with ivy and mead, and mead was the drink of Homer's Olympians. Wine was not invented by the Greeks, but probably first imported by them from Crete, whither vine culture had probably spread from Mt. Nysa in Libya. The use of wine spread from Thrace to Athens and other civilised cities. The story of Dionysus' wanderings in India represents the spread of vine culture there.

PERSEUS, 129–144.

129. The ancient folk-tale of Perseus, grandson of Acrisius, has been told by Kingsley in *The Heroes*.

130. Acrisius and Prœtus, the twin sons of Abas, King of Argos, eventually agreed, after much discussion, to divide their inheritance. Proetus became ruler of Tiryns, whose massive walls he built by the aid of the Cyclopes, while Acrisius ruled uneasily in Argos, for an oracle had declared that he would be killed by a son born to his daughter Danaë.

131. To prevent this disaster, Acrisius had Danaë immured in a brazen dungeon or tower, with doors of brass, but all in vain, for Zeus visited her in a shower of gold, and she became the mother of Perseus.

132. Not daring to kill Danaë, Acrisius set mother and son adrift on the sea in a chest, which floated to the isle of Seriphos, one of the Cyclades. Here it was found by the sailor Dictys, and he took Danaë and her son to the king Polydectes, who received them hospitably.

133. When Perseus was grown to manhood, however, Polydectes sought to marry Danaë and

seized a pretext to send Perseus off to fetch the head of the Gorgon Medusa.

134. Medusa and her sister Gorgons, Stheno and Euryale, who were the daughters of Phorcys and Ceto, and dwelt in Libya, had once been beautiful. But Medusa lay with Poseidon in one of the temples of Athene, and the enraged goddess turned her into a winged monster with brazen claws and serpent hair, so hideous that she turned to stone all who looked upon her.

135. Athene, eager to help Perseus, against her enemy, gave him a polished shield whereby he might see Medusa only in reflection. Hermes provided him with a sickle, and told him how to procure winged sandals, a magic wallet in which to carry the decapitated head, and Hades' helmet of invisibility.

136. On Hermes' advice Perseus visited the Gorgons' sisters, the Grææ, three old women grey from birth who had only one eye and one tooth between them, and these they passed from one to another. Perseus found them on Mt. Atlas, and, by snatching the eye and tooth, forced the Grææ to tell him where he could find the sandals, wallet, and helmet. They directed him to the Stygian nymphs, who gave him what he needed.

137. Flying westward to the land of the Hyperboreans, Perseus found the Gorgons asleep. He successfully beheaded Medusa and was astonished to see, springing fully grown from her body, the winged horse Pegasus and the warrior Chrysaor, both of whom had been begotten on her by Poseidon.

138. Though pursued by Stheno and Euryale, Perseus in Hades' helmet escaped to the south. Some say that he petrified the Titan Atlas by showing him the Gorgon's head and then flew over Æthiopia.

139. Here he saw, chained naked to a rock on the sea coast, the lovely Andromeda, and at once fell in love with her. He learned the cause of her plight from her parents, Cepheus, King of Æthiopia, and his wife Cassiopeia. The latter had rashly boasted that Andromeda was more beautiful than the Nereids, and when they had complained of this to Poseidon, the sea god had sent a monster to lay waste the country. Only by the sacrifice of Andromeda, said the oracle of Ammon, could the land be delivered.

140. Perseus promptly offered to rescue the maiden, provided she would become his wife, but, after he had slain the monster, Cepheus and Cassiopeia were reluctant to keep their promise, for they said Andromeda had already been contracted to another. Their protégé and his followers, arriving at the wedding, attempted to seize the bride, but were easily circumvented by Perseus, who showed them Medusa's head and turned them all to stone. Poseidon set the images of Cepheus and Cassiopeia among the stars, the latter in a humiliating position.

141. Perseus, with Andromeda, now hastened to Seriphos, where he found that Danaë and Dictys had been obliged to take refuge in a temple, but going to Polydectes' palace, he exposed the Gorgon's head and turned the king and all his followers to stone. He then gave the head to Athene, who set it in her ægis, and Hermes restored Perseus' accoutrements to the Stygian nymphs.

142. After making Dictys King of Seriphos, Perseus, taking with him Danaë and Andromeda, returned to Argos, and Acrisius, mindful of the oracle, fled to Larissa, in vain, however, for Perseus, visiting Larissa and taking part in public games, accidentally killed his grandfather by a throw of the discus.

143. Grieved by this mishap, Perseus arranged to exchange kingdoms with his cousin Mega-[illegible]es, the son of Prœtus, who now moved to [illegible]s while Perseus became King of Tiryns. He also founded Mycenæ, which, like Tiryns itself had mighty fortifications built by the Cyclopes.

144. The massive remains of both cities have been investigated by Schliemann and other archæologists, and remain as some of the most interesting antiquities in all Greece.

BELLEROPHON, 145–150.

145. The story of Bellerophon is told by William Morris in *The Earthly Paradise*.

146. Bellerophon, the son of Glaucus, King of Corinth, having killed one Bellerus, fled to Prœtus, King of Tiryns. Unfortunately Prœtus' wife, Anteia, fell in love with the young man, and when he refused her advances falsely accused him to her husband of trying to seduce her. Prœtus, reluctant to kill a guest, sent him instead to Anteia's father, Iobates, King of Lycia, carrying a letter which requested that the bearer be put to death.

147. Iobates also shrank from killing a guest and decided to send Bellerophon against the Chimæra, a fire-breathing monster with a lion's head, goat's body, and serpent's tail, said to be the offspring of Echidne and Typhon, which was now ravaging Lycia.

148. Bellerophon was advised to catch the winged horse Pegasus, sprung from Medusa. Pegasus, by striking his hoof on the earth of Mt. Helicon, had created the spring of Hippocrene, sacred to the Muses, and he was found by Bellerophon at another of his fountains, that of Pirene in the Acropolis of Corinth. The hero flung over the horse's head a golden bridle, which Athene had given him, and astride his flying steed he easily shot the Chimæra with his arrows.

149. The frustrated Iobates now sent Bellerophon against the Amazons, and, when the hero again returned victorious, planted an ambush of guards against his arrival. Bellerophon slew them all, and Iobates, convinced at last that there had been some mistake, produced Prœtus' letter and learned the truth. He gave his guest his daughter in marriage and made him his heir.

150. Later tradition records that Bellerophon presumptuously tried to soar to Olympus mounted on Pegasus, but that Zeus sent a gadfly which stung the horse and caused him to throw his rider to earth. Bellerophon ended his days in wretchedness, but Pegasus gained Olympus.

JASON AND THE ARGONAUTS, 151–163.

151. The story of Jason and the Argonauts was already popular in Homer's day, and has more recently been told by Kingsley in *The Heroes*, and by William Morris in *The Life and Death of Jason*.

152. Jason's father Æson, the rightful King of Iolcus, had been deprived of his kingdom by his two half-brothers, Pelias and Neleus. The mother of all three was Tyro, who, seduced by Poseidon, bore him the twins Pelias and Neleus. She exposed the twins, but they were reared by a horse-herd, and when Tyro later married Cretheus, founder and King of Iolcus, they were adopted by him.

153. Tyro's son by Cretheus was Æson, but on Cretheus' death Pelias imprisoned Æson, expelled Neleus, and made himself supreme. The life of Æson's infant son Jason was saved only because he was smuggled out of Iolcus and entrusted to the care of Cheiron, the Centaur.

154. When a young man, Jason returned to Iolcus, fearlessly demanding his kingdom, and

Pelias, to be rid of him, asked him to go to Colchis to fetch the golden fleece. This, the fleece of the ram on which Phrixus had escaped, and which he had given to King Æëtes of Colchis, was now hanging on an oak-tree in the grove of Ares, guarded night and day by a sleepless dragon.

155. Jason welcomed the enterprise and commanded Argus, the Thespian to build him a fifty-oared ship called the *Argo*, into whose prow Athene herself fitted an oracular beam. Most of the heroes of the day flocked to join Jason, and his crew included the Dioscuri, Castor and Polydeuces, Heracles, and Orpheus the musician.

156. They met many adventures on the way. After lingering too long with the women of Lemnos, they slipped through the Hellespont and reached Mysia. Here Hylas, the squire of Heracles, while fetching water was stolen away by the Naiads, leaving nothing but an empty pitcher, and Heracles left the *Argo* in a vain search for him.

157. On the island of Bebrycos the Argonauts were met by its king, Amycus, son of Poseidon, and a renowned boxer, who contrived to kill all strangers by challenging them to a boxing match, but Polydeuces met the challenge and killed the bully. In Thrace they freed the blind king and prophet Phineus from a plague of Harpies, and in gratitude he advised Jason how to navigate the Bosphorus. At its entrance were the perilous floating islands, the Symplegades. It is possible that rumours of icebergs gave rise to the fable of these islands, which clashed together and crushed any ship which attempted to pass between them. But Jason, following the advice of Phineus, released a dove, and the *Argo* slipped between the islands as they recoiled. Henceforth they remained fixed. After overcoming other dangers, the Argonauts at last reached the River Phasis and Colchis.

158. Here Æëtes promised that he would give Jason the fleece if he could yoke together two fire-breathing bulls with brazen feet, the work of Hephæstus, plough the field of Ares, and sow it with the dragon's teeth left over by Cadmus at Thebes. It was Medea who enabled Jason to perform this terrible task. This sorceress princess, the daughter of Æëtes by his first wife, fell instantly in love with Jason and promised to help him if he would swear by all the gods to marry her and be faithful. She gave him a fire-resisting lotion and he completed the task. Then when Æëtes failed to keep his promise Medea charmed the dragon to sleep while Jason took down the fleece and they fled together in the *Argo*.

159. The furious Æëtes pursued them, but Medea ruthlessly murdered the young half-brother Absyrtus she had brought with her, and cut him into pieces which she dropped one by one over the side of the boat. Æëtes, stopping to collect the fragments for burial, soon lost sight of the fugitives.

160. There are many conflicting accounts of the *Argo*'s return journey, but none of them is feasible, for the Greek knowledge of geography was at that time very limited. Tradition said that the ship reached the Western Mediterranean and visited the island of Circe, who purified Jason and Medea of murder.

161. On their return to Iolcus they found that Pelias had forced Æson to take his life, though one tradition mentioned by Ovid and by Shakespeare in *The Merchant of Venice*, says that he was renewed to youthful vigour by Medea. All agree that Medea took a terrible revenge on Pelias. She persuaded his daughters, with the exception of Alcestis, to cut their father up and boil him in a cauldron, promising falsely that this would rejuvenate him. Pelias' son Acastus, horrified at the murder, then expelled Jason and Medea and they repaired to Corinth.

162. For many years they lived happily until they were involved in the final tragedy, dramatised by Euripides in his *Medea*. Jason deserted Medea for Glauce, also called Creusa, daughter of Creon, and the sorceress sent the young bride a garment which consumed her in flames, set fire to the palace, and involved Creon also in death. Some say that Medea also killed her own children by Jason.

163. Medea then escaped in a chariot drawn by winged serpents and took refuge with Ægeus of Athens, who married her. But on Theseus' arrival in the city, Medea departed and after many wanderings became an immortal. Some say that Jason took his own life; others that he was mercifully killed when the poop of his own ship *Argo* fell upon him.

HERACLES, 164-202.

164. Heracles, the most famous of the Greek heroes, was the son of Alcmene by Zeus.

165. Alcmene's brothers having been killed by the Taphians, she would not consummate her marriage with her husband Amphitrion, son of Alcæus, until he had avenged their death. While Amphitrion was away from Thebes fighting the Taphians, Zeus visited Alcmene in her husband's likeness and told her how he had been victorious. The true Amphitrion returned the following day, and the ensuing confusion is the theme of comedies by Plautus, Molière, and Dryden.

166. Nine months later Zeus boasted that he was about to become the father of a son who would be called Heracles, or glory of Hera, and who would be ruler of the house of Perseus. The jealous Hera exacted from him a promise that any son born that day to the house of Perseus should be king. She then hastened the birth of Eurystheus, who was a grandson of Perseus, and delayed that of Heracles. Alcmene bore two children, Heracles, son of Zeus, and Iphicles, Amphitrion's son, who was a night younger. Alcmene, fearing Hera, exposed Heracles, but Hera in error nursed him, thus conferring on him immortality.

167. Returned to Alcmene, Heracles prospered, and when still in his cradle, strangled with either hand two terrible snakes which Hera had sent to destroy him. In his youth he was taught how to drive the chariot by Amphitrion, fighting by Castor, how to sing and play the lyre by Eumolpus, wrestling by Autolycus, and archery by Eurytus. Linus, who was once teaching him to play the lyre, censured him, and Heracles then promptly killed his teacher with his own lyre, so Amphitrion sent him away to keep cattle.

168. In his eighteenth year he set out to attack the lion of Mt. Cithæron which was destroying the herds of both Amphitrion and his neighbour Thespius. The chase lasted fifty days, and Thespius, who was Heracles' host all this time; rewarded him by giving up his fifty daughters to him. Heracles killed the lion with a wild-olive club and made himself a garment of the pelt, with the head as helmet, though some say that he wore the skin of the Nemean lion.

169. On his return to Thebes, Heracles challenged the Minyan heralds from Orchoinenus, who had come to collect tribute of cattle, and then led a victorious campaign against the Minyans in which his foster-father Amphitrion was killed.

170. Heracles was rewarded by Creon King of Thebes, who gave him his eldest daughter, Megara or Megera, in marriage, and Heracles became by her the father of several children. Creon's youngest daughter was married to Iphicles.

171. But Hera now visited Heracles with madness, so that he killed his own children and two o Iphicles'. When he recovered his reason he went, after purification, to consult the oracle at Delphi. The Pythia, calling him, for the first time, Heracles, advised him to go to Tiryns and there serve Eurystheus King of Argos for twelve years, doing whatever he was commanded. At the end of that time immortality would be conferred on him.

172. Most reluctantly Heracles set out. The gods gave him gifts of armour, but he relied on his bow and arrows and on the olive clubs which he cut for himself. His nephew Iolaus, oldest son of Iphicles, accompanied him as his faithful charioteer and companion. Thus supported, Heracles embarked on the twelve gigantic tasks imposed on him by Eurystheus.

The Twelve Labours of Heracles.

173. The First Labour was to bring back the skin of the Nemean or Cleonæan lion, an enormous creature, said to be the offspring of Typhon and Echidne, which was devastating the valley of Nemea near Cleonæ. As the pelt could not be pierced by any weapon, Heracles strangled the lion with his hands. He rededicated the Nemean games to Zeus and took the lion's carcase back to Tiryns, where he flayed it with its own claws. Some say that he wore the pelt as his armour. Eurystheus was so terrified that he now took refuge in a brazen urn below the earth whenever Heracles approached.

174. The Second Labour was to kill the Lernean Hydra, another monster which was said to be the offspring of Echidne by Typhon, and which Hera brought up. It lived at the sevenfold source of the River Amymone and haunted the neighbouring swamp of Lerna. It had a dog-like body and nine snaky heads, one of them immortal. As soon as Heracles struck off one head with his club, two grew in its place, while an enormous crab seized the hero's foot. He crushed the crab and called on Iolaus to burn the necks of the eight heads as he crushed them. The immortal head was buried and Heracles poisoned his arrows in the monster's gall, so that henceforth any wound they caused was fatal. Hera placed the image of the crab among the signs of the zodiac.

175. The Third Labour was to capture alive the Ceryneian Hind. This creature had brazen feet and golden antlers, and was therefore often called a stag. Heracles pursued it tirelessly for a year, and eventually shot an arrow which pinned the forelegs together without causing bloodshed. He then carried the creature back on his shoulders.

176. The Fourth Labour was to capture alive the Erymanthian boar, which had come down from Mt. Erymanthus to ravage Psophis. During his journey Heracles was entertained by the Centaur Pholus, who had a cask of wine given by Dionysus. When this was opened, other Centaurs besieged the cave. Repulsed by Heracles, some of them fled to the Centaur Cheiron. Heracles accidentally wounded Cheiron, who was an old friend, with one of his poisoned arrows. Cheiron, an immortal, could not die, although he now longed to do so, and was relieved from pain only when he later surrendered his immortality to Prometheus. Heracles continued his pursuit of the boar, drove it into a snow-drift, bound it with chains, and carried it to Eurystheus, but when he heard that the Argonauts were gathering for Colchis he hastened to join them, accompanied by Hylas.

177. The Fifth Labour was to cleanse in one day the stables of Augeias, King of Elis, who had more cattle and sheep than any man on earth. The dung had not been cleared away for years. Heracles swore a bargain with Augeias that he would cleanse the stalls in one day in return for a tenth of the cattle, and Phyleus, son of Augeias, was a witness to their mutual oaths. Heracles then diverted the Rivers Peneius and Alphaeus through the stalls, which were thus cleansed in a day. But Augeias now learned that Heracles had been under Eurystheus' orders, and therefore refused the reward and even denied the bargain. When Phyleus was loyal to the truth Augeias banished him. Heracles later avenged himself on Augeias.

178. The Sixth Labour was to free the marshy lake of Stymphalia in Arcadia of the Stymphalian birds which were sacred to Ares. These maneating creatures had brazen beaks, claws, and wings, and used their feathers as arrows. Heracles, helped by Athene, frightened the birds with a rattle and then shot them down, though some say that they flew off to the island of Aretius in the Black Sea, where they were found later by the Argonauts.

179. The Seventh Labour was to capture the Cretan bull. Poseidon had sent the bull to Minos for a sacrifice, but he had substituted another, and it was now raging over the island. Heracles did not avail himself of Minos' offers of help, but captured the bull single-handed and took it to Eurystheus, who set it free again. It roamed through Greece to Marathon, where Theseus captured it and took it to Athens for sacrifice to Athene.

180. The Eighth Labour was to bring back the mares of Diomedes, a savage King of the Bistones in Thrace, who fed his horses on human flesh. On his way Heracles visited Admetus and freed Alcestis from death. Then with a few companions he drove the mares down to the sea, and turning to repel the attacking Bistones, he left them in the charge of his friend Abderus, who was soon eaten by them. Heracles, however, killed Diomedes and threw his body to the mares. He then founded the city of Abdera in honour of his friend and drove the mares back to Eurystheus, who set them free on Mt. Olympus, where they were eaten by wild beasts.

181. The Ninth Labour was to fetch for Admete, daughter of Eurystheus, the golden girdle that Hippolyte, Queen of the Amazons, had received from Ares. After an eventful journey through Europe and Asia, Heracles and his companions reached the land of the Amazons, where Hippolyte, sister of Antiope, received him kindly and promised him the girdle. But Hera roused the Amazons, and they attacked Heracles. In the fight he killed their leaders and Hippolyte herself, from whom he took the girdle. On his way home Heracles came to Troy, where he rescued Laomedan's daughter Hesione from a sea monster sent by Poseidon.

182 The Tenth Labour was to fetch the oxen of Geryon without either demand or payment. Geryon, a powerful monster with three bodies, lived on the island of Erythia. Its site was disputed. Some said it was beyond the ocean stream. Others identified it with Gades. Heracles travelled to the frontiers of Libya and Europe, where he set up two pillars, Calpe and Abyla, on the two sides of the Straits of Gibraltar, hence called the "Pillars of Hercules." When Helios shone too brightly, Heracles shot at him with an arrow, and Helios, admiring such boldness, gave him a golden cup or boat in which he sailed to Erythia. Geryon's cattle were guarded by the two-headed dog Orthrus, said to be the offspring of Typhon and Echidne, and the herdsmen Eurytion, son of Ares. Heracles felled both of these with his club, and, after overcoming Geryon, he sailed with the cattle to Tartessus in Spain, where he returned the golden boat to Helios. On his adventurous journey back through Gaul, Italy, Illyricum, and Thrace, he resisted many attempts, such as that of Cacus, to steal the cattle and eventually handed them over to Eurystheus, who sacrificed them to Hera.

183. The Eleventh Labour was to fetch the golden apples of the Hesperides. These grew on the tree which Hera had received from Ge at her wedding and which she had planted in a garden on Mt. Atlas. It was guarded by the Hesperides and the dragon Ladon, another offspring of Typhon and Echidne. Heracles first consulted Proteus, or as some say Prometheus, and, following the advice he received, he persuaded Atlas to fetch the apples, while he himself upheld the celestial globe. According to some, he also shot Ladon. Atlas, returning with three apples, tried to avoid taking back the burden of the globe, but Heracles, by a ruse, transferred the globe back to the giant's shoulders, took the apples, and hastened away. On his return journey he killed the giant Antæus, and also persuaded Zeus to free Prometheus, the arrow with which Apollo shot the vulture being placed among the stars as

Sagitta. Eurystheus made Heracles a gift of the apples, but the hero dedicated them to Athene, who returned them to their rightful place.

184. The Twelfth Labour was to bring back the dog Cerberus from Tartarus, the most difficult task of all. Heracles descended from Tænarum in Laconia and was guided by Athene and Hermes. After he had crossed the Styx and freed his friend Theseus and Ascalaphus, he obtained Hades' permission to carry away Cerberus, provided he could do so without using any weapon. Heracles seized Cerberus by the throat and dragged him up to show Eurystheus. He then carried the monster back to Tartarus.

185. According to most writers Heracles now returned to Thebes and gave his wife Megara to his nephew Iolaus, but Euripides, in his play *Heracles*, uses a different version. He represents the hero first killing the tyrant of Thebes, who had attempted to kill Megara and her children, and then, driven insane by Hera, himself killing his wife and family.

186. Heracles now desired to marry Iole, daughter of his friend Eurytus, King of Œchalia. Eurytus had promised her to the man who could surpass him and his sons in shooting with the bow. Though Heracles surpassed them all, Eurytus still refused to give him Iole because he had murdered his own children, and in this Eurytus was supported by all his sons except Iphitus. Later when Iphitus appeared suspicious of him, Heracles in a frenzy of rage slew him. Though purified from this murder, he was still troubled in mind, and consulted the Delphic Oracle. He was advised to serve as a slave and to give the proceeds to the family of Iphitus.

187. Heracles was purchased by Omphale, Queen of Lydia, and widow of Tmolus, and he served her either for one or for three years. Later writers say that he lived effeminately at this time, and that he used to change garments with Omphale, but others say that he continued to perform heroic deeds.

188. His period of servitude to Omphale completed, Heracles sailed against Troy. On a previous occasion, probably when returning from the land of the Amazons, Heracles and his friend Telamon had come to Troy, where they had found Laomedan's daughter, Hesione, exposed naked to a sea-monster, sent by Poseidon (*see para.* 104). Heracles had freed Hesione and killed the monster, but Laomedan had refused to give him the reward he had promised, the white horses given by Zeus in exchange for Ganymede.

189. Heracles and Telamon therefore now sailed to Troy to take their revenge. How they sacked the city is described in para. 275. Hesione was given to Telamon and bore him the son Teucer. On his return, Heracles faced a terrible storm raised by Hera and perils on the island of Cos. He was then led by Athene to Phlegra, where he helped the gods in their battle with the giants.

190. Heracles now took his revenge on Augeias, who had refused him payment for cleansing the stables. He invaded Elis and eventually killed Augeias, his sons, and their allies, the Moliones, though some say that he spared Augeias. He then founded the Olympic Games, and fetched from the source of the Danube the wild-olive tree whose leaves should crown the victor. Heracles then destroyed the city of Pylus, which had helped Elis. He killed Neleus the king and all his sons except Nestor.

191. Heracles next marched against Hippocoon who had fought against him under Neleus. Hippocoon had driven out his brother Tyndareus and seized the kingdom of Sparta. Heracles killed him and all his sons, and restored Tyndareus. He was helped in this enterprise by Cepheus and his twenty sons, but Cepheus and seventeen sons were killed. It was about this time that Heracles seduced the priestess Auge, daughter of Aleus, King of Tegea, and became by her the father of Telephus.

192. After four years in Arcadia, Heracles left for Ætolia, where Œneus was King of Calydonia and Pleuron. Heracles wished to marry Œneus' daughter Deianeira and won her by defeating Achelous, the mighty river-god, son of Oceanus and Tethys. He now sent Iolaus as leader of his sons by the daughters of Thespius to settle in Sardinia.

193. Three years later, while at a feast, Heracles accidentally killed the boy Eunomus, and went into voluntary exile, taking Deianeira and their son Hyllus.

194. They reached the River Evenus, across which the centaur Nessus carried travellers for a small fee. Heracles let Nessus carry Deianeira, while he himself swam, but the centaur galloped off with her and would have violated her if Heracles had not shot him through the breast. The dying centaur then told Deianeira to take his blood as a charm to keep Heracles' love.

195. Heracles now resided at Trachis, and from there invaded Œchalia with an army in order to avenge himself on Eurytus, who had refused to surrender his daughter Iole, even though Heracles had won her in the archery contest. The hero killed Eurytus and all his family, and sent Iole to Deianeira in Trachis while he visited Cenæum in Eubœa and prepared a thanksgiving sacrifice to Zeus.

196. He had sent Lichas to Deianeira to fetch a white shirt to wear at the ceremony. Deianeira, fearful that Iole might win Heracles' love, rubbed the shirt in Nessus' blood, not knowing that Heracles' arrow, steeped in the Hydra's blood, had poisoned it. When Heracles put the shirt on, it burned with excruciating agony into his body, and attempts to tear it off took his flesh with it. Heracles seized Lichas and flung him into the sea and then commanded his son Hyllus to take him to Trachis. Deianeira, aghast at what she had unintentionally done, hanged herself. Heracles asked Hyllus to promise to marry Iole and to build him a funeral pyre on Mt. Œta.

197. This tragic climax to Heracles' career has been dramatised by Sophocles in the *Women of Trachis*, or *Trachiniæ*, where Deianeiras' distress at Ioles' arrival and her ill-fated ruse to keep her husband's love are touchingly represented.

198. Heracles finally ascended his funeral pyre to be burned alive. To Philoctetes, who kindled the flame, he gratefully bequeathed his quiver, bow, and arrows. Thunderbolts demolished the pyre, and Heracles was carried by a cloud to Olympus. There he became immortal, Hera was persuaded by Zeus to adopt him as her son, and reconciled to her at last, he married her daughter Hebe.

The Children of Heracles, or Heracleidæ.

199. Eurystheus now determined to expel from Greece Alcmene and all the children of Heracles. Only in Athens did they find protection, and when Eurystheus attacked the city he was resisted by Theseus (or by his son Demophon), Iolaus, and Hyllus. As an oracle had demanded the sacrifice of one of Heracles' children, his daughter Macaria killed herself. Eurystheus was then defeated, by either Iolaus or Hyllus, and despatched by Alcmene.

200. These events are the theme of Euripides' play, *The Children of Heracles* or *Heracleidæ*.

201. Hyllus later, endeavouring to enter Peloponnesus, was slain in single combat by Echemus, King of Tegea. Only Tleopolemus settled in Argos.

202. Some generations later, the descendants of of Heracles conquered Peloponnesus in conjunction

with the Dorians. This legend indicates the conquest of the Achæans by the later invaders.

THESEUS, 203–218.

203. Theseus, the great hero of Attica, was the son of Æthra by Ægeus, King of Athens, though he was also reputed to be the son of Poseidon. Æthra was the daughter of Pittheus, King of Troezen and here she secretly brought up her young son.

204. When he was of age, Æthra showed him the sandals, and a sword which was an heirloom of Cecrops, that Ægeus had left for him under a great rock. Theseus was able to lift the rock, recover the tokens, and proceed to Athens.

205. He insisted on going not by sea, but by the dangerous land route, and, like Heracles, he freed the country of many terrors. He killed Periphetes, whose club he afterwards carried, Sinis, the the wild sow of Crommyum, Sciron, Cercyon, and Sinis' father Polypemon, who was surnamed Procrustes.

206. Meanwhile in Athens Ægeus had married Medea, who had fled for safety from Corinth. Medea recognised Theseus, and jealous for Medus, her son by Ægeus, she attempted to poison him. But Ægeus recognised Cecrops' sword in time and welcomed his son with great rejoicing. Medea fled, taking Medus, and Theseus then scattered other rivals, the fifty sons of Pallas, nephews of Ægeus, who had hoped to succeed him to the throne.

207. Theseus next captured and sacrificed to Athene, the Marathonian bull which Heracles had brought from Crete and which had been driven to Marathon.

208. He now, of his own free will, went as one of the seven youths who with seven maidens were chosen by lot to be sent to Crete as yearly tribute, to be devoured there by the Minotaur. But Ariadne, daughter of Minos, King of Crete, fell in love with Theseus, and gave him a sword and a clue of thread by which he might find his way out of the labyrinth where the Minotaur lived. Theseus slew the monster, released his fellow Athenians, and fled with them and Ariadne, but at Naxos he deserted her and she was consoled by Dionysus, to whom the island was sacred.

209. Theseus forgot on his return to hoist the white sail which was to have been a sign of victory, and Ægeus, seeing the black sail, threw himself in despair into the sea now called Ægean. Theseus then became the King of Athens.

210. He is said to have invaded the country of the Amazons either with Heracles or later, and here he carried off Antiope, who became his wife, though according to another tradition, Theseus took not Antiope but her sister Hippolyte. It is "Hippolyta" who appears as his bride in *The Midsummer Night's Dream.* In revenge the Amazons invaded Attica, and were eventually defeated by Theseus in the midst of Athens itself.

211. Later Theseus married Ariadne's sister Phædra, another daughter of Minos, who bore him the sons Acamas and Demophon. But Phædra fell desperately in love with her step-son Hippolytus (Theseus' son by either Antiope, or Hippolyte), and when the young man rejected her advances she killed herself, after leaving a letter falsely accusing him to Theseus. The enraged Theseus prayed to Poseidon that Hippolytus might die that very day, and the god sent a sea-monster which so terrified the chariot horses of Hippolytus that they dragged him to death. The story is the theme of Euripides' tragedy *Hippolytus*, and the *Phèdre* of Racine.

212. Theseus was a close friend of Pirithous, King of the Lapithæ, and attended his wedding to Hippodameia, and when a drunken Centaur attempted to carry off the bride, Theseus joined with the Lapithæ in the famous fight against the Centaurs.

213. After Hippodameia's death, Pirithous and Theseus together carried off the girl Helen of Sparta, and she fell by lot to Theseus. As she was too young to marry, he concealed her in the village of Aphidnæ, where she was cared for by his mother Æthra.

214. Theseus then, full of misgiving, fulfilled his promise to Pirithous to help carry off another daughter of Zeus, by accompanying him to the Underworld to take away Persephone. But Hades chained them both to a rock, where they languished till Heracles came to the Underworld and released Theseus only (*see para.* 184).

215. Meanwhile Helen's brothers, the Dioscuri Castor and Polydeuces, invaded Attica, and being told by Academus where Helen was hidden, they rescued her, taking Æthra as her slave.

216. When Theseus returned from Tartarus he was unable to keep order among his people, who were being stirred up against him by Menestheus. He retired to the island of Scyros, where he was treacherously killed by King Lycomedes. He nevertheless returned in spirit to help the Athenians at the Battle of Marathon, and though Menestheus succeeded Theseus as king, the sons of Theseus were afterwards restored to the throne.

217. Theseus, like Heracles, took part in the heroic enterprises of his age. He joined in the Calydonian hunt and helped Adrastus at Thebes, and he may have been one of the Argonauts.

218. Although Athenians in later times looked on Theseus as an historical figure, ascribing political institutions to him, he was in fact a legendary hero.

CRETAN MYTHS, 219–239.

219. Recent archæological discoveries have indicated that many of the ancient legends concerned with Crete have a factual basis, and a very readable book on the subject is the "Pan" Book *Bull of Minos*, by Leonard Cottrell.

220. In 1899 Sir Arthur Evans began his excavations at Cnossos and soon unearthed the remains of the magnificent, unfortified and labyrinthine so-called "Palace of Minos" with its indications of an elegant and highly artistic civilisation.

221. From the architectural evidence available, scholars now consider that there existed in Crete between 2500 and 1400 B.C., a "Minoan" pre-Hellenic culture which had affinities with that of Egypt. This maritime, commercial culture, its sea-power making fortification unnecessary, spread to the mainland of Greece, where it became known as Mycenæan. It is in fact possible that Crete may have exercised some kind of suzerainty over the mainland. The Cretans probably worshipped a goddess who was served by priestesses. The favourite sport was bull-fighting, in which men and women toreadors showed amazing skill. Cretan architects and engineers were exceptionally ingenious.

222. Discoveries such as these give special significance to such legends as that of Minos' sea power, and of Crete's exaction from Athens of a tribute of men and maidens for the Minotaur. Again the constant appearance of the bull in Cretan legend and Dædalus' building of the labyrinth appear to have foundation in historical fact.

223. It was to Crete that Zeus, in the form of a bull, brought Europa, said to be the daughter of Agenor, son of Poseidon and King of Phœnicia, and of his wife Telephassa.

224. As the lovely Europa was playing on the sea-shore with her maidens, Zeus appeared as a white bull and she dared to climb on his back, an incident depicted in the masterly painting by

Paul Veronese in the Palace of the Doges in Venice. Suddenly Zeus, plunging into the sea, carried off Europa to Crete, where he fathered on her the three sons, Minos, Rhadamanthus, and Sarpedon. When the reigning king later married Europa he adopted her three sons as his heirs.

225. The brothers quarrelled, however, over the boy Miletus, son of Apollo. As Miletus preferred Sarpedon, they both fled from Minos to Asia Minor. Here Miletus founded the kingdom that bore his name, and Sarpedon, after aiding Cilix, King of Cilicia, against the Lycians, became king of the latter and was permitted by Zeus to live for three generations.

226. Rhadamanthus, though at first ruler of part of Crete, also found it wise to flee. He went to Bœotia, and on Amphitrion's death married Alcmene. So just a ruler did he prove, that he became one of the judges of the Underworld.

227. Minos, now sole ruler of Crete, was confirmed in his power by Poseidon, who sent him a magnificent white bull. This so delighted the king that he withheld it from sacrifice, and when it later ran savage it was captured by Heracles as his Seventh Labour, and eventually slain by Theseus.

228. Minos was the law-giver to Crete and was helped in the defence of the island by Talos, a bull-headed, brazen giant and by his powerful fleet.

229. Curious legends are told of Minos' loves. One was Procris, another Britomartis, a Cretan nymph whom he pursued for nine months, until she leaped into the sea and was deified by Artemis, sharing with her the epithet Dictynna.

230. Once when Minos was besieging Nisa, the port of Megara, which belonged to King Nisus, Scylla, Nisus' daughter, fell in love with him, and killed her father by cutting off the hair on which his life depended. Although Scylla let him into the city, Minos was so horrified at her parricide that he left her, and she swam after his ship until her father's soul, changed to a sea-eagle, pounced on her, and she was turned to the bird Ciris. Others say that Minos drowned Scylla, and she was turned into the fish Ciris. She has sometimes been confused with Scylla the daughter of Phorcys.

231. The wife of Minos was Pasiphaë daughter of Helios and Persë and several of their children, as Glaucus, Androgeos, Ariadne, and Phædra were the subject of legend.

232. Glaucus when a boy was drowned in a cask of honey, and his body found by the seer Polyeidus. Unable to resuscitate Glaucus, Polyeidus was entombed with him, but here a serpent revealed a herb which restored Glaucus to life, and the seer and the boy were released.

233. Androgeos won every contest in the Panathenaic games and was slain at the instigation of Ægeus. Minos in revenge exacted from Athens a yearly tribute of seven youths and maidens to be devoured by the Minotaur.

234. This monster with bull's head and man's body, was the offspring of Pasiphaë and the white bull. Dædalus the craftsman had enabled her to satisfy her desire, and afterwards built the labyrinth in which her shameful offspring was housed.

235. When Ægeus' son Theseus voluntarily joined the youths destined for the Minotaur, Ariadne fell in love with him, and enabled him to kill the monster by giving him a sword and a clue of thread by means of which he found his way out of the labyrinth. Ariadne then escaped with Theseus, but was deserted by him on Naxos, where she was found by Dionysus, as depicted in Titian's "Bacchus and Ariadne" in the National Gallery. Tintoretto's picture in the Doge's Palace in Venice shows the marriage of Ariadne to the god.

236. Her sister Phædra was later married to Theseus, and her unrequited passion for her stepson Hippolytus and its tragic outcome has been described in para. 211.

237. The cunning Dædalus, whose craftsmanship was symbolic of the latest development in sculpture and architecture, had been welcomed by Minos after his flight from Athens. The legend runs that he had been so bitterly jealous of his nephew Talos, or Perdix, inventor of the saw, chisel, and compasses, that he threw him headlong from Athene's temple on the Acropolis. Athene changed Talos into the bird "perdix" or partridge, and the Areopagus banished Dædalus.

238. Welcomed to Crete, he found his skill greatly valued by Minos, until the king discovered how he had aided Pasiphaë. Minos then imprisoned Dædalus with his son Icarus in his own labyrinth. They were released by Pasiphaë, and Dædalus made wings fastened to the shoulders with wax on which they flew away. Icarus mounted too high, the sun melted the wax and he was drowned in the Icarian Sea, but Dædalus reached Cumæ near Naples, and fled thence to Sicily. Here Cocalus welcomed him, and when Minos pursued the craftsman, Cocalus' daughters enabled him ingeniously to kill the king.

239. After Minos' death, although his son succeeded him, Cretan civilisation collapsed. Minos himself became a judge in the Underworld.

THEBAN MYTHS, 240–271.

240. The legend concerning the origin of Thebes is that of Cadmus, who according to common tradition was the son of Agenor, son of Poseidon and the King of Phœnicia, and of his wife Telephassa.

241. The sister of Cadmus, Europa, was one day carried off by Zeus, who appeared to her in the form of a bull (as is described in para. 224) and Agenor sent Cadmus in search of his sister.

242. Unable to find her, Cadmus consulted the Delphic oracle, who advised him to relinquish his search but to follow a cow and build a town where she should sink down with fatigue. Cadmus followed the cow from Phocis to Bœotia, and where she rested he built Cadmea, later the citadel of Thebes.

243. Making sacrifice to Athene, he sent his men for water from a spring of Ares not knowing that it was guarded by a dragon which killed most of his men. When Cadmus had killed the dragon Athene advised him to sow its teeth, and immediately there sprang up, fully armed, the Sparti, or "Sown Men," who fought with each other till only five survived—Echion, Udæus, Chthonius, Hyperenor, and Pelorus. These five were the ancestors of Thebes, and with their help the Cadmea was built.

244. Zeus gave to Cadmus as wife Harmonia, daughter of Ares and Aphrodite, and the Olympian deities attended the wedding. Harmonia received as a gift from Aphrodite the famous necklace made by Hephæstus, which Zeus had originally given Europa, and which conferred irresistible loveliness upon its wearer. From Athene she received a magic robe which conferred divine dignity. The children of Cadmus and Harmonia were Autonoe, Ino, Semele the mother of Dionysus, Agave, Polydorus, and later Illyrius.

245. It is said that Cadmus introduced to Thebes from Phœnicia the use of letters.

246. In old age Cadmus resigned the throne to Pentheus, his grandson, the son of Agave and Echion. But Pentheus, resisting the worship of Dionysus, was destroyed by Agave and her sisters Autonoe and Ino, as is depicted in *The Bacchæ* of Euripides.

247. Cadmus and Harmonia then left Thebes and were later, in the form of serpents, received in the Islands of the Blessed.

248. Another legend concerning Thebes is that of Amphion and Zethus the twin sons of Antiope by Zeus.

249. Antiope was divorced by her husband Lycus of Thebes, and cruelly treated by his second wife, Dirce. Meanwhile Amphion and Zethus were brought up by cattle men on Mt. Cithæron. When they were old enough to know what had happened they took their revenge. They killed Lycus and Dirce, who was tied to the horns of a wild bull and her body thrown into a fountain which henceforth bore her name, and then took possession of Thebes.

250. Amphion and Zethus now built the lower fortifications below the Cadmea, and so skilfully did Amphion play on the lyre given him by Hermes that the stones moved into place of their own accord. The brothers ruled jointly, Zethus married Thebe, who gave her name to the city, and Niobe became the wife of Amphion.

251. Niobe, the proud daughter of Tantalus and sister of Pelops, had seven sons and seven daughters, and boasted that she was superior to Leto, who had only two children. As punishment to her, Apollo killed the boys with his arrows, and Artemis the girls, and Niobe "all tears" was turned by Zeus into a stone on Mt. Sipylus. The crag of Niobe, being snow-capped, appears to weep when the sun strikes the snow. It is said the Amphion also was either killed by Apollo or that he took his own life.

252. Most famous of Theban kings was Œdipus, who claimed direct descent from Cadmus through Polydorus, Labdacus, and Laius, and all three of the great Greek tragic dramatists were inspired by the fateful story of Œdipus and his children.

253. Œdipus the son of Laius, King of Thebes, and of his wife Jocasta, was as a new-born child exposed on Mt. Cithæron, his feet tied together and pierced with a nail, for Laius had learned from the oracle at Delphi that he would be killed by his own son. Found by a shepherd of Polybus, King of Corinth, the child was called from his swollen feet Œdipus, and was reared by Polybus as his own son.

254. When Œdipus grew to manhood, he was told by the Delphic oracle that he was destined to kill his own father and marry his mother, and he resolved never to return to Corinth. But going from Delphi, he met Laius riding in a chariot, and in a quarrel killed him.

255. Laius had been on his way to ask the Delphic oracle how he could rid Thebes of the Sphinx, a winged lion with the head and breast of a woman. This monster was said to be the offspring of Typhon and Echidne, or of Orthrus and the Chimæra. Seated on a rock, she challenged each wayfarer with her riddle and strangled him when he failed to solve it.

256. Œdipus, arriving in Thebes, heard the Sphinx's riddle. "Which being, having only one voice, has sometimes two feet, sometimes three, and sometimes four and is weakest when it has most." Œdipus answered rightly that the being was man, who crawls in infancy and supports himself with a staff in old age, and the Sphinx thereupon flung herself to death.

257. As the Thebans had promised that whoever should vanquish the Sphinx should become king and marry Jocasta, Œdipus became King of Thebes and had four children by his own mother, Eteocles, Polyneices, Antigone, and Ismene.

258. Thebes, thus defiled by murder and incest, was visited by plague and the blind seer Teiresias said that the city would be saved when one of the "Sparti" (a title given also to descendants of the "Sown Men") should give his life. When he learned this, Menœceus, father of Jocasta, leapt from the walls to his death.

259. The plague still raging, Œdipus consulted Teiresias, and it is at this point that the famous *Œdipus Tyrannus* of Sophocles begins. Œdipus was horrified when at last convinced of his unconscious guilt and, after Jocasta had hanged herself, he blinded himself with a pin taken from her garment and prayed her brother Creon to banish him.

260. Eventually Œdipus went into exile accompanied by Antigone, and followed later by Ismene. At Colonos in Attica he found refuge in a grove of the Eumenides and, protected by Theseus, was received at last by the gods. These last hours of Œdipus are most touchingly presented by Sophocles in his *Œdipus at Colonos*.

261. Angered by his sons' neglect, Œdipus had cursed them, saying that they should divide their inherited land by the sword. They therefore agreed to rule in turn, but when Eteocles' term had expired he refused to abdicate. Polyneices then sought the help of Adrastus, son of Talaus and King of Argos, whose daughter Argia he married, while her sister Deipyle married Tydeus (son of Œneus of Calydon), who, on account of some murder he had committed, was also a fugitive.

262. When Adrastus prepared to restore Polyneices, his brother-in-law, the seer Amphiaraus, prophesied death for all the leaders save Adrastus. Amphiaraus had married Adrastus' sister Eriphyle, and Polyneices, following the advice of Tydeus, bribed Eriphyle, giving her the famous necklace of Harmonia on the condition that she would persuade her husband to joint the expedition.

263. Adrastus, Amphiaraus, Polyneices, and Tydeus were joined by Capaneus, Hippomedon, and Parthenopaeus, the son of Meleager and Atalanta, and these seven marched against Thebes. The war that followed was dramatised by both Æschylus, in his *Seven against Thebes*, and by Euripides, in *The Phœnician Maidens*.

264. After Thebes had suffered initial reverses, Teiresias prophesied that a royal prince must sacrifice himself, and a second Menœceus, the son of Creon, now took his own life.

265. The attackers were soon repelled. Capaneus, scaling the walls, was struck by Zeus with lightning. Tydeus, wounded by Melanippus, might have been saved by Athene with an elixir given her by Zeus, but Amphiaraus, who bore him a grudge, persuaded him to drink the brains of the dead Melanippus. This so disgusted Athene that she left him to his fate. Hippomedon and Parthenopæus also having been killed, offered to settle the dispute in single combat with Eteocles, but both were mortally wounded. Amphiaraus fled in his chariot and the earth opened and swallowed him. As the seer had prophesied, Adrastus was the only one of the seven left alive.

266. Thebes was not unscathed. The *Antigone* of Sophocles opens at the point where Creon refused to allow burial to Polyneices. The courageous Antigone dared to disobey him and he ordered that she should be imprisoned alive in a cave. Here she hanged herself, and Creon's son Hæmon, to whom she was betrothed, took his own life in despair.

267. Euripides, in *The Suppliants*, dramatises the next phase of the story. Since the Thebans had refused burial to their fallen enemies, Adrastus and the mothers of the slain went to Eleusis and secured the help of Theseus. He defeated the Thebans, and the bodies of the Argives received burial rites, but Evadne, daughter of Iphis and wife of Capaneus threw herself on to the flaming pyre and perished.

268. Thebes was again attacked ten years later, when Adrastus assembled the "Epigoni," the descendants of the "Seven." His own son Ægialeus made one, and also Diomedes, son of Tydeus, with his faithful companion Stheneleus, son of Capaneus and Evadne.

269. Since Alcmæon, like his father Amphiaraus, was unwilling to join the Epigoni, Thersander followed the example of his father Polyneices in

once more bribing Eriphyle, this time with the magic robe of Harmonia. She then persuaded Alcmæon to join the expedition along with his brother the seer Amphilochus.

270. Ægialeus was killed before the walls of Thebes, and Teiresias then advised the Thebans to evacuate the city and himself accompanied them, though he died next dawn on drinking from the well of Tilphussa. That day Adrastus, hearing of Ægialeus' death, also died of grief, and in accordance with Teiresias' prophecy the Argives took the empty city.

271. Alcmæon, on return, slew his mother Eriphyle, in revenge for her vanity and deceit towards his father and himself. Pursued by the Erinnyes, he fled to Phlegeus, King of Psophis, who purified him and gave him his daughter Arsinoë in marriage. Alcmæon gave his wife Harmonia's necklace and robe, but was soon forced by the Erinnyes to flee once more. He was next purified by the river-god Achelous and married his daughter Callirrhoë, who soon demanded the necklace and robe. Alcmæon, daring to revisit Psophis, obtained them from Phlegeus on the pretext of taking them to Delphi, but when Phlegeus discovered that they were destined for Callirrhoë he ordered his sons to slay Alcmæon. Finally, Phlegeus himself sent the ill-fated treasures to Delphi.

LEGENDS OF TROY, 272–352.

272. One of the most romantic discoveries of modern times is that of the German Schliemann, who, trusting the descriptions of Homer, excavated a site on the coast of Asia Minor, near the entrance to the Dardanelles. Between 1871 and 1873 he unearthed the foundations not of one Troy but of seven, his most spectacular find being a hoard of exquisite gold ornaments. His work proved that Troy belonged not only to legend but also to history.

273. It is now considered that in the Bronze Age Troy was an important centre for trade. Frequently attacked, it was many times rebuilt, and Greeks, Cretans, and Phrygians all claimed to have had a hand in establishing it. In Homer's time, when the sixth Troy was standing, it had probably absorbed three small towns, Dardania, Tros or Troy, and Ilium, and was probably inhabited by three tribes, Dardanians, Trojans, and Ilians, whose names are all represented in the early legends of Troy's foundation.

274. One of these tells how Scamander of Crete founded a colony in Phrygia, and how, jumping into the River Xanthus, he changed its name to his own. The nymph Idæa bore him a son Teucer (whence the Trojans are called Teucri), and Teucer gave a piece of land to Dardanus, the son of Zeus by the Pleiad Electra, who built there the town of Dardania. The grandson of Dardanus was Tros, who became the father of Ilus and also of Ganymede, whom he relinquished to Zeus for a gift of horses. The son of Ilus was Laomedan.

275. It was to Laomedan that Zeus assigned Apollo and Poseidon as labourers. They built for him the walls of Troy, and when Laomedan refused payment, Poseidon sent the sea-monster, which would have devoured his daughter Hesione had not she been rescued by Heracles. But again Laomedan refused the agreed reward—the white horses given by Zeus in exchange for Ganymede—and Heracles returned later to sack Troy. He gave Hesione to his fellow-warrior Telamon, and killed Laomedan and all his sons save Podarces, who was ransomed by his sister Hesione, and his name changed to Priam, which means "redeemed."

276. After a few years Priam sent Antenor to demand that Telamon should send back Hesione, and the Greeks' scornful refusal was one of the causes of the Trojan War.

277. Priam had fifty sons, nineteen of them by his second wife Hecabe, or Hecuba, who bore him many famous children, including Hector, Paris, Deiphobus and the prophetic twins Helenus and Cassandra. Troilus may have been her son by Apollo.

278. Before the birth of her second son, Hecuba dreamed that she had brought forth a blazing firebrand, and the new-born child was therefore exposed on Mt. Ida. Brought up by a shepherd, he was called Paris, and later, by his courage earned the name Alexander or "defender of men." Paris was beloved by the nymph Œnone, but he deserted her as the result of a tempting suggestion of Aphrodite's.

279. The occasion of this was the famous "Judgment of Paris," of which a Renaissance version can be seen in Rubens' picture in the National Gallery.

280. The story goes that alone of all the gods, Eris was not invited to the marriage of Peleus and Thetis, and in revenge she flung in the golden apple of discord with "to the fairest" inscribed upon it. Immediately Hera, Athene, and Aphrodite disputed its possession, and Zeus commanded Hermes to lead the goddesses to Mt. Ida for Paris to judge the dispute.

281. Although Hera promised him rule in Asia, and Athene fame in war, Paris gave the apple to Aphrodite, who promised him as his wife the loveliest of all women.

282. Paris now discovered his parentage and was joyfully welcomed by Priam, and under Aphrodite's protection sailed to Sparta.

283. His sister Cassandra foretold doom, but was as usual unregarded. In her youth she had been loved by Apollo, who had taught her the art of prophecy on condition that she became his lover. But she had disappointed him, and Apollo had then ordained that her prophecy should never be believed.

284. Welcomed to Sparta by King Menelaus, Paris fell in love with his beautiful queen, Helen, and in Menelaus' absence he succeeded in carrying her off to Troy with much treasure, thus precipitating the Trojan War, now inevitable by reason of an oath sworn by the leading chieftains of Greece to defend Helen's husband.

285. Helen, the daughter of Leda by Zeus, had been brought up in the Court of Leda's husband, Tyndareus of Sparta. So lovely was she that even as a young girl she had been carried off by Theseus and Pirithous, to be rescued and brought back by her brothers, the Dioscuri. All the noblest in Greece then became rivals for her hand, and at the instigation of Tyndareus swore an oath to defend her chosen husband.

286. Helen married Menelaus, and when the Dioscuri were immortalised, he succeeded Tyndareus as King of Sparta.

287. After Helen had fled with Paris, leaving her husband and daughter Hermione, Menelaus summoned the chieftains to war. His powerful brother Agamemnon, King of Mycenæ, who had married Helen's half-sister, Clytemnestra, was leader, and from the Peloponnese came also old Nestor of Pylus, whose Palace has only recently been discovered. Nestor was the only one of Neleus' twelve sons spared by Heracles. Renowned for wisdom and eloquence, he had been a courageous fighter. He had defeated the Arcadians and Eleans and had taken part in the Calydonian hunt and the fight between Centaurs and Lapithæ. Although he had ruled over three generations, he gladly joined the expedition to Troy.

288. The courageous Diomedes, son of Tydeus, and King of Argos, also came from the Peloponnese with eighty ships. He had been one of the Epigoni who had taken Thebes, and two fellow Epigoni came with him—Sthenelus, son of Capa-

neus, and Euryalus, the Argonaut. Tleopolemus, son of Heracles, the Argive who had settled in Rhodes, brought nine ships, and Palamedes, son of Nauplius, joined the muster from Eubœa.

289. But Agamemnon needed more distant allies, and together with Menelaus and Palamedes, he went to Ithaca to persuade Odysseus to join them.

290. Odysseus was the son of Anticleia, a daughter of the wily thief Autolycus, and of Lærtes, King of Ithaca, though some say that his father was really Sisyphus. He had won his wife Penelope, daughter of King Icarius of Sparta, in a foot race, and when Icarius had tried to persuade Penelope to remain with him, Odysseus had told her she might do as she wished. Penelope had veiled her face to hide her blushes and had followed her husband to Ithaca.

291. An oracle had warned Odysseus not to join the expedition to Troy, and when the envoys arrived they found him ploughing and sowing salt. But the far-sighted Palmedes placed Odysseus' infant son Telemachus in front of the plough, and Odysseus was tricked into revealing his sanity and joining the expedition.

292. Agamemnon also welcomed allies from Salamis and Locris. From Salamis, bringing twelve ships, came Great Ajax, son of King Telamon, a courageous fighter, who boasted that he needed not the help of the gods. His half-brother, Teucer, son of Telamon by Hesione and the best archer in Greece, fought behind Great Ajax' shield. Little Ajax also fought with them. Son of Oileus, King of the Locrians, he was small in stature but swift of foot, and skilled in throwing the spear. He brought forty ships.

293. An important contingent from Southern Thessaly also sailed to Troy, for Calchas, a renegade prophet from Troy, foretold that the city could not be taken without the help of Achilles, son of Peleus, King of the Myrmidones at Phthia in Thessaly, and of the Nereid, Thetis.

294. By dipping her son into the Styx, Thetis had made him invulnerable, except for the heel which she was holding. Achilles had been taught by Cheiron and by his tutor Phœnix, and was renowned for strength, speed, and high courage.

295. Thetis, knowing that if Achilles went to Troy he would never return alive, sent him disguised as a girl to the Court of Lycomedes, King of Scyros, and here Lycomedes' daughter Deidamia bore him the son Neoptolemus, or Pyrrhus. When Odysseus, accompanied by Nestor and Ajax, visited Scyros, he left a spear and shield among a pile of gifts for the maidens, and Achilles, seizing these, revealed his identity.

296. Achilles joined the Greeks together with his tutor Phœnix and Patroclus, his cousin, who had come as a boy to Peleus' Court after an accidental murder and had become the inseparable friend of Achilles.

297. The Greeks were further strengthened by Idomeneus, King of Crete, who brought 100 ships and shared the command with Agamemnon. Meriones accompanied Idomeneus.

298. The fleet was fortunate in being abundantly supplied with provisions, by Anius, son and priest of Apollo in Delos, for his three daughters who had been dedicated to Dionysus received from the god power to produce at will corn, oil, and wine.

299. The expedition set out from Aulis, but first made a false landing and ravaged the country of Telephus, son of Heracles and Auge, and now King of Mysia. When he repelled the Greeks, Dionysus caused him to stumble over a vine, and he was wounded by Achilles. Told by an oracle that his wound could be cured only by him who had inflicted it, he visited the Greeks, who likewise knew through an oracle that they could not take Troy without the aid of Telephus. Achilles therefore gladly cured him with rust from the spear which had injured him, and Telephus showed the Greeks the route they should take.

300. Assembled a second time at Aulis, the Greeks were delayed by unfavourable winds, for Agamemnon, by killing a hart, had vexed Artemis. Calchas foretold that only the sacrifice of Agamemnon's daughter Iphigeneia would appease the goddess, and Agamemnon reluctantly gave his consent, though some say that Artemis snatched Iphigeneia from the altar and bore her off to Tauris (*see para.* 396). Certainly the winds changed and the fleet set sail.

301. When they landed on the island of Tenedos, in sight of Troy, Achilles killed King Tenes and his father Cycnus, and here Philoctetes, son of Poeas suffered misfortune. Most famous of the Greek archers, he had been the friend of Heracles, and had received from him the famous bow and poisoned arrows when he set fire to the hero's funeral pyre on Mt. [illegible]a. He was now injured in the foot by one of th[illegible] arrows or, as some say, by the bite of a snake, [illegible] the smell of the wound became so offensive that, on the advice of Odysseus, Philoctetes was left behind on the island of Lemnos.

302. It was probably from Tenedos that the envoys Menelaus, Odysseus and Palamedes were sent to Priam to request the return of Helen. They were courteously entertained by Antenor, the wisest of the Trojans, who advised that Helen should be sent back, but the Trojans were obdurate.

303. The Greeks then attacked the mainland, and Protesilaus of Thessaly, who was an uncle of Philoctetes, was the first to leap ashore, though he knew through an oracle that it meant death. Wordsworth, in his poem *Laodamia*, tells how Laodamia his wife, the daughter of Acastus, desolate with grief, begged the gods to let her husband return for only three hours. Hermes led Protesilaus to her, and when he died the second time she died with him.

304. Achilles, the second to land on Trojan soil, soon distinguished himself as the most courageous and formidable of all the Greeks.

305. It was through Achilles that Æneas entered the war. At first he took no part, although he was the son of Priam's cousin Anchises. But when Achilles raided his herds on Mt. Ida, he led his Dadanians against the Greeks, and distinguished himself in battle. His mother, Aphrodite, frequently helped him, and once carried him away when wounded by Diomedes, while the god Poseidon, though hostile to Troy, saved him from Achilles.

306. Many cities allied to Troy were raided by Achilles. In Thebes in Cilicia he killed King Eëtion, father of Hector's wife Andromache, while Great Ajax raided the Thracian Chersonesus and in Teuthrania killed the King Teuthras and took his daughter Tecmessa.

307. In the tenth year of the war the Greeks at last concentrated their armies before Troy itself, which was defended by the mighty Hector, by Æneas, and by many allies, including Sarpedon, a son of Zeus, who was in command of the Lycians.

308. The Greeks were hampered by rivalries between the chiefs. Odysseus took a cruel revenge on Palamedes, who had tricked him into joining the forces. He bribed one of Palamedes' servants to hide under his master's bed a letter written in the name of Priam, and then accused Palamedes of treachery. Palamedes' tent was searched, the letter was found, and he was stoned to death by the whole army. Thus perished the sage, who was said to have invented lighthouses, scales, measures, the discus, certain letters of the alphabet, and dice.

309. Then in the tenth year there broke out the notorious quarrel between Achilles and Agamem-

non with which the *Iliad* opens. Chryseis, the daughter of the Trojan priest, Chryses had been taken prisoner and assigned to Agamemnon, and when Chryses came to ransom her, Agamemnon roughly repulsed him. Apollo, in revenge, sent a plague among the Greeks, and on Calchas' advice, Agamemnon unwillingly sent Chryseis back. He recompensed himself, however, by seizing Briseis, who had been given to Achilles, and Achilles then stubbornly refused to take any further part in the fighting, though some say that his motive in this was to curry favour with Priam, for he had fallen deeply in love with Priam's daughter Polyxena.

310. The Trojans quickly seized this opportunity to attack, and Agamemnon was glad to grant a truce so that Paris and Menelaus might settle the quarrel by a duel. But when Paris was losing, Aphrodite carried him away and fighting broke out again.

311. Diomedes wounded Æneas and Aphrodite and then strove with Glaucus, a Lycian prince second in command to Sarpedon, but when they remembered the friendship between their forefathers they desisted and exchanged gifts. Hector and Ajax fought in single combat till nightfall, when they also exchanged gifts, Hector giving Ajax a sword and receiving a purple baldric.

312. The Greeks, hard-pushed, were now forced to build a wall and trench, and when they were driven back even farther, Agamemnon in alarm offered to return Briseis to Achilles, but he courteously and firmly refused.

313. Diomedes and Odysseus then made a night-raid on the Trojan lines. After killing the spy, Dolon, they slew Rhesus the Thracian and drove off his snow-white horses, for an oracle had declared that once they had drunk of Scamander, and eaten the grass of the Trojan plain, the city would not be taken. The play *Rhesus*, attributed to Euripides, dramatises these incidents from the *Iliad*.

314. Next day, however, the Trojans victoriously set fire to the very ships, and Achilles went so far as to lend Patroclus his own armour and let him lead the Myrmidones. After killing Sarpedon, Patroclus drove the Trojans back to their very walls, until he was at last himself wounded by Euphorbus, son of Panthous, and slain by Hector, who at once stripped him of his borrowed armour, though Menelaus, who had killed Euphorbus, now joined with Ajax in rescuing the body.

315. Achilles was prostrate with grief, but Thetis visited him with new armour made by Hephæstus, and he made peace with Agamemnon, who at last sent Briseis back. Achilles then drove the terrified Trojans back to the city. The noble Hector alone withstood him, though Priam and Hecuba, implored him to come in. Thrice did Achilles chase Hector round the walls of Troy, and then finally killed him, stripped him of his armour, and, tying him by the ankles to his chariot, dragged him ignominiously back to the ship, though some say that Achilles dragged Hector three times round the walls of Troy by the purple baldric that Great Ajax had given him.

316. Each day at dawn Achilles, crazed with grief, pulled the corpse three times round the tomb of Patroclus until at last, in one of the most touching scenes of the *Iliad*, Priam, led by Hermes, went to Achilles' tent and begged to ransom his son's body for burial.

317. The lovely Penthesilea now came to the Trojans' aid. She was the daughter of Otrere and Ares, and Queen of the Amazons. But Achilles killed her, and as he mourned over her, he was ridiculed by Thersites, the ugliest and most scurrilous of the Greeks, and Achilles felled him with a blow. This angered Diomedes, a kinsman of Thersites, and he flung the body of Penthesilea into the Scamander, but it was rescued and honourably buried, some say by Achilles himself.

318. Memnon the black-skinned, handsome son of Eos and Priam's half-brother Tithonus, and King of Ethiopia, now reinforced the Trojans. He killed several Greeks, including Antilochus, the gallant son of Nestor, who, too young to sail from Aulis, joined his father later.

319. The vengeful Achilles then engaged Memnon in fierce single combat while Zeus weighed their fates in the balance. Memnon was slain and, at the request of Eos, Zeus honoured him by causing birds, called Memnonides, to rise from his funeral pyre and fight above it till they fell as a sacrifice. They were said to visit yearly the hero's tomb on the Hellespont.

320. Many great monuments, called Memnonia, were supposed by the Greeks to have been erected in Memnon's honour, the most famous being the colossal statue behind the temple of Egyptian Thebes, which gave forth each sunrise a sound like the breaking of a lyre-string.

321. Achilles' own course was now run, and in a battle near the Scæan gate Paris, aided by Apollo, shot him through the vulnerable ankle.

322. Great Ajax then killed Glaucus, and he and Odysseus rescued the body of Achilles. But they quarrelled violently over the possession of the armour. Homer, in the *Odyssey*, says that Odysseus killed Ajax, and that when he summoned the spirits of the dead, Ajax held sullenly aloof. Sophocles, however, in his tragedy *Ajax*, represents Ajax thrown into madness by defeat and slaying the sheep of the Greeks, believing them to be his rivals, and finally falling on the very sword that Hector had given him.

323. So many heroes dead, the Greeks lost heart, and Calchas said they must fetch the bow and arrows of Heracles. Odysseus and Diomedes therefore sailed to the island of Lemnos, where Philoctetes had been left to languish, and Sophocles, in his play *Philoctetes*, shows how he was persuaded to return.

324. Cured of his wound by one of the sons of Asclepius, either Machaon or Podalirius, Philoctetes challenged Paris to an archery contest. Mortally wounded, Paris besought his former lover Œnone to cure him, but she refused, and then in remorse at his death took her own life, events described by Tennyson in his *Death of Œnone*.

325. Helenus and Deiphobus now quarrelled for the possession of Helen, now homesick for Sparta, and when Deiphobus forcibly married her, Helenus, as some say, fled to Mt. Ida, where either he freely joined the Greeks, or was captured or ensnared by Odysseus, for Calchas had said that only Helenus knew the secret oracles which protected Troy. Helenus said it would fall that summer, if a bone of Pelops were brought to the Greeks, if Achilles' son Neoptolemus, or Pyrrhus, joined them, and if Athene's Palladium were stolen from the citadel.

326. Agamemnon at once sent for the shoulder-blade of Pelops, while Odysseus, Phœnix, and Diomedes went to Scyros and persuaded Lycomedes to let Neoptolemus join them. Odysseus then gave Neoptolemus his father's armour.

327. It is said that Priam now sent Antenor to Agamemnon to sue for peace, but Antenor, out of hatred for Deiphobus, conspired with the Greek leader as to how they might secure the Palladium. They arranged that Odysseus, disguised as a filthy runaway slave, should gain entrance to Troy. Recognised by Helen alone, he gained much useful information, including the confession that she longed to return home. It was either on this occasion that he stole the Palladium, or later when he was accompanied by Diomedes.

328. Odysseus is said to have devised the stratagem of the wooden horse. This was built by the cowardly Epeius, son of Panopeus, under the supervision of Athene, and it bore an inscription

saying that it was dedicated to the goddess. Then twenty-three or more of the bravest Greeks, including Neoptolemus, Odysseus, Sthenelus, and Thoas of Calydon, climbed into the hollow belly.

329. At nightfall, Agamemnon and the remaining Greeks burnt their camp and sailed to the island of Tenedos, leaving behind only Sinon, a cousin of Odysseus and grandson of the cunning Autolycus.

330. At dawn Priam and his sons found the wooden horse on the shore, and believing it to be sacred to Athene, had it hauled in spite of opposition up to the citadel. Cassandra declared that warriors were within it, and she was supported by Laocoön, son of Antenor, and priest to both Apollo and Poseidon, who flung a spear at the horse's flank and caused a clatter of arms. Their warning was, however, neglected, partly because Sinon, who had let himself be taken prisoner, said that the horse was the Greeks' atonement for stealing the Palladium, partly because the fate which now befell Laocoön was misinterpreted.

331. Laocoön had offended Apollo by marrying in spite of vows of celibacy, and the god now punished him by sending two enormous serpents, which crushed to death both the priest and his two sons—a disaster represented in the magnificent sculpture probably dating from the first century B.C. and now in the Vatican. Priam wrongly supposed this to be a punishment for smiting the horse, and it was now welcomed with feasting and revelry.

332. In the evening Helen with Deiphobus strolled round the horse and, imitating in turn the voice of each man's wife, she called to the heroes, who stifled their replies.

333. At night Agamemnon, warned by a beacon lit by Sinon, sailed to the shore, and as Antenor gave the word the warriors within the horse leapt down to slaughter and pillage.

334. Priam had been persuaded by Hecuba to take refuge with her and her daughters before an altar to Zeus, but their son Polites was slain before their very eyes by Neoptolemus, and when the old king feebly tried to attack the slayer, Neoptolemus butchered him also. Odysseus and Menelaus meanwhile killed and mangled Deiphobus, but Menelaus pardoned Helen, and led her safely to the ships.

335. Cassandra fled to the sanctuary of Athene, but Little Ajax roughly dragged her away, and she was claimed as booty by Agamemnon. Her sister Laodice, the wife of Helicaon, was mercifully swallowed up by the earth.

336. Hector's widow Andromache was given to Neoptolemus, and the Greeks, eager to exterminate the whole family of Priam, even killed her infant son Astyanax, by hurling him to death from the city walls, fearful lest he should one day avenge his parents.

337. At the demand of Achilles' ghost Polyxena was sacrificed to him by Neoptolemus, to ensure favourable winds. Some say this happened at Troy, others only when the Greek fleet had reached Thrace.

338. Hecuba fell to the share of Odysseus, who took her to the Thracian Chersonesus, and there she avenged the death of one of her sons. Polydorus, the youngest of Priam's sons, had, according to Homer, been slain by Achilles, but later accounts speak of another son of the same name. Just before the fall of Troy Priam had entrusted him, together with much gold, to Polymester, King of the Thracian Chersonesus, and when Troy fell Polymester murdered Polydorus for his gold and cast him into the sea. Hecuba discovered the body. She contrived to kill Polymestor and his two sons, and she then evaded the angry Thracians by turning herself into a bitch named Mæra.

339. Euripides combined this story of Hecuba's revenge with that of the sacrifice of her daughter Polyxena in his tragedy *Hecuba.*

340. Few of the inhabitants of Troy escaped death or slavery. The wise Antenor, his wife Theano, and their children were all spared, and were said to have sailed to the West Coast of the Adriatic and there to have founded Venice and Padua.

341. Æneas' carried on his back his blind father Anchises through the Dardanian gate and so to safety. The Romans said that he took with him the Palladium, that stolen by Odysseus being only a replica, and, after seven years' wandering, reached Latium, where he founded Lavinia, and became their ancestral hero.

342. Æthra, the mother of Theseus, who had served Helen as a slave, was rescued by her grandsons, Acamas and Demophon, the sons of Theseus and Phædra.

THE [illegible]NS FROM TROY.

343. Part of the ancient "Epic Cycle" of the Greeks was the cycle known as "The Returns," which was used both by Homer and Æschylus. It told of the adventures of the Greeks on their way home. Most suffered misfortune.

344. The fate of Agamemnon is described in para. 386–388, and that of Odysseus in para. 353–369.

345. Menelaus, who failed to sacrifice to Athene, took eight years, and only by seizing Proteus learned how to reach Sparta, where he married Hermione to Neoptolemus.

346. Neoptolemus had been accompanied by Andromache and by Helenus, who prophesied a safe route. He had abandoned his kingdom in Thessaly and settled in Epirus, part of which he gave to Helenus, who married Andromache. Neoptolemus then claimed Hermione, although her grandfather, Tyndareus, had betrothed her to Orestes, and as a result he was murdered, either by Orestes himself or at his instigation.

347. Many Greeks settled in Italy. Diomedes, hated by Aphrodite, finding on his return to Argos that his wife had been unfaithful, left for Ætolia to help his grandfather Œneus, and later settled in Daunia in Italy, where he married Euippe, daughter of King Daunus. He was buried in one of the islands since called Diomedans, and his companions were turned into gentle birds. Philoctetes also settled in Italy.

348. Idomeneus, caught by tempest on his return to Crete, vowed to sacrifice to Poseidon the first person he met on return. As this was his own son, Crete was punished by pestilence, and Idomeneus exiled. He settled in Calabria in Italy.

349. Demophon, son of Theseus visited Thrace and gained the love of the king's daughter, Phyllis, but when he left her to visit Athens, she killed herself in despair of his return and was turned into a tree.

350. Many sailors were ship-wrecked on the dangerous promontory of Caphareus, where Nauplius, King of Eubœa, eager to avenge the death of his son Palamedes, lighted misleading fires.

351. The seer, Calchas, like Amphilochus, went safely overland to Colophon. Here he contended in prophecy with Mopsus, a son of Apollo and Manto, the daughter of Teiresias, and being surpassed, he died of grief. Amphilochus joined with Mopsus in founding the city of Mallus, but they killed each other in a fight for its possession.

352. Nestor alone returned home without mishap and enjoyed a happy old age.

THE WANDERINGS OF ODYSSEUS 353–369.

353. Odysseus' journey home, lasting ten years, and his final arrival in Ithaca are the theme of Homer's epic the *Odyssey*. E. V. Rieu says that this may be thought of as a novel, and Samuel Butler argued that it might well have been written by a woman! The incidents of the *Odyssey* form the background of reference to the *Ulysses* of James Joyce.

354. After leaving Troy, Odysseus and his men visited the Cicones, where he obtained several jars of sweet wine, and then they landed on the Libyan promontory of the Lotophagi. Here lived the Lotus-eaters, who gave his men some of the fruit, inducing the enervating dreaminess described by Tennyson in *The Lotus-eaters*.

355. Next, landing on the west coast of Sicily, Odysseus, with twelve companions, entered the cave of a giant, but when the owner, the one-eyed Cyclops, Polyphemus, son of Poseidon, came in with his flocks, he blocked the entrance with a gigantic stone, and devoured two of Odysseus' companions. Next evening, by which time only six of his men survived, Odysseus made Polyphemus drunk with his sweet wine and then blinded him. At dawn the Greeks escaped by clinging under the bodies of the sheep as they went out to graze, and so reached their ship, but henceforth they had to reckon with the vengeful hostility of Poseidon.

356. Odysseus was next entertained by Æolus, who gave him a bag of winds, but when his foolish crew untied this, they were blown back to Æolus, who now refused further help.

357. In Telepylos, city of Lamus, King of the cannibal Læstrygones, Odysseus lost all his ships except one, but in this he reached Ææa, the island of the enchantress Circe, daughter of Helios and Perse. Men sent by Odysseus to explore were turned by her to swine, and only Eurylochus returned to tell the news. Odysseus, hastening to their rescue, was given, by Hermes, the plant Moly, which vanquished Circe's charms. She restored his companions and lavishly entertained them all for a year.

358. Then, on Circe's advice, Odysseus sought the counsel of the dead seer Teiresias. He sailed to the River Oceanus, and in the land of the Cimmerians summoned the spirits of the dead, who thronged to lap the blood of a libation he had prepared. First appeared Elpenor, one of his crew, who while drunk had fallen to death from Circe's roof. Later came Teiresias, who gave him prophetic advice, and then Anticleia, the mother of Odysseus, the men and women of antiquity, and his former comrades.

359. He again visited Circe, who advised him how to circumvent the Sirens and Scylla and Charybdis. Odysseus nullified the Sirens' spell by having himself lashed to the mast, and by filling the sailors' ears with wax, and he just avoided the whirlpool Charybdis, though Scylla's six mouths snatched and devoured as many of his seamen.

360. At the island of Thrinacia, against the warnings both of Teiresias and Circe, Odysseus' companions slaughtered the cattle of Helios, and when they put to sea Zeus destroyed all save Odysseus himself.

361. Clinging to wreckage, he drifted ten days until he reached the island of Ogygia. Here the nymph Calypso lovingly kept him for eight years, until at Athene's request Zeus sent Hermes to command his release.

362. On a raft that Calypso had taught him to make, Odysseus sailed for eighteen days, till it was wrecked by vengeful Poseidon. Then helped by Leucothea and Athene, Odysseus landed on the island of Scheria. Here he was led by the beautiful Nausicaa to the Court of her father Alcinous, who was the prosperous ruler of the Phæacians. Alcinous gave Odysseus a ship, and after an absence of ten years he at last landed on Ithaca. Athene disguised him as a beggar and he was hospitably welcomed by his swineherd Eumæus.

363. Odysseus' mother Anticleia had died of grief, Lærtes his father had withdrawn to the country, and his wife Penelope had been keeping at bay a crowd of unruly suitors led by Antinous. She had promised to wed one of them when she had finished a robe for Lærtes, but each night she unpicked the work of the day, until her servants betrayed her ruse, and she was now hard-pressed. Her son Telemachus had gone in search of Odysseus, and after visiting Nestor and Menelaus, he now returned to Ithaca and also visited the hut of Eumæus.

364. Here Odysseus made himself known to Telemachus and they planned revenge. First the son set out for home, followed later by Odysseus still in beggar's disguise. He was recognised only by his aged hound Argus, which at once expired, and by his nurse Eurycleia.

365. Next day Penelope announced that she would accept the suitor who could shoot with the great bow of Eurytus which only Odysseus had been able to wield. No one could bend it till Odysseus seized it and shot Antinous. Supported by Telemachus, he killed the suitors, and at last made himself known to Penelope. He then visited Lærtes, but the kinsmen of the suitors rose against him and battle ensued until Athene, disguised as Mentor effected a reconciliation.

366. At this point the *Odyssey* ends, though Teiresias had prophesied that Odysseus must again set out on a journey and propitiate Poseidon and then return to an honourable old age till death came to him from the sea.

367. Tennyson, in his poem *Ulysses*, imagines him, even in age, hungry still for travel.

368. Another tradition says that Telegonus, son of Odysseus by Circe, while searching for his father, landed on Ithaca and began to plunder for food. When opposed by Odysseus and Telemachus, all unknowing he killed his father. He then took Telemachus and Penelope back to Ææa, and there married Penelope, while Telemachus married Circe.

369. Although Homer represents Penelope as a faithful wife, other writers say that she became the mother of Pan, either by Hermes or by all the suitors. It is a tradition such as this that Joyce evidently follows in his *Ulysses*.

LEGENDS OF THE HOUSE OF PELOPS, 370–398.

370. Some of the most dramatic of all Greek stories have their setting in Mycenæ, city of the legendary hero Agamemnon. In 1876 Schliemann began excavation on this ancient site, and here he unearthed the famous shaft-graves with their precious treasures, which probably date from 1600 B.C., four centuries before the era of Agamemnon and the siege of Troy. Schliemann thus proved to the learned world that the city at all events was historical, and scholars now believe that it was the centre of a Late Bronze Age culture.

371. According to legend, Agamemnon was a descendant of Tantalus, son of Zeus and the nymph Pluto and father of Pelops, Broteas, and Niobe. Tantalus was said to be a wealthy king, but whether of Lydia, Argos or Corinth, is uncertain.

372. Highly favoured by his father Zeus, Tantalus was even invited to Olympian banquets, but he proved unworthy of such honours, divulging Zeus' secrets and stealing nectar and ambrosia from Olympus.

373. Tantalus was also said to have received from Pandareus a dog made of gold, and then to have sworn by Zeus that he had never seen or heard of it. As this dog was the one which Hephæstus had made for Rhea, and which she had set to watch the cradle of the infant Zeus, the gods were naturally incensed. Pandareus perished miserably, and his orphan daughters were carried off by Harpies, and Tantalus suffered agonising punishment for this and other crimes, the most ghastly of which was his murder of his son Pelops. Having invited the gods to a banquet, he cut Pelops into pieces and served them in a stew. Demeter, still grieving for Persephone, was the only divinity who did not notice what she was eating, and she consumed the shoulder.

374. Tantalus' punishment became proverbial. Tortured with thirst, he was placed in a lake whose waters receded whenever he attempted to drink, while above his head were laden fruit boughs which flew upwards as soon as he reached for them. Thus "tantalised," he also saw suspended above his head a huge rock which threatened to fall and crush him.

375. After punishing Tantalus, Zeus ordered Hermes to put the limbs of Pelops into a cauldron and boil them. Clotho took him from the cauldron, Demeter gave him an ivory shoulder, which became a kind of birthmark for his descendants, and Pelops was restored to life.

376. Pelops was later expelled from his kingdom of Phrygia and came with his followers to Pisa in Elis. Here Œnomaus, son of Ares, was king, and as an oracle had said that he would be killed by his son-in-law, he challenged to a chariot race all who came to woo his daughter, Hippodameia. If the young man won, he would marry Hippodameia, if not he would be killed by the spear of Œnomaus, which, like his wind-begotten horses, was a gift of his father Ares.

377. Many suitors had lost their lives when Pelops arrived in Pisa. He was already possessed of a winged golden chariot, the gift of Poseidon, but he also bribed Œnomaus' charioteer Myrtilus, the son of Hermes, with the promise of half the kingdom, to remove the lynch-pin from the chariot of his master and substitute one of wax. Œnomaus was flung out and killed, and Pelops married Hippodameia.

378. Pelops refused to keep faith with Myrtilus and flung him into the sea. Myrtilus, as he died, cursed the whole race of Pelops, and his image was set among the stars as the charioteer by his father Hermes. Pelops soon became master of Olympia and revived the Olympic Games. His wealth and power in the peninsula were so great that it was called the Peloponnesus, or "Island of Pelops."

379. The eldest sons of Pelops, Atreus and Thyestes, with the connivance of their mother, killed Chrysippus, their half-brother, and were obliged to flee their home.

380. They were kindly received at Mycenæ, and after the death of King Eurystheus, Atreus seized the kingdom in spite of the bitter rivalry of Thyestes, whom he forthwith banished.

381. Thyestes, however, who had already succeeded in seducing Atreus' second wife Ærope, now tricked his brother into killing Pleisthenes, his own son by his first wife. Atreus, planning grisly reprisals, lured Thyestes to Mycenæ by promising him half the kingdom. He then killed the sons of Thyestes and served him their flesh at a banquet. When the horror-stricken father realised what he had eaten, he laid a curse on the house of Atreus and fled once more.

382. Thyestes, seeking revenge, was advised by the Delphic Oracle to beget a son by his own daughter, and going to King Threspotus at Sicyon, where his daughter Pelopia was a priestess, he ravished her and fled.

383. Atreus now visited Sicyon, and, believing Pelopia to be a daughter of Threspotus, married her as his third wife. When she gave birth to Thyestes' son, Ægisthus, she exposed the baby, but Atreus, believing Ægisthus to be his own child, took him in and reared him.

384. When later Thyestes was seized and brought back to Mycenæ, Atreus commanded Ægisthus to slay him, but Thyestes disarmed the boy, and recognising him as his own son, ordered him to kill Atreus. Then, at last, Thyestes ruled in Mycenæ.

385. According to Homer, Atreus had two sons by Ærope, Agamemnon and Menelaus, and these two now took refuge with King Tyndareus of Sparta. Here Menelaus married Helen, daughter by Zeus of Tyndareus' wife, Leda, and some say that Agamemnon was helped by Tyndareus to expel Thyestes and gain his father's throne.

386. Agamemnon's wife was Clytemnestra (the daughter of Tyndareus and Leda), whom he forcibly married after killing her first husband in battle. But when his brother's wife, Helen, was stolen away by Paris, and the Trojan War broke out, Agamemnon was away fighting for ten years, and it was not difficult then for Ægisthus to seduce Clytemnestra.

387. Not only had Agamemnon forcibly married Clytemnestra, but he had also agreed to the sacrifice of their daughter, Iphigeneia at Aulis, and her cup of bitterness was full when she learned that he was returning from Troy, bringing with him Priam's daughter, the prophetess Cassandra, as his mistress.

388. It is at this point that Æschylus' great trilogy of the *Oresteia* begins. Clytemnestra conspired with Ægisthus to kill both Agamemnon and Cassandra. She welcomed her husband royally on his return, but while he was in his bath entangled him in a net, and after Ægisthus had twice struck him, she beheaded him with an axe. She then went out to kill Cassandra, who had refused to enter the palace because, in visionary trance, she was horrified to smell the ancient shedding of blood and the curse of Thyestes (*see para.* 381).

389. It was not difficult now for Clytemnestra to seize power, for Orestes, her young son, had been smuggled out of Mycenæ by his sister Electra, and for many years Clytemnestra and her paramour ruled in Mycenæ.

390. Ægisthus, however, lived in constant fear of vengeance. He would have killed Electra had Clytemnestra allowed, so he married her to a peasant, who was fearful of consummating their union. Orestes meanwhile had taken refuge with Strophius, King of Phocis, who had married Agamemnon's sister, and here he formed that friendship with the king's son, Pylades, which became proverbial.

391. The intensely dramatic situation at this point has inspired all three of the great Greek tragedians, and it is most interesting to compare the various interpretations given by Æschylus, in *The Libation Bearers*, the second play of his trilogy, by Sophocles, in *Electra*, and by Euripides, in *Electra*.

392. Electra, burning for revenge, sent constant messages to Orestes, and when he and Pylades were of age they came secretly to Mycenæ, and with Electra's help killed both Ægisthus and Clytemnestra.

393. The agonising punishment that Orestes now endured is portrayed in the *Eumenides*, the last play of Æschylus' trilogy, and in the *Orestes* of Euripides. Although the Delphic Oracle had encouraged Orestes to avenge his father, she was powerless to prevent his being pursued by the Erinnyes, the avengers of matricide, who drove him mad and hounded him from land to land. At length, on the further advice of the Pythian Priestess, he reached Athens and embraced the image of Athene in her temple on the Acropolis. The goddess then summoned the Areopagus to

judge his case. Apollo defended him against the Erinnyes on the grounds that motherhood is less important than fatherhood, and he was acquitted by the casting vote of Athene, the verdict being a triumph for the patriarchal principle.

394. The furious Erinnyes were then pacified by Athene, who persuaded them to accept a grotto in Athens, where they would be offered sacrifices, libations, and first fruits. Their name henceforward was Eumenides, or the "well-meaning."

395. According to another tradition, followed by Euripides, in his *Iphigeneia Among the Taurians*, Orestes was told by Apollo that he would be freed from madness by fetching the statue of Artemis from the Tauric Chersonese.

396. When Orestes and Pylades reached Tauris they were seized by the barbarous natives, who sacrificed all strangers to Artemis, but they found to their amazement that the priestess was none other than Orestes' own sister Iphigeneia. Orestes believed that she had lost her life when sacrificed to Artemis at Aulis (as is described in para. 300), but she had in fact been rescued by the goddess and brought to Tauris as her priestess.

397. Iphigeneia, by her ready wit, rescued Orestes and Pylades from sacrifice, and all three returned to Greece, carrying with them the image of the goddess. Here they were reunited with Electra, and returned to Mycenæ, where Orestes, by killing Ægisthus' son and becoming king, finally ended the strife between the sons of Atreus.

398. Orestes, after killing his rival Neoptolemus, married his cousin Hermione, and Electra was married to Pylades.

THE UNDERWORLD, 399–409.

399. The Greeks expected to enter after death into the cheerless nether world, the domain of Hades, known to the Romans as Orcus, or Dis, but as Hades was possessor of all the rich metals and gems of the earth, the ancients usually preferred the euphemism "Pluto," "the wealth," when speaking of one so dreaded.

400. The word "Hades" was used too of his actual domain, which was also called Tartarus, although in the *Iliad*, the word "Tartarus" had been reserved for the very lowest region of the Underworld, where the rebel Titans had been thrust.

401. Hades, son of Cronus and Rhea, won the lordship of the nether world when his brother Zeus won the sky, and Poseidon the sea. His most treasured possessions were the helmet of darkness, given him by the Cyclopes, and the staff with which he drove the ghosts.

402. He ruled with his queen, Persephone, whom he had forcibly abducted from the upper world, but he was not always faithful to her, and she once changed the nymph Minthe, whom he was pursuing into the plant mint, and the nymph Leuce, whom he loved, was afterwards changed into the white poplar.

403. The companion to Persephone was Hecate, who had once aided Demeter in her search for the lost maiden. Hecate was a mysterious divinity, a triple goddess, mighty in heaven, on earth, and in the Underworld, honoured by Zeus and all the immortal gods. She came to be regarded by the Hellenes as primarily a dread divinity of the Underworld, as one who kept company with the dead and who fostered sorcery and witchcraft. She figures as such in *Macbeth*. Worshipped where three roads met, she was represented with three bodies and three heads.

404. Also dwelling in the Underworld were the Erinnyes, winged daughters of earth or of night, with serpent hair, who punished unnatural crime. They were later known euphemistically, as the "Eumenides," or "well-meaning," and this name was said to have been given them after the acquittal of Orestes, as is portrayed in the *Eumenides* of Æschylus. Late writers named three Erinnyes, Alecto, Megæra, and Tisiphone.

405. Ghosts conducted to Hades' realm by Hermes had first to cross the Styx, the "hated" river, and supplied by relatives with a coin laid under the tongue of the corpse, they paid the surly ferryman Charon. Without this coin they were unable to cross the Styx. Arrived on the farther bank, they propitiated Cerberus, represented by later writers as a fierce dog with three heads, said to be another of the monsters born to Echidne.

406. Styx was not the only river ghosts encountered. There was also Acheron, river of woe, Phlegethon, river of flames, Cocytus, river of wailing, and Lethe, the river of forgetfulness, where ghosts drank and forgot their past.

407. The three judges of the Underworld were Æacus, Rhadamanthus, and Minos. Wicked spirits were sent by them to the place of punishment, those who had led an indifferent life to the cheerless asphodel fields, and the virtuous to Elysium.

408. Although Elysium was said to be near the Underworld, it formed no part of Hades' dominion, and Homer placed it far away to the west of the earth, near Oceanus. It was a blessed abode, without cold or snow. Later writers also spoke of the "Fortunate Isles," located by Greek geographers as beyond the pillars of Heracles, and eventually identified with the Canary and Madeira islands.

409. In their picture of life after death the Greeks combined contradictory ideas. Broadly speaking, the figures of Persephone and Hecate represent the hopes of pre-Hellenic people for an after-life, while Hades personifies the Hellenic fear of the finality of death.

PART III. INDEX AND GLOSSARY

Note: The numbers in this part refer to the numbered paragraphs in Part II.

Abas. (1) *Son of Celeus and Metanira, turned by* Demeter into a lizard because he mocked her when she drank too eagerly. *See also* 118.
(2) The grandson of Danaus and twelfth King of Argolis, was renowned for his sacred shield, the very sight of which subdued revolt. He was father of the twins Acrisius and Prœtus.

Abderus, 180.

Absyrtus (or **Apsyrtus**), 159.

Abyla, 182.

Academus, 215.

Acamas, a son of Theseus and Phædra, went with Diomedes to Troy to demand the surrender of Helen. *See also* 211, 342.

Acastus was the son of Pelias, King of Iolcos. He joined the Argonauts, but after Medea had caused the death of Pelias, Acastus banished her and Jason. He later received Peleus kindly, but when he falsely suspected his guest of making love to his wife, he treacherously deserted him. Acastus and his wife were later slain by Peleus. The daughter of Acastus was Laodamia.

Arachne, a Lydian maiden who challenged Athene to compete with her in weaving. When Athene found Arachne's work faultless, she angrily tore it up, and the terrified maiden hanged herself. Athene then turned her into a spider and the rope into a cobweb.

Arcas, son of Zeus and Callisto, who was supposed to have given his name to Arcadia.

Aria, the mother of Miletus by Apollo.

Arion. (1) An actual historical character was a lyric poet and player on the lyre, who lived at the Court of Periander of Corinth at about 625 B.C. The following curious fable is told of him. On one occasion Arion visited Sicily and won the prize in a musical contest. Laden with gifts, he took ship for Corinth, and the captain and crew decided to murder him for his treasure. They gave him permission to sing one last song. Arion then invoked the gods, and leapt into the sea. Here he was rescued by one of the music-loving dolphins that had gathered to hear his song, and taken on its back to Corinth, where he told Periander of his adventures. Later, when the ship arrived, the captain and crew swore that Arion had been detained in Sicily. Periander then confronted them with Arion himself and had them executed. The images of Arion and his lyre were set among the stars.
(2) A fabulous horse, 103.

Aristæus was the son of Apollo and Cyrene, born in Libya. He went to Thrace and fell in love with Eurydice, who, fleeing from him, perished by a snake bite. As a punishment Aristæus lost his bees, and how he raised a new swarm is told in Virgil's fourth *Georgics*. After death was worshipped as a god.

Asclepius or **Æsculapius** was a son of Apollo by Coronis. He was brought up by Cheiron, who taught him healing. He once recalled a dead man to life and was killed by Zeus with a thunderbolt. At Apollo's request, however, he was placed among the stars. Another tradition says that Asclepius was a native of Epidaurus. In Homer he was not a god, but the "blameless physician," father of Machaon and Podalirius, physicians to the Greek Army. His supposed descendants were the Asclepiadæ, a caste of priests who transmitted from father to son the knowledge of medicine as a sacred secret. Epidaurus was the centre of Asclepius' worship. Cocks were sacrificed to him and serpents sacred.

Asopus, a river god, son of Oceanus and Tethys, and father of Evadne, Eubœa, and Ægina.

Astræus, a Titan, was father, by Eos, of the beneficent winds and, some say, of the stars also.

Atalanta. (1) The Arcadian Atalanta, daughter of Iasus and Clymene, was exposed by her father and suckled by a bear. She always carried arms. She joined the Calydonian hunt and bore a son, Parthenopæus, to Meleager. Reconciled to her father, she refused to marry unless a suitor should conquer her in a foot race, those who failed in the attempt being killed by her. Eventually Milanion outstripped Atalanta by dropping in her way one after the other, three golden apples given him by Aphrodite. Atalanta stopped to gather these and lost the race. *See also* 263.
(2) The Bœotian Atalanta was said to be daughter of Schœneus and to have married Hippomenes, but the same tales are told of her. See Swinburne's play *Atalanta in Calydon* and the poem *Atalanta's Race*, by William Morris.

Athamas, was the son of Æolus and King of Orchomenus in Bœotia. At Hera's command he married Nephele, and had children Phrixus and Helle. But Athamas secretly loved Ino, daughter of Cadmus and Harmonia, who bore him Learchus and Melicertes. Deceived by Ino's intrigues, Athamas would have sacrificed Phrixus, had not a ram with a golden fleece, sent by Hermes, rescued the boy and flown through the air with him and his sister Helle. Between Europe and Asia, Helle fell into the straits since called Hellespont, but Phrixus reached Colchis, where he sacrificed the ram to Zeus and gave the fleece to Æëtes, from whom it was later carried off by Jason. Meanwhile Athamas, driven mad by Hera because he had sheltered Dionysus, killed his son Learchus, and Ino flung herself into the sea with Melicertes, where both were transformed into marine deities. Ino became Leucothea, and Melicertes changed to Palæmon. Athamas, forced to flee, settled in Thessaly. *See also* 120.

Atlantis was a legendary island, west of the Pillars of Hercules. Its virtuous and powerful inhabitants, becoming degenerate, were defeated by the Athenians, and the island was swallowed up by the ocean in a day and night. *See* the *Timæus* of Plato.

Atlas, the son of Iapetus and Clymene, was father of the Pleiades, Hyades, and Hesperides. *See also* 7, 9, 16, 91, 138, 183.

Atropos, one of the Fates.

Bacchæ, 117, 123. Also called Bacchantes, Mænads, or Thyiads.

Bacchus, a name for Dionysus, 117–128.

Bassareus was an epithet of Dionysus. "Bassaris" was a fox-skin which was worn by the god and also the Mænads in Thrace. Hence Bassaris means Mænad or Bacchante.

Belus, son of Poseidon and father of Ægyptus, Danaus, and Cepheus.

Bias, brother of Melampus.

Biton and Cleobis, sons of a priestess of Hera at Argos, in their filial devotion once dragged their mother's chariot to the temple. Their mother prayed Hera to grant them the best gift for mortals, and they both died while asleep in the temple.

Boreas, the North wind, was the son of Astræus and Eos, and brother to the other beneficent

winds—Notus, Eurus, and Zephyrus. He carried off Oreithyia, daughter of Erectheus, who bore him twin sons, Zetes and Calais, and the daughters Chione and Cleopatra (the wife of Phineus). Boreas was friendly to the Athenians and destroyed the ships of Xerxes.

Bosphorus, 157.

Brauron, 86.

Briareus, one of the Hecatoncheires, 1, 32.

Briseis, 309, 312, 315.

Britomartis, 81, 229.

Bromius, 117.

Brontes, 1.

Broteas, 371.

Butes, son of Pandion, King of Athens, was a priest of Pallas Athene.

Cacus, 182.

Cadmea, 242, 243, 250.

Cadmus, 158, 240, 241, 242, 243, 244, 245, 246, 247, 252.

Caduceus, 98.

Cæneus, offspring of Elatus, was originally the nymph Cænis, beloved by Poseidon, who had consented to change her to a man. Cæneus accompanied the Argonauts and helped to hunt the Calydonian Boar. Although invulnerable, he was killed by the Centaurs in the battle with the Lapithæ, for they buried him under a mass of trees. His soul flew out as a bird, and in the Underworld he regained female form.

Calais, *see* Zetes.

Calchas, 293, 300, 309, 323, 325, 351.

Calpe, one of the pillars of Heracles, 182.

Calliope, the Muse of epic poetry, is represented with a tablet and stylus and sometimes with a roll of paper or a book.

Callirrhoë, 271.

Callisto, daughter of Lycaon, was one of Artemis' huntresses. She was seduced by Zeus, who tried to deceive Hera by turning her into a bear. Hera, discovering the ruse, contrived that Artemis should hunt Callisto down, but Zeus caught her up and set her image among the stars as Arctos. Some say that Artemis herself in anger turned Callisto into a bear; others that she was pursued by her own son Arcas and that Zeus snatched both to heaven, Callisto becoming the Great Bear and Arcas the Little Bear.

Calypso, 361, 362.

Capaneus, 263, 265, 267, 268.

Capricorn, 6.

Cassandra, 277, 283, 330, 335, 387, 388.

Cassiopeia, 139, 140.

Castalian Spring, 69.

Castalides, the Muses.

Castor, one of Dioscuri, 155, 167, 215, 285, 286.

Caucasus, 17.

Cecrops was said to be the first king of Attica, and to have founded Athens. *See also* 204, 206.

Celeus, 113.

Centaurs in Homer appear as savage creatures, but in later accounts are described as having the upper part of the body human, the lower part equine. They were said to be the offspring of Ixion and a cloud. They lived on Mt. Pelion in Thessaly, a district famous for hunting the bull on horseback. On one occasion they fought with Heracles (*see* 176), but their most celebrated fight was that with the Lapithæ (*see* 212). Wisest of the Centaurs was Cheiron.

Centimani, 1.

Cephalus had married Procris, but Eos, who fell in love with him, revealed that Procris was easily seduced by gold. Procris then fled in shame to Crete, where she was seduced by Minos. She later returned to Athens, disguised as a youth and bringing a hound and spear, the gifts of Artemis, that never missed their quarry. Cephalus so coveted these, that husband and wife became reconciled. Procris, however, suspected him of loving Eos, and jealously watched him while hunting. One day Cephalus accidentally killed her with the unerring spear.

Cepheus. (1) Son of Aleus, and one of the Argonauts, was King of Tegea in Arcadia, but he and most of his sons were killed while helping Heracles against Hippocoon. *See also* 191.
(2) King of Æthiopia, 139, 140.

Cerberus (and Heracles), 184, 405.

Cercyon was the son of Poseidon or Hephæstus. He lived near Eleusis, where he killed all travellers by challenging them to a wrestling-match, but was himself overcome and killed by Theseus. *See also* 205.

Ceres, Roman counterpart of Demeter, 110–116.

Ceryneian Hind, 175.

Ceto, 134.

Ceyx, *see* Alcyone.

Chaos, 1.

Charis, 55.

Charities or **Graces**, were called Gratiæ by the Romans. At first the Greeks personified one Grace only—Charis, who in the *Iliad* appears as the wife of Hephæstus. Later the Greeks spoke of three Graces, Euphrosyne, Aglaia, and Thalia, daughters of Zeus. They were especially the friends of the Muses, living with them on Mt. Olympus.

Charon, 405.

Charybdis, *see* Scylla *and* 359.

Cheiron or **Chiron** was the wisest and best of all the Centaurs. He was the son of Cronus and Philyra, and was hence called Philyrides, and lived on Mt. Pelion. Taught by Apollo and Artemis, he was skilled in music, medicine, prophecy, hunting, and gymnastics, and taught many of the heroes of antiquity, such as Jason, Castor and Pollux, Peleus, and Achilles. Heracles accidentally caused his death (*see* 176), and Zeus placed his image among the stars as Sagittarius.

Chimæra, 147, 148, 255.

Chione. (1) The daughter of Oreithyia and Boreas and mother by Poseidon of Eumolpus, hence called Chionides.
(2) Mother of Autolycus by Hermes. She was killed by Artemis.

Chiron, *see* Cheiron.

Chrysaor, 108, 137.

Chryseis, 309.

Chrysippus, 379.

Chthonius, one of Sparti, 243.

Cicones, 354.

Cilix, 225.

Cimmerians, 358.

Circe, 160, 357, 358, 359, 360, 368.

Ciris, 230.

Cithæron was a lofty range of mountains between Bœotia and Attica, sacred to Dionysus and the Muses. Pentheus and Actæon were killed there. *See also* 168.

Cleobis, *see* Biton.

Cleonæan (or **Nemean**) **Lion**, 173.

Clio, the Muse of History, represented with a roll of paper or a chest of books.

Clotho, one of the Fates, 375.

Clymene. (1) Mother of Phæton by Helios.
(2) Wife of Iapetus.

Clytemnestra, 287, 386, 387, 388, 389, 390, 392.

Cnidos, 116.

Cnossos, 30, 220.

Cocalus, 238.

Cocytus, 406.

Colchis, 154, 157.

Colonos, 260.

Core, the Maiden, 39, 111.

Corinth, 45, 58, 102, 105, 118, 146, 148, 161.

Cornucopia, 6.

Coronis, 74.

Corybantes, priests of Rhea in Phrygia noted for their dances to drums and cymbals.

Cottus, one of the Hecatoncheires.

Chimæra, 147; Nemean Lion, 173; Lernean Hydra, 174; Orthrus, 182; Ladon, 183; Sphinx, 255; Cerberus, 184, 405. Her mate was Typhon. She was killed by Argus.

Echion. (1) Son of Hermes, took part in the Calydonian hunt and was herald to the Argonauts.

(2) One of the Sparti, 243, 246.

Echo was a nymph who diverted Hera's attention with incessant talking while Zeus amused himself with the nymphs. When Hera discovered the trick she took from Echo all use of her voice except in repetition of another's speech. Echo then fell in love with Narcissus, a beautiful youth, who repulsed her, and she pined away in grief until only her voice remained. Artemis, in anger at Narcissus' coldness, caused him to fall in love with his own reflection in a fountain. In despair he took his own life and was turned into the flower.

Edones, 122.

Eëtion, 306.

Elatus, one of the Lapithæ, and father of Cæneus.

Electra. (1) The Pleiad, 274.

(2) Daughter of Agamemnon and Clytemnestra, 389, 390, 392, 397, 398.

"Electra" of Euripides, 391.

"Electra" of Sophocles, 391.

Electryon, King of Mycenæ, was the son of Perseus and Andromeda. His daughter Alcmene married Amphitryon.

Eleusis, in Attica, had a splendid temple of Demeter, 112, 113, 114.

Elpenor, 358.

Elysium, 407, 408.

Empusæ, daughters of Hecate, were horrible demons, with the haunches of asses and wearing brazen slippers. They could disguise themselves as bitches, cows, or maidens, and in the latter shape they would lie with men asleep and suck their strength till they died. The idea of Empusæ was probably brought from Palestine, where the Lilim, or daughters of Lilith, had similar characteristics.

Enceladus, 11, 12.

Endymion, King of Elis, was a beautiful Æolian youth, who, while sleeping in a cave on Carian Mt. Latmus, was seen by Selene the moon, who came down and kissed him. He afterwards returned to the cave and fell into a dreamless sleep. By his wife he had four sons, one of them being Ætolus, who conquered the land now called Ætolia. The myth probably indicates the fate of one who marries the moon Goddess. See Keats's *Endymion.*

Enipeus was the river god loved by Tyro.

Enna, 112.

Eos, in Latin Aurora, was the Dawn, daughter of Hyperion and Theia. She drove her chariot each morning to announce the approach of her brother Helios, and, as Hemera, accompanied his across the sky to arrive with him in the West in the evening as Hespera. Her husband was Astræus, said by some to be father by her of the stars and all winds save the East. Eos carried off several beautiful youths, including Orion, Cephalus, and Tithonus. Her son by Tithonus was Memnon. Eos asked Zeus to grant Tithonus immortality, but omitted to ask also for perpetual youth. Tithonus therefore shrank away until he became a cicada. Among Greeks in Asia Minor the golden cicada was an emblem of Apollo the sun god.

Epaphus, son of Zeus and Io, reigned over Egypt, and was rumoured to be the sacred bull, Apis.

Epeius, 328.

Ephesia (Artemis Ephesia), 81.

Ephesus, 87, 88.

Ephialtes, 11, 13.

Epigoni, 268, 269.

Epimetheus, 16, 17, 20.

Erato, the Muse of erotic poetry and mime, sometimes carries a lyre.

Erebus, or darkness, son of Chaos, begot Æther and Hemera by his sister Night. *See also* 25.

Erichthonius. (1) Son of Hephæstus. Athene entrusted to the daughters of King Cecrops of Athens a chest which they were forbidden to open. It concealed the infant Erichthonius. According to one version, the daughters (Agraulos, Pandrosos, and Herse) were overcome with curiosity and opened the chest. Seeing a serpent within it, they leapt in madness from the Acropolis to their death. Erichthonius succeeded Cecrops as King of Athens, and was himself succeeded by Padion.

(2) Erechtheus the second was grandson of Erechtheus, son of Hephæstus, and the son of Pandion, whom he succeeded as King of Athens. He was father by Praxithea of four sons, including Cecrops, and seven daughters, Protogonia, Pandora, Procnis wife of Cephalus, Creusa, Oreithyia, Chthonia, and Otionia. When the Eleusinians under Eumolpus son of Poseidon attacked Athens, Erechtheus was told to sacrifice Otionia, whereupon her two eldest sisters, Protogonia and Pandora, also sacrificed themselves. Erechtheus slew Eumolpus, whereupon Poseidon demanded vengeance, and either he or Zeus slew Erechtheus.

Eridanus was a river god. Phæthon fell to his death here. Because amber was found here Eridanus was later supposed to be the Po.

Erigone, *see* Icarius.

Erinnyes or Eumenides, 3, 260, 271, 393, 394, 404.

Eriphyle, 262, 269, 271.

Eris, 65, 280.

Eros, who in Latin was named Amor or Cupid, was said to be the son of Aphrodite by either Ares, Hermes, or her own father Zeus. The early Greeks thought of him as a winged "sprite," but by the fifth century B.C. he was represented as a boy, irresponsible but lovely, flying on golden wings and carrying in his golden quiver arrows which could wound both men and gods, and torches. He was sometimes portrayed as blindfolded. He usually accompanied his mother Aphrodite. *See also* **Psyche.**

Erymanthian Boar, 176.

Erysichthon, son of Triopas, dared to cut down trees in a grove sacred to Demeter, and when he ignored protests she punished him with an insatiable hunger.

Eryx, Mt., 58.

Eteocles, 257, 261, 265.

Etna, Mt., 12.

Euippe. (1) The daughter of Cheiron, being with child by Æolus, son of Hellen, was changed into a horse. Their child was Melanippe.

(2) The daughter of Daunus, 347.

Eumæus, 362, 363.

Eumenides or Erinnyes, 3, 260, 271, 393, 394, 404.

"Eumenides," the play by Æschylus, 393, 404.

Eumolpus, "the good singer," was the son of Poseidon and Chione, the daughter of Boreas and Oreithyia. His mother threw him into the sea as soon as he was born, but his father Poseidon cared for him. He was brought up in Ethiopia, and lived later at the Court of King Tegyrius of Thrace, and then came to Eleusis in Attica. Here he became the priest of the mysteries of Demeter and Persephone. He initiated Heracles into the mysteries and taught him to sing and play the lyre. Eumolpus led an expedition against Erectheus of Athens, three of whose daughters sacrificed themselves to ensure victory. Eumolpus was killed by Erectheus, who was then himself slain by either Poseidon or Zeus. Eumolpus' descendants became hereditary priests of Demeter at Eleusis.

Eunomus, 193.

Euphorbus, 314.

Euphrosyne, one of the Charities or Graces.

Euridice, *see* **Orpheus.**

Euripides, 123, 161, 185, 200, 211, 246, 263, 267, 313, 339, 391, 393, 395.

Europa, 223–224, 244.

Eurus, son of Astræus and Eos, was the South-east wind.

Euryale, 134, 138.

Euryalus, 288.

Eurycleia, 364.

Eurylochus, 357.

Mimas, 11.

Minerva, Roman counterpart of Athene.

Minoan Tradition, 6.

Minos, 220, 222, 224, 225, 227, 228, 229, 230, 231, 233, 237, 238, 239, 407.

Minotaur, 222, 233, 234, 235.

Minthe, 402.

Minyans, 99, 100, 110, 169.

Mnemosyne or "Memory" daughter of Uranus, 25.

Mœræ or **Moiræ**, *see* Fates *and* 25.

Moly, 357.

Mopsus, 351.

Musæ or **Musagetes**. The Muses were divinities presiding over the arts and sciences. They were daughters of Zeus and Mnemosyne, and were born at Pieria near Mt. Olympus. Their worship spread from Thracia and Pieria into Bœotia, where they dwelt on Mt. Helicon, with its sacred fountains of Aganippe and Hippocrene. Mt. Parnassus and its Castalian Spring were also sacred to them. Libations of water or milk and honey were offered to the Muses. Originally three in number, they were afterwards spoken of as nine, Clio of history, Euterpe of lyric poetry (or of music), Thalia of comedy, Melpomene of tragedy, Terpsichore of choral dance and song, Erato of erotic poetry and mime, Polymnia, or Polyhymnia, of the sublime hymn, Calliope of epic poetry, and Urania of astronomy.

Mycenæ, 143, 144, 370, 380, 381, 384, 389, 392, 397.

Myrmidones, 293, 314.

Myrtilus, 377, 378.

Mysia, 156.

Naiades or **Naiads**, the nymphs of fresh water, 156.

Narcissus, *see* Echo.

Nauplius, 350.

Nausicaa, 362.

Naxos, 13, 124.

Neleus was twin brother of Pelias (*see* 108, 152, 153). Driven from Iolcus by Pelias, he went with Melampus and Bias to Pylus, where he became king. He had twelve sons. *See also* 190, 191.

Nemean Lion, 173.

Nemean Games, 173.

Nemesis, who was said to be a daughter of Oceanus, was a goddess who originally measured out to men happiness and misery, chastening those who were over-fortunate. Later she came to be thought of as one who punished crime. She had a shrine at Rhamnus in Attica. The wheel which she habitually carried was probably in origin a symbol of the solar year, according to whose seasons the sacred king was fated to rise to the height of his fortune or to die.

Neoptolemus or **Pyrrhus**, 295, 325, 326, 328, 334, 336, 337, 345, 346, 398.

Nephele, a phantom created by Zeus to deceive Ixion, became the wife of Athamas.

Neptune, *see* **Poseidon**.

Nereides or **Nereids**, daughters of Nereus, nymphs of the Mediterranean, 109, 139.

Nereus, 106.

Nessus, 194, 196.

Nestor, 190, 287, 295, 318, 352, 363.

Niobe, 82, 250, 251, 371.

Nisus, 230.

Nisyrus, 12.

Nomius, the Pasturer, a name given to gods, such as Apollo, Hermes, Pan, who protect pastures.

Notus, called Auster by the Romans, was the South-west wind. He was a son of Astræus and Eos.

Nymphæ were lesser deities which peopled all parts of nature.

Nysa, Mt., 120, 123.

Oceanides, nymphs of the ocean, daughters of Oceanus.

Oceanus, 1, 3, 7, 25, 358.

"**Odyssey**," 60, 322, 353–366.

Odysseus, 289, 290, 291, 295, 301, 302, 308, 313, 322, 323, 325, 326, 327, 328, 329, 334, 338, 344, 353–369.

Œbalus. (1) King of Sparta and father of Tyndareus, Hippocoon, and Icarius.

Œdipus, 252–261.

"**Œdipus at Colonos**," 260.

"**Œdipus Tyrannus**," 260.

Œneus, King of Pleuron and Calydon in Ætolia, married Althæa and was father of Tydeus, Meleager, Gorge, and Deianeira. His realm was ravaged by the Calydonian Boar, and was later seized by his nephews, but his grandson Diomedes, son of Tydeus, avenged him and put Gorge's husband Andræmon on the throne. Œneus accompanied Diomedes to the Peloponnesus, where he was eventually killed by two nephews who had escaped Diomedes' vengeance. *See also* 192, 261.

Œnomaus, 376, 377.

Œnone, 278, 324.

Ogygia, 361.

Oileus, King of the [illegible]ians, was one of the Argonauts, 292.

Olympia, 27.

Olympic Games, founded by Heracles, 190, 378.

Olympius, a name for the Muses and all the gods who were supposed to live in Olympus and not in the lower world.

The twelve great Olympian gods in some places worshipped as a body were Zeus, Poseidon, Apollo, Ares, Hermes, Hephæstus, Hestia, Demeter, Hera, Athene, Aphrodite, and Artemis. At a later date Dionysus became one of the great twelve, in place of Hestia.

Olympus, Mt., 14, 27, 47, 51, 52, 53, 54, 66, 118, 150, 372.

Omphale, 95, 187, 188.

Omphalos, 76.

Opheltes was the son of King Lycurgus of Nemea. The Nemean games were founded in his honour, but Heracles re-dedicated them to Zeus.

Orchomenus was the capital of the Minyans of Bœotia, 169.

Orcus, 399.

Oreades were the nymphs of mountains and grottoes.

"**Oresteia**" of Æschylus, 388.

Orestes, 346, 389, 390, 392, 393, 395, 396, 397, 398, 404.

"**Orestes**" of Euripides, 393.

Orion, a son of Poseidon was a giant hunter and exceedingly handsome. He fell in love with Merope, the daughter of Œnopion of Chios. Œnopion promised Merope to Orion if he would free the island of wild beasts. When he failed to keep his promise Orion seduced Merope, and was blinded by Œnopion, who was helped by his father Dionysus. An oracle told Orion that he would regain his sight if he travelled East and exposed his eyeballs to the rising sun. He went to Lemnos, where Hephæstus lent him a guide to the East. There Eos fell in love with him, and her brother Helios restored his sight. Orion later joined Artemis as a hunter, boasting that he would kill all the wild animals. Apollo, hearing this and fearing that Artemis also might fall in love with Orion, cunningly contrived that the goddess should accidentally kill him. After his death Orion's image was set among the stars, where he appears as a giant with "belt and sworded hip." The story of his blindness cured in the East is a myth of the sun, on whose rising the animals retire to their dens.

Oreithyia, daughter of Erectheus, carried away by Boreas.

Orpheus, the son of King Œagrus and Calliope, received a lyre from Apollo and was taught to play by the Muses, so that he was able to enchant beasts, trees, and rocks to follow his music. On returning from his voyage with the Argonauts (*see* 155), he married Eurydice, and when she died from a snake bite, he followed her

to the Underworld. Here his music delighted even Hades, so that he allowed Eurydice to follow her husband back to life, provided only that he did not look round. On the very threshold of life Orpheus anxiously looked back, and so lost Eurydice. He was so desolate with grief that the jealous Thracian women tore him to pieces in an orgy of Dionysus, a god whom he had neglected to honour. The Muses collected the fragments of his body, which were buried at the foot of Olympus, but his head, thrown into the River Hebrus, was carried still singing down to sea and on to Lesbos, whither his lyre also drifted, to be placed later as a constellation in the heavens at the intercession of Apollo and the Muses.

The Greeks considered Orpheus to be the greatest poet before Homer, and fragments of poetry extant were ascribed to him.

The religion "Orphism" was characterised by a sense of sin and the need for atonement, the idea of a suffering man-god, and a belief in immortality. It had an influence on such philosophers as Pythagoras and Plato, and formed a link between the worship of Dionysus and Christianity.

Palæmon, a sea-god, originally Melicertes, son of Athamas and Ino.

Pan, the misshapen god with goat feet, horns, and tail, was said by some to be an ancient divinity coæval with Zeus, though most reported him to be the son of Hermes. He was the god of shepherds and flocks, living in rural Arcadia, hunting and dancing with the nymphs. He would also lurk in forests, startling travellers with a sudden shout and filling them with "panic." Pan loved many nymphs, including Syrinx, who fled in terror and was metamorphosed into a reed, from which Pan made the syrinx (or Pan's pipe) that he was said to have invented, for his love of music was well known. He was also said to have seduced Selene. The Olympians looked down on Pan as a rustic, uncontrolled divinity. He is the only god whose death was reported. The worship of Pan began in Arcadia, which was despised by the Greeks for its backwardness. It did not reach Athens till early in the fifth century B.C. The Romans later identified Pan with Faunus. *See also* 14, 77–97, 369.

Pandion, King of Athens, was son of Erichthonius and father of Procne, and Philomela, and of Erechtheus, who succeeded him.

Pandrosos, daughter of Cecrops. To her and her sisters, Erichthonius was entrusted.

Parnassus, Mt., a lofty mountain range north-west of the Gulf of Corinth. The name was usually limited to the two-peaked summit north of Delphi, above which the Castalian spring issued. The mountain was one of the chief seats of Apollo and the Muses, and was also sacred to Dionysus. *See also* 20, 69, 7.

Peleus, son of Æacus, King of Ægina, joined with his brother Telamon in killing their half-brother Phocus. Expelled by Æacus, he went to Phthia in Thessaly, where he was purified by the king's son Eurytion, but accompanying Eurytion to hunt the Calydonian Boar, he accidentally killed his benefactor. Peleus now fled to Acastus, King of Iolcos, who purified him, but here he was falsely accused by Acastus' wife. Acastus then took Peleus on a hunting expedition on Mt. Pelion, and while his guest was asleep secreted his sword and deserted him. Peleus would have been killed by Centaurs had not Cheiron rescued him. Zeus now decided to give to Peleus the Nereid Thetis as wife. Zeus himself would have married her had he not been warned by Themis that she would bear a son more illustrious then his father. Cheiron told Peleus how to master Thetis by holding her fast whatever form she might assume, and all the divinities save Eris came to the wedding. She in revenge cast in the golden apple, which caused, eventually, the Trojan War. Thetis bore to Peleus the hero Achilles, whose death he survived. *See also* 280, 293, 296.

Pelides, the son of Peleus, that is Achilles.

Peneus, a god of the River Peneus in Thessaly, son of Oceanus and Tethys and father of Daphne and Cyrene.

Periclymenus, the Argonaut was the son of Neleus and brother of Nestor. Though he could assume what shape he chose, he was killed by Heracles.

Periphetes, a monster at Epidaurus who used to kill passers-by with an iron club. He was killed by Theseus.

Pero, daughter of Neleus and Chloris and wife of Bias.

Persë, daughter of Oceanus and wife of Helios, by whom she became the mother of Æëtes, Circe, Pasiphaë, and Perses.

Perses, son of Helios and Persë and father of Hecate.

Phæthon, "the shining," was a son of Helios by Clymene. He gained his father's permission to drive the chariot of the sun, but his incompetence provoked Zeus to kill him with a thunderbolt, and he fell into the River Po. His mourning sisters were turned into alder- or poplar-trees, which wept tears of amber. Phæthon's fate may represent the ritual death of the boy interrex for the sacred king, who ruled for one day and was then killed, usually by horses.

During the Bronze Age amber, sacred to the king, was carried from Baltic to Mediterranean via the Po valley.

Phalanthus, a mythical Spartan said to have founded Tarentum in Italy about 700 B.C.

Pheræ was an ancient town in Thessaly, the home of Admetus.

Pheres, son of Cretheus and Tyro, was the father of Admetus and Lycurgus and the founder of Pheræ in Thessaly.

Philemon, an old man of Phrygia who, with his wife Baucis, hospitably received Zeus and Hermes.

Philoctetes, 198, 301, 303, 323, 324, 347.

"Philoctetes" of Sophocles, 323.

Philomela, *see* **Tereus.**

Phineus was the son of Agenor and ruled in Salmydessus in Thrace. He imprisoned his sons, by his first wife, Cleopatra, because of a false accusation made by their stepmother, Idæa. For this, or some other fault, he was punished with blindness, and two Harpies tormented him. When the Argonauts reached Thrace, Zetes and Calais, brothers of Cleopatra, killed the Harpies and were also said to have vindicated and freed their nephews, the sons of Phineus. In return, he advised Jason what course to take (*see* 157). Milton compares himself to Phineus (*Paradise Lost*, Book III, lines 35, 36).

Phlegethon, 406.

Phlegeus, 271.

Phocis, a country in Northern Greece, its chief mountain Parnassus and its chief river Cephissus, 390.

Phocus, son of Æacus, killed by his half-brothers Telamon and Peleus.

Phœbe, a name of Artemis as goddess of the moon.

Phœbus, 69.

"Phœnician Maidens, The," 263.

Phœnix, 294, 296, 361.

Pholus, a Centaur, 176.

Phorcys, a sea-deity, was, by Ceto, the father of Ladon, Echidne, the three Gorgons, and the three Greæ.

Phoroneus, son of Inachus and the nymph Melia, was an early mythical King of Argos.

Phrixus, son of Athamas and Nephele.

Phrygia, 121.

Phylachus, father of Iphiclus.

Phyleus, son of Augeias, 177.

Phyllis, beloved by Demophon, 349.

Pieria, on the south-east coast of Macedonia, was inhabited by Thracian people, who in early times worshipped the Muses, hence called Pierides. *See also* 92.

Pierides. (1) The Muses.
(2) The nine daughters of Pierus, a king in Macedonia, named after the Muses. They were conquered in a contest with the Muses and turned into birds.

Pirene, 148.

Pirithous, the son of Ixion and Dia, was King of the Lapithæ in Thessaly. He became a close friend of Theseus. *See also* 212, 213, 214.

Pisa, in Elis, 376, 377.

Pittheus, King of Troezen, was son to Pelops and father of Æthra, 203.

Pleiades, daughters of Atlas and Pleione were companions of Artemis. They were changed into doves and placed among the stars.

Pleione, mother by Atlas of the Pleiades.

Pleisthenes, 381.

Pluto. (1) A name for Hades, 399.
(2) The nymph, 371.

Podalirius, 324.

Podarces. (1) Original name of Priam, 275.
(2) Son of Iphiclus, who led the Thessalians against Troy.

Pœas, 301.

Polites, 334.

Pollux, Roman name for Polydeuces.

Polybus, 253.

Polybutes, 11, 12.

Polydectes, 132, 133, 141.

Polydeuces, one of Dioscuri, 155, 157, 215, 285, 286.

Polydorus. (1) Son of Cadmus and Harmonia, 244, 252.
(2) Son of Priam, 338.

'olyeidus, 232.

Polymester, 338.

Polymnia or **Polyhymnia**, the Muse of the sublime hymn.

Polyneices, 257, 261, 262, 263, 265, 266, 269.

Polypemon, *see* **Procrustes** *and* 205.

'olyphemus, 355.

'olyxena, 309, 337, 339.

'ontus, 1.

'orphyrion, 11.

Poseidon, *see especially* 99–109 *and also* 7, 9, 10, 13, 32, 36, 42, 44, 60, 67, 73, 110, 134, 137, 139, 140, 152, 157, 211, 223, 227, 305, 330, 348, 362, 366, 377.

Praxitiles, 63.

Priam, 275, 276, 277, 282, 302, 309, 315, 316, 318, 327, 330, 331, 334, 336, 338.

Priapus, son of Dionysus and Aphrodite, a god of fruitfulness.

Procne, *see* **Tereus.**

Procris was the daughter of the second Erectheus to be King of Athens. She married Cephalus. *See also* 229.

Procrustes or the "Stretcher" was the surname given to the robber Polypemon. He used to tie travellers to a bed, and if they were too short he would rack them, and if too tall, he would hack off their legs. He was served in the same way by Theseus. *See also* 205.

Prœtus, son of Abas, King of Argolis, inherited the kingdom jointly with his twin brother Acrisius. Soon expelled, he fled to Iobates, King of Lydia, whose daughter Anteia, also called Stheneboea, he married. Returning to Argolis, he forced his brother to divide the kingdom and became ruler of Tiryns, whose massive walls he built by aid of the Cyclopes. *See also* **Melampus, Bellerophon.**

Prometheus, 16–20, 41, 176, 183.

Protesilaus, 303.

Proteus was the prophetic old man of the sea, subject to Poseidon, whose flocks of seals he tended. By assuming any shape he chose, he could avoid the need of prophesying, unless gripped fast, when he would at last resume his usual shape and tell the truth. He could be found at midday in the island of Pharos. *See also* 183, 345.

Psamathe, *see* **Linus** (1).

Psyche appears in late Greek literature as a personification of the soul, purified by suffering to enjoy true love. The beauty of the maiden Psyche excited the envy of Aphrodite who sent Eros to persecute her, but he fell in love with her and secretly visited her nightly. When Psyche, urged by her two sisters, sought to discover his identity, he left her. Searching for Eros, she endured further persecution, but he secretly helped her, and she finally overcame Aphrodite's hatred, to become immortal and united with Eros for ever. The story is told in *The Golden Ass* of Apuleius.

Pygmalion of Cyprus is said to have fallen in love with the ivory image of a maiden that he himself had made, and to have prayed Aphrodite to breathe life into it. When she consented, Pygmalion married the maiden, whom he called Galatea. By her he became the father of Paphus and Metharme. It is probable that the story concerns a priest of Aphrodite at Paphus who kept the image of the goddess in order to retain power. See William Morris's version in *The Earthly Paradise.*

Pylades, 390, 392, 396, 397, 398.

Pylos, 92.

Pyrrha, 20, 21.

Pyrrhus, *see* **Neoptolemus.**

Pythia, 76, 118, 171.

Pythian or **Pythius**, 69.

Python, 71, 76.

THE CONTEMPORARY THEATRE

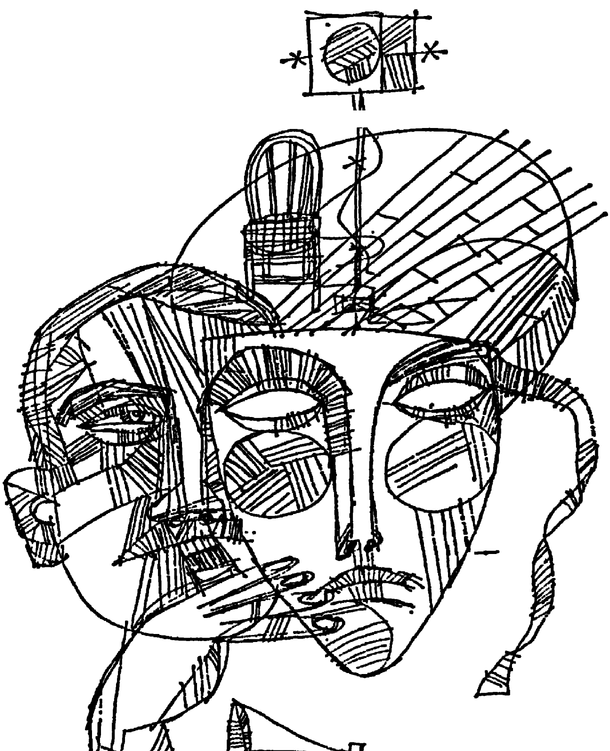

TABLE OF CONTENTS

THE CONTEMPORARY THEATRE

This section concerns the English theatre since 1950 and is confined to plays produced before a live audience. It consists of four sections:

I. Introduction
II. Eminent Theatrical Groups
III. Glossary of Dramatic Terms
IV. Directory of Dramatists

I. INTRODUCTION

What significance can the modern audience be expected to find in such spectacles as squalid garrets and basements, characters most unrealistically bursting into song, old tramps changing hats, a young man trying to teach a set of weighing-machines to sing the Hallelujah Chorus, or three children continuously re-enacting the ritual murder of their parents?

These are some of the questions that trouble the playgoer, and since they are not always easy to answer it may be helpful first to consider what is the function of dramatic art, what are its constituents and background, and how to judge a play.

The Function of Dramatic Art.

It is not the function of art to make a statement but to induce an imaginative response, and the spectator receives not an answer to a question but an experience.

Drama, like the other arts, gives expression to that subtle and elusive life of feeling that defies logical definition. By feeling is to be understood the whole experience of what it feels like to be alive—physical sensations, emotions, and even what it feels like to think.

This flux of sensibility cannot be netted down in logical discourse, but can find expression in what Clive Bell, when discussing the visual arts called " significant form."

The contemporary philosopher, Susanne Langer, in her book, *Feeling and Form*, has developed Clive Bell's concept, arguing that all artistic form is an indirect expression of feeling. The artist, be he painter, poet, or dramatist, creates an image, a form that gives shape to his feeling, and it is for the sensitive recipient to interpret its significance.

The especial province of drama, as was pointed out by Aristotle, is to create an image, an illusion of action, that action " which springs from the past but is directed towards the future and is always great with things to come." Both tragedy and comedy depict such action and the conflict which it normally entails.

The Therapeutic Effect of Drama.

One of the achievements of serious drama is to create an image that will objectify and help to resolve deep human conflicts.

Most people have at some time or another come away from a fine play feeling in some inexplicable way exhilarated and released, and it has long been recognised that drama can have a beneficial, even a therapeutic effect.

It is not difficult to understand the exhilarating effect of comedy, but more difficult to understand that of tragedy. In the 4th century B.C. Aristotle claimed that tragedy accomplishes a beneficial purgation of pity and terror and very recently Miss Bradbrook has attempted a psychological explanation of the effect of serious drama on the audience. She suggests that in watching a mature play we are encouraged to sympathise with many different characters at one and the same time, and it may be that the imaginative effort entailed has a corresponding movement in the unconscious mind. There, at the most primitive level, is an " internal society," the petrified infantile images of father, mother, and siblings, to which we are linked by inflexible attitudes. It may be that the sympathetic response to the playwright's images of these figures helps us to relax our rigid attitudes towards them so that the internal pattern of relationships shifts, and we experience a sense of release and a new access of energy.

It is noteworthy also that drama can be fully appreciated only in a public performance, a social event demanding the co-operation and understanding between author, players, and audience. Because it can flourish only in a community, normally a city, it has been called the metropolitan art.

The Constituents of Drama.

Drama is a complex art in that it uses two very different kinds of ingredient or material, one speech, the literary constituent, the other the gesture, movement, and confrontation of actors on an actual stage. Speech is man's most precise, subtle, and mature means of expression. Gesture and confrontation, which he shares to some degree with animals, is more primitive and some of the power of drama as an art form is its fusion of civilised speech and primitive gesture into one organic whole.

It is just possible to conduct brief scenes using only one of these media. The chorus in Shakespeare's *Henry V* is virtually confined to speech and there is in Galsworthy's *Justice*, revived in 1968, a remarkable wordless scene, showing a criminal in solitary confinement in his cell, that proved so moving that it is reputed to have led to an amendment of the penal code.

Perhaps the more primitive gesture has the greater emotional force, but it is the words made permanent in the literary script that up till now have constituted the commanding form of drama. Even the wordless mime is given permanence by the printed script.

The Ritual Element.

While speech and the confrontation of actors are essential to full drama, there is an element that has sometimes been neglected and that is ritual, perhaps the most primitive and evocative of all. The early tragedy of Greece was probably organically connected with the religious ritual of Dionysus and the matrix was song and dance. Similarly in England the origins of drama are to be found in church liturgy and ritual and civic occasion, both of which used procession, pageantry, costume, and symbolic insignia to great effect and also clowning which served as comic relief to the solemnity.

There have naturally been few drama
have been able to combine literary ability, a sense

of stage situation and also skill in the use of ritual process. The enduring power of Shakespeare is due to his manifold genius in that he could deploy inimitable poetry, swift action, and such ritual enrichments as royal processions, crowning and dethroning, duelling and wrestling, masque and pageantry, song and dance.

The Background of Modern Drama.

The happy fusion of both literary and theatrical excellence which is to be found in Shakespeare's plays is extremely rare, for it demands not only a versatile genius but also a receptive audience and a suitable building. By the Restoration the delicate balance was already disturbed and by the middle decades of the 19th century popular taste had all but banished literature from the stage. The disorderly audiences of the time demanded only spectacular and sensational theatrical and musical effects, and in the vast monopoly theatres of Drury Lane and Covent Garden they could hardly have heard, let alone appreciated, good dialogue. The managers discouraged men of genius, so that poets like Browning, who had no practical knowledge of the theatre, produced wordy "closet dramas," which were virtually unactable, while the popular theatrical melodramas like *Maria Marten* or *Murder in the Red Barn*, are today unreadable.

With the gradual establishment of smaller theatres, catering for a sober middle-class audience, men of talent again began to write for the stage. It was the turn of literature to take command, and more popular and traditional techniques such as music and clowning were now banished to the music-hall and pantomime.

T. W. Robertson, Henry Arthur Jones and Pinero all furthered the trend towards realism but it was the genius of Ibsen, especially in such works as *Ghosts* and *The Wild Duck*, that set a high standard of excellence for the literary and realistic play of middle-class life. He expressed his profound insight into personal and social problems in finely constructed plays, written in naturalistic prose, the overtones of poetic universality being conveyed in symbolism that was usually verbal.

Able writers, like Granville Barker and Galsworthy, although they lacked the poetic power of Ibsen, firmly established in England a similar type of literary play, realistic, well-constructed, serious-minded, concerned with the middle class and almost exclusively verbal.

Some of the few exceptions to this preoccupation with the realistic and literary are to be found in Shaw. Like Shakespeare, he was not only a literary genius. He was also well acquainted with stage-production and although much too wordy in old age, in his best comedies he combined some of the wittiest dialogue to be found in English drama along with the delightful shocks and surprises of total theatre. Androcles' engaging Lion belongs to the same family as Titania's Ass and Whittington's Cat.

But Shaw in his prime was unique, and between the wars the verbal, realistic play was perpetuated by such writers as Maugham and Coward. Not over-concerned with psychological or social issues, they used it to portray the leisured classes.

By the 'forties the conventional West End play had with a few exceptions come to imitate not life but photography. Confined to the proscenium arch and realistic to the last trivial detail, it presented a prosaic picture of middle- and upper-class life, with stereotyped situation, demanding only stock responses and lacking interest in ideas, poetic intensity, and genuine wit. With the star cast and the long commercial run, theatre-going had become not an artistic experience but a social occasion.

Apart from the novel comedies of such writers as Ustinov and Rattigan and the verse plays of T. S. Eliot and Fry, it was the revivals of the classics, English and European, that were bringing genuine drama to the stage. Shakespeare could be enjoyed not only at Stratford and the Old Vic, but in the West End. It was largely due to Gielgud that Shakespeare was now a box-office draw.

Gielgud's fine histrionic sense, and his highly sensitive and poetic interpretation had earned him that rare distinction of being the Hamlet of his generation and as early as 1934 his production and performance at the New Theatre had broken all records since Irving.

As actor and producer, working with other fine artists, such as Edith Evans, Peggy Ashcroft, Olivier, Guinness and Scofield, Gielgud later confirmed his success. Enthralling interpretations of plays by Shakespeare, Webster, Otway, Congreve, Sheridan, Wilde and Chekhov demonstrated that the classics could have a wide popular appeal.

Other artists followed and in a successful season at the New Theatre, Sybil Thorndike, Olivier and Richardson played to crowded houses in *Oedipus*, *Henry IV*, *The Critic* and *Peer Gynt*.

Such achievements have reminded audience and aspiring playright that there are many other dramatic styles than that of fashionable realism and so may even have helped to further the dramatic revival that began in the 'fifties.

The Modern Revival.

It is not easy to identify the causes of this revival, but undoubtedly one reason is that young playwrights like Wesker and Delaney have injected new vigour into the jaded realistic mode by using it to express the vital stresses and conflicts of the working people whom they know. Hence the settings in basement and attic. *See* Neo-realism.

More far-reaching is the general awareness among *avant-garde* playwrights that verbalism is not enough and their readiness to experiment with the resources of "total theatre." Here the way has been shown by scholarly research into the history of the theatre which has given men confidence to revive valid techniques such as song, music and clowning that the early 20th century had exiled to the music-hall.

The most vital stimulus has been the challenge of genius. Brecht's Epic Theatre (*q.v.*) has offered a more free and fluid form than that of the "well-made play," and his novel uses of traditional theatrical devices (such as song, masks, extravagant costume and settings, direct address to the audience) have been quickly adapted by dramatists like Arden, Bolt, and Osborne.

Meanwhile Ionesco, whole-hearted devotee of the Theatre of the Absurd (*q.v.*), has introduced monsters like the rhinoceros and has exploited stage properties like empty chairs to satirise man's empty existence. He has soon been followed by Saunders and by Simpson, whose weighing-machines symbolise the dominance of imagination by machinery. Monsters and machinery recently restricted to pantomime are returning to the stage.

A most pervasive influence has been that of Artaud's demand for a Theatre of Cruelty (*q.v.*). This is both the most novel and the most atavistic type of theatre, for it attempts to re-create in modern terms that primitive, even barbaric ritual from which drama evolved. In England it is best known still in translation of Genet, Weiss, and Triana.

Another interesting aspect of theatre today is a new and highly topical interpretation of Shakespeare, for some critics and producers have traced in his plays the bleak disenchantment that is typical of post-war Europe.

Peter Brook has said that his fine production in 1963 of *King Lear*, with Paul Scofield as protagonist, owed much to the critic Jan Kott, a Polish Professor of Literature, whose book *Shakespeare our Contemporary*, was published here in the following year.

Kott, who lived through the Nazi tyranny and the Stalinist occupation of Poland, urges that the power-politics, chicanery and violence of twentieth century Europe have their counterpart in the Wars of the Roses and the Tudor disturbances. He finds in Shakespeare's Histories and in the Tragedies, especially *Macbeth*, what he terms the "Grand Mechanism" of history, the blood-stained struggle for power with its terrible consequences, and he claims that Shakespeare "condemns war by showing up the Feudal butchery."

The series, "The Wars of the Roses," which was produced for the B.B.C. during 1965–6 by Peter Hall and John Barton with the Royal Shakespeare Company, vividly demonstrated the crime-ridden lust for power and the feudal butchery. Meanwhile at Stratford and the Aldwych, the production of *Henry V* neglected the traditional, royal splendour and showed the king, grimy and battle-scarred, leading a tattered army, plagued by corrupt camp-followers. Played on a bare, gaunt stage, grey, metallic and cavernous, it was strikingly similar in tone and significance to Brecht's *Mother Courage*, running concurrently at the Old Vic.

New Perspectives.

Since 1965 there have been further attempts at new kinds of drama. One of the most discussed innovations has been the "theatre of fact" or "living theatre" or "documentary." *The Investigation* of Peter Weiss set an example for plays of this kind, which constitute a sort of documentary of the stage, the dramatist endeavouring to present, usually in an objective way, a selection and concentration of the actual events of contemporary history. But however detached he may be, the dramatist must by the very act of selection betray a certain bias, as indeed must the professional historian himself.

It is noteworthy that one of the most sober and objective of such factual plays, Kipphardt's *In the Matter of J. Robert Oppenheimer*, follows Weiss in presenting a judicial enquiry, this kind of trial scene being in itself ripe with possibilities of conflict, suspense, and surprise. Hasting's *Lee Harvey Oswald* follows the same pattern.

Both these plays were shown as part of the "living theatre" series in 1966 at the Hampstead Theatre Club. The Director, Roose-Evans, stressed that each production was pre-occupied with urgent ethical problems and demanded the live concern of the audience.

The R.S.C. has also carried out an experiment in a new genre, that of "Director's Theatre," and the involvement of the audience was certainly the purpose of *US*, directed by Peter Brook as a direct assault on our apathy concerning the war in Vietnam.

Several recent productions have involved biting criticism of the military mentality and recourse to war, notably McGrath's *Bofors Gun*, Vian's *The Generals' Tea Party*, and Charles Wood's *Dingo*.

Meanwhile the pressing international problem of relations between black and white has been illuminated in plays by Fugard, Saunders, and Robert Lowell.

There are indications of a new candour, a more enquiring spirit, about other social problems, including illness, both physical and mental. Peter Nichols has used remarkable skill in revealing the effects on the parents of the incurable illness of a spastic child, and it is now no longer unusual to see a play, often in the mood of ironic comedy, depicting the distressed mind. David Storey's first play had as protagonist a young husband struggling through a nervous breakdown; Mercer is especially concerned with the malaise of the youth educated beyond his parents; and playwrights as dissimilar as Mortimer and Triana have depicted the disturbed personality.

There is now a much more frank and sympathetic attitude towards sexual deviation. In 1965 *A Patriot for Me*, Osborne's uncompromising record of a homosexual, could be performed only privately, while Frank Marcus' *The Killing of Sister George* indicated a lesbian relationship only under cover of some obvious comic satire of B.B.C. serials and their credulous public. But by 1966 a direct and uncluttered picture of a homosexual relationship was staged in Dyer's *The Staircase*.

A related phenomenon is that of transvestism. In a society where wives take on jobs of decorating and young husbands do the washing-up, it is not surprising that the distinctions between the dress of the sexes should have become blurred. Some young men however affect an ultra feminine style and it may be that today's stage "drag" is a reflection of this.

Drag, the impersonation of women by men, is a time-honoured theatrical device in burlesque, pantomime, music-hall, revue, and cabaret, epitomised recently by the expertise of Danny la Rue. But drag has now been used in the straight play, in the astonishing drag ball of Osborne's *A Patriot for Me* and in 1967 in *Wise Child* where Guinness surprised his audience by appearing in woman's dress.

On a very different level was Clifford Williams' production for the National Theatre in 1967 of *As You Like It*, with an all-male cast. The women's parts were taken, not as in Shakespeare's own time, by boys with unbroken voices, but by adult men. In the official booklet of the production seven pages were devoted to quotations and illustrations from the theories of Jan Kott, although Williams disclaimed that his production was "designed to demonstrate specific ideas" put forward by the Polish critic in his recent essay, "The Bitter Arcadia."

Kott's theories are stimulating and unorthodox. Observing the almost identical appearance of youths and girls in a Stockholm coffee-bar he was reminded of such Shakespearean comedies as *Twelfth Night* and *As You Like It*, where the girl appears disguised as a youth. He argues that the theme of these plays is that of the sonnets, "the impossibility of choice between the youth and the woman, the fragile boundary between friendship and love . . . the universality of desire which cannot be contained or limited to one sex." Kott connects his "theme" with Renaissance Neo-Platonism and its concepts of both homosexual and heterosexual love.

Meanwhile dramatists of repute have turned their attention to plays for children. In 1965 Bolt's *Baron Bolligrew* and in 1967 Arden's *The Royal Pardon* and *The Dragon* by the Soviet Yevgeny Schwartz were all warmly received, while Peter Terson scored a success with *Zigger Zagger*, specially written for the National Youth Theatre.

In the realm of pure comedy Alex Ayckbourn in *Relatively Speaking*, 1967, has shown promising wit and craftsmanship.

One of the most stimulating aspects of today's theatre is the welcome given to dramatists from abroad. Since 1965 there have been English premières of works by the Americans Robert Lowell and Feiffer, by the French Duras, Jarry, and Vian; by the Russians Arbuzov, Babel, and Ostrovsky; by Mrozek, a Pole; by Soyinka, a Nigerian; by Fugard, a South African, and by the Cuban Triana—all this in addition to the annual "World Theatre Season," sponsored by the R.S.C.

Candour, anger at injustice and exploitation, sympathy for the unorthodox and eccentric inform our most worthwhile plays which are usually still experimental and questing in method and technique.

There is perhaps some danger that in the rediscovery of the resources of total theatre the literary aspect of drama may be neglected. Excellent revivals of the English and European classics of the stage, especially of Shakespeare, the many-sided genius, help to restore the balance. Here we are especially indebted to the exquisite ensemble playing of the National Theatre and the Royal Shakespeare Companies.

Criteria of Judgment.

How can the value of novel and experimental plays be estimated? The ultimate test of time is obviously impossible and some of the critical principles by which traditional drama has been interpreted are no longer relevant to the revolutionary plays of Brecht and Ionesco.

The first canon of criticism is to remember that every art form determines the criteria by which it is judged, and the good dramatic critic does not approach any play with a pontifical set of rules but endeavours to keep an open mind, and so to discover its unique significance and value.

Since artistic form is an expression of human feeling, the first encounter with a work of art should be in a mood of extreme receptivity, so that by shedding preconceived notions, the recipient may be aware of the feeling implicit in the work, however novel or even bizarre the expression may be.

The initial reaction to drama should be intuitive.

The nature and quality of the implicit feeling can then be considered. Is it an original and genuine response to experience, or perfunctory and stereotyped, is it intense or diffuse, profound or shallow, subtle or commonplace, reasoned or irrational?

Questioning its inherent feeling often reveals that a commercially successful piece, although "well-made," is valueless, while an unconventional work, like Pinter's *Dumb Waiter*, explores and reveals deep-seated anxieties and fears.

Drama is an especially complicated art, in that part of its material being words, it may also involve discussion of ideas. This discussion, however, should not be mistaken for a statement of the author's convictions. In a good play it is an expression of his characters' *feeling* about ideas, a very different thing.

Another enquiry concerns the appropriateness and beauty of the form in which the feeling is conveyed. Many consider that Beckett's *Waiting for Godot* conveys the same mood implicit in *King Lear*, and that each play is an image of man, disillusioned, adrift, assailed by despair in an alien universe. This recognised, the critic's task is to explore the form of the two plays. Apart from the fact that they both use a most improbable fable, they could hardly be more different. *King Lear* is a Renaissance verse tragedy of the fall of princes, with subtle presentation of character development and contrast, and with a coherent plot skilfully developed through arresting action up to the tragic climax. *Waiting for Godot* is a prose play about an abortive encounter, almost devoid of individual characterisation and story, with a static, circular structure and an ending as ambiguous and inconclusive as its beginning. Yet in either case the form of the play has artistic significance and appropriateness and repays analysis, and here again the critic needs to be a flexible interpreter of the artist's purpose.

The most searching question to be asked of a play is whether it is life-enhancing, whether, like the finest art, it gives delight or deepens understanding.

Most difficult to estimate are those plays like *Lear* or *Godot*, which express a mood of despair. But if man's honesty and endurance are ultimately affirmed, the play is not negative in import. Lear begs forgiveness and the tramps still wait.

Similarly a biting satire may be positive if it helps to clear away old wood to make room for new growth. A facile optimism may be a betrayal.

Ideally the best way to know a play is first to see it on the stage, when its theatrical qualities can be enjoyed, and later to read it at leisure, when its literary value can be appreciated.

II. EMINENT THEATRICAL GROUPS

We are greatly indebted to a few enterprising and devoted groups—chiefly repertory companies and theatre clubs—which help to keep drama alive.

Foremost are the Royal Shakespeare Company and the National Theatre, which have earned an international reputation by their superb productions of both classics and new plays. Some groups, such as the English Stage Company, the Traverse Theatre in Edinburgh and in London, and the Hampstead Theatre Club, have been particularly concerned in introducing new dramatists.

Many repertory theatres are doing exciting work including revivals and premières and the Council of Repertory Theatres has a membership of over forty, including theatres at Birmingham, Bristol, Bromley, Cheltenham, Coventry, Dundee, Edinburgh, Glasgow, Guildford, Ipswich, Leatherhead, Leicester, Liverpool, Nottingham, Pitlochry, Salisbury, Sheffield, Watford, Windsor, and York.

Among commercial promoters H. M. Tennent can be relied on for the high quality of their revivals of period plays.

The Royal Shakespeare Company.

When Peter Hall was appointed Managing Director in January 1960 his enterprising work revolutionised the R.S.C. He decided to supplement the annual season of Shakespeare at Stratford-on-Avon by a continuous repertory of classical and contemporary plays at the Aldwych, and in 1962 a special experimental season was also held at the Arts Theatre.

Under the Directors, Peter Hall, Peter Brook, and Paul Scofield a brilliant team of over 100 actors was gathered together and the imaginative direction and artistic perfection of the ensemble playing became world famous.

Each year at the Aldwych original Shakespearean productions from Stratford have alternated with other classics and with unorthodox modern work. Brecht, Pinter, and Livings have been sponsored and 1964 alone saw highly experimental plays by Vitrac, Tardieu, Arrabel, Weiss, Beckett, Whiting, and Saunders.

The years 1966 to 1967 included new plays by Duras, Mrozek, Dürrenmatt, Triana, Feiffer, Mercer, and Dyer, and Peter Brook's much discussed *US*, as well as revivals of Shakespeare, Gogol, and Ibsen.

Inaugurated in 1964, the annual World Theatre Season gives a unique opportunity for seeing ensembles from other countries, special apparatus for simultaneous translation having been installed. In 1967 plays were presented by the National Theatre of Poland, the Comédie Française, the Noh Theatre of Japan, and by eminent companies from Bremen, Milan, Israel, Greece, and Czechoslovakia.

The mobile "Theatregoround" continues to work in collaboration with municipal and educational authorities and recently a thriving R.S. Theatre Club has been founded, very popular with the young. It provides booking facilities and concessions, discussions, and a quarterly magazine, *Flourish*.

In the spring of 1968 there was a re-arrangement among the strong group of artists and excutives at the head of R.S.C. Peter Hall, formerly responsible for both administrative and artistic work, gave up his post as Managing Director, while remaining a Director with special responsibilities for R.S.C. films and for the design and building of the company's new London theatre in the Barbican.

His former functions were divided between Trevor Nunn, Artistic Director, Herek Hornby, Administrative Director. Both posts were newly created. Dame Peggy Ashcroft became the first woman Director and Peter Daubeney and Michel Saint-Denis remained as Consultant Directors. Paul Scofield resigned his position.

The National Theatre.

Sixty years after Granville Barker and William Archer had formulated plans for a National Theatre, the inaugural production of *Hamlet* took place on 22 October 1963 at its temporary home, the Old Vic, pending the building of the permanent theatre on the South Bank, promised by the end of 1971.

Laurence Olivier having already been appointed Director, the nucleus of a distinguished company was formed and soon established its high reputation for exquisite ensemble playing, guest artists also appearing on occasion.

The intention has been to build up a large repertoire of classical and modern plays from all countries. Already a wide range of imaginative productions has been acclaimed by packed houses.

The varied list has included works by Shakespeare, Congreve, Farquhar, Pinero, Brighouse, O'Casey, Shaffer, Arden, Osborne, Chekhov, Ostrovsky, Feydeau, Brecht, and Miller.

Recently there have been added to the repertory a superb interpretation of Strindberg's *The Dance of Death*, produced by Byam Shaw, with Olivier as Edgar, and Tyrone Guthrie's original direction of Molière's *Tartuffe*, in which both he and Gielgud make their welcome début at the National Theatre. Clifford Williams's interesting all-male production of *As You Like It* has appeared and Ben Jonson has been represented by *Volpone*. *Rosencrantz and Guildenstern are Dead* by Tom Stoppard is a contemporary work of great virtuosity.

The scenery has often been breath-taking, especially the designs of the Czech Svoboda for Ostrovsky's *The Storm* and Chekhov's *The Three Sisters*.

A most attractive booklet is issued for each production and is available to the audience at a trifling cost. This supplies authoritative information about the author, the play, its sources and inner references, notable productions and critical estimates, together with photographs, reproductions, and plans.

"Some Facts and Figures," a recent publication, gives a useful survey of the achievement of the National Theatre.

Productions of the National Theatre have appeared at the Chichester Festival Theatre, and have gone on provincial tours. In September 1965 the company made its first tour abroad, visiting the foremost Soviet theatre, the Kremljovesky, and the Frei Volks Buhne in West Berlin. It has played to the Berliner Ensemble, the National Youth Theatre, and the Commonwealth Festival. The film version of the fine *Othello*, with Olivier, had its première in 1966.

The English Stage Company.

Since 1956 the English Stage Company at the Royal Court has been tireless in its discovery and support of new talent. Formed to promote contemporary drama, the company acquired in 1956 a long lease of the Royal Court with George Devine (d. 1965) as Director and Tony Richardson as Assistant. Declaring themselves a Writers' Theatre, they were extraordinarily successful in discovering and sponsoring playwrights hitherto unknown, such as Osborne, N. F. Simpson, Ann Jellicoe, and John Arden, and in persuading the novelist Nigel Dennis to write for the stage.

An offshoot of the Company, the English Stage Society, initiated in May 1957 the inexpensive Sunday night "Productions without Decor", which brought to light such successes as Wesker's *The Kitchen* and Owen's *Progress to the Park*.

Writers beginning to make their reputation elsewhere were welcomed at the Court. Beckett's *Endgame* and *Krapp's Last Tape* had their première here. Many distinguished foreign plays were seen in Britain for the first time at the Court, including Arthur Miller's *The Crucible*, Tennessee Williams' *Orpheus Descending*, Ionesco's *The Chairs* and *Rhinoceros*, Sartre's *Nebrassov* and *Altona*, Genet's *The Blacks*, and Brecht's *The Good Person of Szechwan*, the first Brecht ever staged in London.

In October 1965 William Gaskill succeeded Devine and the autumn season 1965 saw new plays, by Jellicoe and Simpson, and *Saved* by Bond, a new writer. There have since been revivals of both classic and modern works and several British premières of unusual plays, including Wesker's *Golden City*, Orton's *Crimes of Passion*, Charles Wood's *Dingo*, and the Nigerian Wole Soyinka's *The Lion and the Jewel*. A most interesting departure has been to stage here for the first time plays from the past hitherto ignored, such as Jarry's seminal French play of 1896, *Ubu Roi*, and the Russian Babel's *Marya* of 1933. The establishment of D. H. Lawrence as a dramatist, culminating in the special Lawrence season of 1968, has been an event in theatrical history.

The E.S.C. is now doing valuable educational work by including a series of productions of both modern and classical plays specially chosen to meet the needs of schools. Facilities for cheap seats for holders of Student Cards have also been generously extended.

The Mermaid Theatre.

It was largely due to the efforts of Bernard Miles "and other poor players of London" that in 1959 the City of London's first new theatre since Shakespeare's time was opened at Puddle Dock, down at Thames-side at Blackfriars. Commerce, industry, and the general public had generously weighed in with money, the City Corporation had granted the site at a peppercorn rent and the four-foot-thick surviving walls of a great warehouse, blitzed in 1941, had been used as the shell for a delightful little theatre of 499 seats.

It was designed with an open stage, based on that of Shakespeare's day, while an excellently raked auditorium, all on one tier like a segment of a Greek amphitheatre, ensured a perfect sight line from every seat. The most modern lighting, revolving stage, and sound and film equipment were installed, an attractive restaurant overlooks the Thames, and there is an exceptionally spacious foyer, with bars and snack bar open to the public.

The Mermaid Theatre is now a valuable part of the artistic life of the City, with foyer exhibitions, films, concerts, and lectures. An enterprising "Molecule Club" for children aims at bridging the gap between science and art by using theatrical means to demonstrate the basic scientific principles.

The Mermaid Theatre has now a fine and varied record of productions, including British premières of works by Brecht, Camus, O'Casey, and Bill Naughton. There have been revivals of such major British dramatists as Shakespeare, Ford, Dekker, Beaumont and Fletcher, and Shaw, and of foreign plays by the Greek tragedians, Ibsen, Pirandello, and Henry James.

In the year 1967 alone there were productions of plays by Shaw, O'Casey, and D. H. Lawrence; Henry James's *The High Bid*, Lessing's *Nathan the Wise*, and an imaginatively planned cycle of four dramas by Euripides concerning the Trojan Wars. The Mermaid also had the honour of presenting the English première of the fine verse play, *Benito Cereno*, by the leading American poet, Robert Lowell.

Theatre Workshop.

During the years 1953–61 Joan Littlewood as Director of Theatre Workshop, at Stratford East, introduced several new playwrights, including Behan and Delaney. Spontaneity and pseudo-Brechtian techniques and not careful construction were the hallmark of her work which culminated in *Oh What a Lovely War* (M). This paradoxically used a period pierrot show brilliantly to satirise the tragic futility of the First World War.

In 1967 Joan Littlewood returned to Theatre Workshop and there directed *MacBird* and *Mrs. Wilson's Diary*.

MacBird (P), by Barbara Garson, is an American parody on *Macbeth*, written in doggerel blank verse. Described by Brustein as "brutally provocative" and "grimly amusing," it is a violent political satire, savagely attacking the American political "establishment." Lyndon Johnson is represented by Macbeth, President Kennedy by Duncan, and Robert Kennedy by Malcolm.

Unfortunately Joan Littlewood made such alterations to the text—transposing much of the verse to prose and adding or omitting characters—that the significant parallel to Shakespeare has been blurred and the satirical impact blunted.

Mrs. Wilson's Diary, which takes the form of a jolly pre-war musical comedy, is described by its authors, Richard Ingrams and John Wells, as "an affectionate lampoon" on Wilson's administration.

The Hampstead Theatre.

The Hampstead Theatre Club, now London's first Civic theatre, under the energetic direction of Roose-Evans, has sponsored many aspiring playwrights. It has to its credit the world premières of plays by dramatists such as Giles Cooper, Pinter, Milner, Howarth, Bowen, McGrath, and recently even Tennessee Williams, a rare distinction.

III. GLOSSARY OF DRAMATIC TERMS

Absurd Drama.

The Theatre of the Absurd, originating in Paris, was introduced here through the plays of Beckett and translations of Ionesco, Vian, and Vitrac. It has had considerable impact on Pinter, N. F. Simpson, Saunders, Stoppard, and Campton, while American absurdist plays by Albee, Gelber, and Kopit and by the Swiss, Frisch, have also been produced here.

The concept of the Absurd was first formulated by Camus to indicate the discrepancy between human reason and aspiration and an indifferent and hostile universe. But like Sartre he expressed his convictions through the traditional dramatic form.

Not every playwright of the Absurd is an existentialist and many are more concerned with an irrational human society than with the universe. What they have in common is a technique. All have discarded traditional realism and express absurdity through images that are themselves absurd, including bizarre situations and objects, both sad and comic, such as aged parents consigned to dustbins.

There is in the Absurd an element of Surrealism and Miss Bradbrook has suggested that a better term might be Theatre of Dream, for it is the unconscious dream mind that juxtaposes objects and incidents that in the waking state have no connection, such as a rhinoceros in a provincial street. Pinter seems to have an intuitive awareness of the hinterland of dream, while Simpson makes a conscious manipulation of Surrealism.

Frisch has ably demonstrated that the Absurd can be an effective vehicle for satire and many absurdist writers, such as Ionesco and Simpson, have satirised the modern prostitution of language corrupted by salesmen and politicians, and have used conversation of vapid emptiness to reveal its breakdown as a means of communication.

It is partly because of their distrust of language that they have had recourse to ludicrous objects and images, thus extending the range of total theatre.

The Aristotelian Play.

Brecht and Ionesco have disparagingly referred, somewhat inaccurately, to "Aristotelianism." Strictly speaking, this means the concept of tragedy which Aristotle first analysed in his *Poetics*, basing it primarily on the poetic tragedies of Sophocles, especially the *Oedipus Rex* (P), *c.* 425 B.C. The Aristotelian concept, revived since the Renaissance, has obviously been much modified, but certain basic principles can still be discerned.

Aristotle claims that poetry in general aims at that rational pleasure which is part of the good life. He defines tragedy as the imitation of an action complete in itself and stresses its inner coherence. Tragedy must have an intelligible beginning, a middle necessitated by the beginning and which itself necessitates the end. "The story . . . must represent one action, a complete whole, with its several incidents so closely connected that the transposal or withdrawal of any one will disjoint and dislocate the whole."

The action should be of some magnitude, with "incidents arousing pity and fear wherewith to accomplish the purgation of such emotions." Here is Aristotle's celebrated doctrine of purgation or "catharsis" which has been variously interpreted, some considering that something like a ceremonial purification is intended, with an ethical end in view, others that bodily or psychological relief from tension is meant.

Aristotle emphasised the paramount importance of action or plot, the characters being revealed in and through the action. The kind of plot recommended is one where the hero is an eminent man, neither inordinately good nor bad, whose misfortune is brought upon him by some error of judgment.

Here is the germ of the splendid Renaissance tragedy concerned with the fall of princes and also of the modern finely constructed play, such as Ibsen's *Ghosts*. Such a play has classical symmetry, the beginning, middle, and end, becoming in modern parlance the exposition, development, and climax or denouement. It has its own organic unity and inevitability. But although many writers, such as Sartre, still work within the classical disciplines many have discarded the traditional form.

Brecht and his followers have repudiated the whole pattern in favour of a sequence of self-contained episodes strung along a narrative thread, where ironic detachment supersedes the emotional involvement and catharsis of Greek tragedy.

In this day of the common man few are concerned with the fall of princes, and it is interesting to examine some of the more striking modern plays and to ask how far they stand up to the Aristotelian canon. Should a new concept of tragedy be evolved, that of potentiality unrealised, not a fall from greatness but a failure to rise?

The Brechtian or Epic Play.

Many British dramatists have felt the pervasive influence of the Bavarian Brecht (*q.v.*), who developed a new kind of Epic or narrative play of debate, with a loose sequence of episodic scenes linked by commentary or songs. Discarding realism, Brecht attempted not to arouse the onlooker's emotions but to stimulate him to think about social issues and to take left-wing action. In the event his ambiguous central situation appealed to deeper levels of experience.

There have been several instances of the ambiguous protagonist, but English playwrights have tended to adopt not the political intentions but the style of the Epic genre. Esslin has said that Shaffer in *The Royal Hunt of the Sun* has joined "Bolt, Arden and John Whiting of *The Devils* in the select group of British dramatists who have genuinely benefited from the conception of epic . . . techniques in drama."

Theatre of Cruelty.

In 1938 Antonin Artaud published *The Theatre and its Double*, a collection of essays and letters, which forms the theoretic basis of the Theatre of Cruelty, his central purpose being a ritual of cruelty to exorcise fantasies.

Professor Brustein has described how Artaud hated industrial civilisation, believing, like Freud and D. H. Lawrence, that it stifled instinctual life. He claimed that the theatre, as the heart of a common culture, should enact a primitive ritual of cruelty, a sacrificial frenzy and exaltation. In this way it would bring to the surface and exorcise the spectator's latent anarchy, violence, and eroticism, serving as an "outlet for repressions."

Artaud envisaged a total theatre, appealing to total man, primarily visual, where the all important Director would deploy "music, dance, plastic art, pantomime, mimicry, gesticulation, intonation, architecture, scenery and lighting" to induce a state of trance. Attacking the inadequacy of a pallid conceptual language, Artaud demanded that dramatic language should have an emotional and incantatory effect.

It is Genet who most closely fulfils Artaud's demands and in England the specific Theatre of Cruelty has been best represented by his plays, the *Marat-Sade* of Weiss, and Triana's *The Criminals*. But the methods of production advocated by Artaud have had a wide and pervasive influence on the movement towards total theatre.

Expressionism.

One of the most notable contemporary revivals of Expressionism is Wesker's *Chips with Everything*. The genre flourished in Germany after the First World War, where its chief exponents were Kaiser and Toller, and in Czechoslovakia in the plays of Capek. O'Neill and O'Casey have also occasionally experimented with Expressionism.

Reacting from Realism with its insistence on individual psychology and the detailed representation of actual life, Kaiser, Toller, and Capek sought to express rather the general aspirations and fears of humanity, especially man grappling with the advent of machinery. Their characters are symbolic types, as the Nameless One, representing the mob in Toller's *Man and the Masses*. Their decor is stylised, the dialogue staccato, and the brief scenes are characterised by mass movement and swift action.

Naturalism.

Naturalism in drama may be regarded as a special case of Realism, and it is not easy, nor perhaps always desirable, to make a sharp distinction between the two.

Naturalistic drama attempts to record as faithfully as possible the actual experiences of life, however banal, and to present life, undistorted by the playwright's theories or too much concern for artistic form. The virtues of Naturalism are fidelity and spontaneity. Its danger is that it may keep so close to life as to lose artistic form and tension, becoming the stage version of the tape recorder. *See* Slice-of-Life Play.

It was Zola in the 1870s who propounded the principles of Naturalism. Distrusting both the play of ideas and the well-constructed play as tending to impose on life a falsifying and artificial pattern, he urged that drama should record as objectively as possible the actual course of man's life, especially the way it is conditioned by environment.

Strindberg's *Miss Julie*, 1888, is an essay in Naturalism but the genre is found in its most accomplished form in the Russian theatre, especially in Stanislavsky's production at the Moscow Art Theatre of the plays of Chekhov and in 1902 of Gorky's *The Lower Depths*.

Neo-Realism.

There is nothing new in dramatic Realism (*q.v.*) as such. What is novel is the realistic presentation of the shabby lodgings and streets of the underprivileged. Gorky in *The Lower Depths* was perhaps the first dramatist to reveal the wretched condition of the destitute and this play influenced O'Neill's *The Iceman Cometh*. Their recent production in London, with a starkly realistic background, had some effect on those contemporary plays where the kitchen-sink and dustbin are as much in vogue as was formerly the fashionable drawing-room.

Any worth-while play has significance far beyond its milieu and modern neo-realistic plays vary greatly in theme and purpose. Wesker, Delaney, Livings, Owen, Osborne, Orton, Bond, Lawler, and Seymour have all used the style in differing ways.

Several of these playwrights have themselves been workers and their plays are an authentic interpretation of their own culture, once inaccessible to the middle-class audience. The fact that their work is occasionally loose in structure may be attributable to the influence of Naturalism (*q.v.*) or to the author's unacademic background. The advent of this fresh and vigorous drama from a group that has seldom been articulate is one of the most encouraging aspects of modern theatre.

Realism.

Writers of realistic drama, such as Galsworthy, attempt to create a stage illusion of actual life, usually through the medium of the well-constructed play. It is not always easy to distinguish between Realism and Naturalism—its extreme form—but one salient difference is that the latter tends to discard organised plot as imposing a false pattern on the flux of life.

Bolt, Cooper, Mortimer, Shaffer, and Porter have all written realistic plays, and since the 'fifties there has been a succession of competently constructed realistic plays associated with the novelists, Graham Greene, C. P. Snow, and Muriel Spark.

The Satirical Play.

Recent years have seen heartening revivals of plays by Shaw, triggered off by Stage Sixty's production of *Widowers' Houses*, with its topical relevance to Rachmanism. There followed a long succession of Shaw revivals, including *Too True to be Good*, from the Edinburgh Festival, *You Never Can Tell*, with Ralph Richardson, and *Heartbreak House* from Chichester.

Shaw has found few successors, for genuine satire is a most demanding art. Subjective hostility and negative criticism are not enough. The motive power in Ibsen and Shaw was rational indignation, a most difficult fusion of strong emotion and objective reasoning, and their satire was constructive in that it implied and indicated positive values. It was also characterised by a precise aim at a specific target. Vague and wholesale denunciation diffuse a disagreeable tone which has a boomerang effect for it becomes associated not with the targets but with the playwright himself.

The graces of satire are detachment, irony, and wit and it flourishes apparently in a stable society such as that of the 18th century, which produced Swift and Voltaire. The European upheavals of the last half century have been unpropitious for satire and it is significant that the best plays in this genre, those of Frisch and Dürrenmatt, have come from neutral Switzerland.

The English playwright nearest to Shaw is Nigel Dennis, and Giles Cooper shared his ironic detachment.

The "Slice of Life" Play.

Here is an extreme kind of Naturalism, where the author has been so anxious to preserve fidelity to the natural spontaneity of living, that he has all but discarded form, as having a cramping and distorting effect.

One of the most typical examples is Henry Chapman's *You Won't Always Be On Top*, showing the disconnected minor incident and talk of men ostensibly "at work" on a building site. Shelagh Delaney's *The Lion in Love* is also in this vein.

Verse Drama.

During the 20th century several attempts have been made to revive drama in verse—the normal vehicle for the Renaissance playwright. Although the verse plays of Shakespeare and his contemporaries, kept alive in excellent revivals, still rise like the Himalayas above the contemporary scene, the dramatist today who tries to use verse has not the benefit of an unbroken tradition. Yeats, T. S. Eliot, and Christopher Fry all succeeded for a time in getting their verse plays on to the stage but at the moment the most successful poetic drama achieves its effect through poetic prose and the theatrical poetry of its situation and stage imagery. Dylan Thomas' *Under Milk Wood* successfully used these media. For many contemporary audiences it is Beckett, Arden, and Pinter who have captured the poetry inherent in drama.

The finest verse play seen on the English stage for many years is Robert Lowell's *Benito Cereno*.

The Well-made Play.

The term "well-made play" is most frequently used in a derogatory sense. Eric Bentley has pointed out that the "well-made play" is a form of classical tragedy, degenerate in that although the plot is ingeniously contrived, with arresting situation, intrigue, and suspense, the play is

mechanical and devoid of feeling. The television series, *The World of Wooster*, is an example.
The expression was frequently used disparagingly of the French plays of Scribe and of Sardou, ridiculed by Shaw for his "Sardoodledum."

IV. DIRECTORY OF DRAMATISTS

This part, alphabetical in arrangement, includes dramatists whose work, whether English or in translation, has had its British première since 1950. Unless otherwise stated the quotation of date and actor refers to the British première.

Inexpensive paperback editions are referred to thus: F: Faber and Faber. M: Methuen. P: Penguin.

Arthur Adamov (b. 1908).

Adamov first wrote plays such as *Professor Taranne* (P), which translate his own personal neuroses into images of the absurd, until with the propagandist *Paolo Paoli* he adopted a Brechtian technique. His *Spring 1871*, an epic panorama of the Paris Commune, had its world première in London in 1962.

Edward Albee (b. 1928).

The American Albee, an adopted son, is a brilliant satirist of his society.

The Zoo Story. P.

An absurdist one-act dialogue reveals a schizophrenic's failure to communicate—even with a dog—and ends with his self-immolation.

The Death of Bessie Smith.

The neurotic refusal of white hospitals in Memphis, in 1937, to admit the injured Negro singer is realistically presented.

The American Dream. P.

In an absurdist satire the newly adopted son proves to be a facile devitalised youth and an unscrupulous materialist.

Who's Afraid of Virginia Woolf? 1964. P.

A brilliant and scarifying satire on sterility in an American campus uses a ritual movement. George and Martha, named after the Washingtons, are an unsuccessful and childless middle-aged couple. They cherish a fantasy "son," whom George, to spite Martha, symbolically "murders" during a liquor-ridden night party, when they attack each other and their guests (a young couple also childless) with ferocious mental cruelty.

Jean Anouilh (b. 1910).

Anouilh is a playwright of remarkable theatrical versatility and skill. Following Giraudoux, he has frequently employed classical themes, as in *Eurydice* (M), and *Antigone*, 1949 (M), with Olivier and Vivien Leigh. More recently he has treated historical figures, Saint Joan in *The Lark* (M), and Becket in the play of that name (M). The play within a play is a favourite expedient of his and he used it again in *The Fighting Cock* (M), produced at Chichester, 1966.

Anouilh's outlook is deeply pessimistic. A recurring theme is that purity is incompatible with experience of life and many of his protagonists say, "No." His plays fall into two categories—the fatalistic *pièces noires* and the romantic fantasies, *pièces roses*.

They have been extraordinarily popular on the London stage of the 'fifties and Anouilh's amoral attitude has been reflected in many West End

Aleksei Arbuzov (b. 1908).

The Russian producer and playwright Arbuzov has been writing since 1930.

The Promise. 1966.

In the best tradition of naturalism *The Promise* is a moving and positive work free from both illusion and despair.

During the siege of Leningrad three adolescents, two boys and a girl, contrive to survive in a bombed house, and here in brief episodic scenes their hardship, gaiety, and the slow awakening of love are shown with a delicate and touching naturalism.

Four years later Lika must choose between the two men and although she loves the engineer Marat she chooses the dependent, poetic Leonidik. The decision brings fulfilment to no one and finally Leonidik courageously summons back Marat and leaves him and Lika together, a conclusion analogous to that of *The Caucasian Chalk Circle*.

John Arden (b. 1930).

Arden is a vigorous and gifted playwright, who has experimented with a variety of subjects and methods, sometimes too original and complex to find quick acceptance.

His characters are full-blooded and rich in human contradictions, and he has sympathetically brought to life even such bogeys as Herod and King John. He loves to dwell on some ambiguous personality, where generosity conflicts with violence, and to consider the problems of directing man's unruly vitality.

His favourite theme is the dispute between instinctual energy and good government and he pleads the case cogently for both sides, giving no facile judgment or direct "message," unless it be "the recognition of the fallibility of man." Thus although, like Brecht, he is deeply concerned with social and political dilemmas, he remains politically "uncommitted." He is above all the dramatist of the dilemma.

There has been a fruitful cross-fertilisation of Arden's interest in current events and his literary studies; and his historical plays, like Brecht's *Mother Courage*, combine a fine sense of period and a sharp relevance to some current issue.

Arden's plays are poetic in structure, depending in part on the recurrent image and metaphor and, like Arthur Miller in *The Crucible*, he has skilfully devised for each an appropriate dialect of time and place. At the same time he has a keen sense of theatre, and has successfully adapted techniques from Miracle plays, Elizabethan drama, music-hall, puppet stage, and Brechtian epic play.

Live Like Pigs. 1958. P.

Seventeen realistic scenes, full of comic and frightening incident, reveal how tensions develop between households at different social levels in a council housing estate. The authorities—a well-meaning local official (Alfred Lynch) and a police sergeant (Stratford Johns)—fail to forestall a violent and fatal conflict.

Most of the scenes are prefaced, in Brechtian style, by verses of the old street-ballad type, sung with monotonous melancholy. This device gives a sense of the universal nature of human discord in an otherwise firmly particularised time and place.

The Happy Haven. 1960. P.

Here, in a good-tempered satirical fable, enlivened by a dash of magic, Arden touches on problems of longevity.

Doctor Copperthwaite, the superintendent of the Happy Haven, an old people's home, is, like a mediaeval alchemist, bent on producing an Elixir of Life and Youth, intending to use his five unsuspecting patients as guinea-pigs. But outwitted by them he is himself transformed into a small boy.

The theme is childishness. The egocentric demands of the very old are seen as amusing childish foibles, while Doctor Copperthwaite, so absorbed in his research as to forget ends for means, brings childishness on himself.

In form the play is an extended puppet show. The characters wear masks, the set is formalised, and there is even a dog, Hector, but unlike Dog Toby he is visible only to the dramatis personae.

Serjeant Musgrave's Dance. 1959. M.

For a fine play, which explores the ethical dilemma of war, Arden drew on two sources—contemporary events in Cyprus and a journal written by a deeply devout N.C.O. during the Crimean War. He has fused his material into vivid incidents, which he projects against the background of a fictitious colonial war of the 1880s.

In a frost-bound colliery town there arrive three private soldiers, led by the dominating Serjeant Musgrave. They claim to have come recruiting but are in fact deserters from a colonial war.

In spite of his rigid sense of military duty, Musgrave had been horrified by the terrible five-fold reprisals taken by the British for the assassination of a comrade, Billy Hicks. Believing himself to be God's agent, he has now come to Billy's town, obsessed by one purpose, to expose war's horrors.

Exhibiting Billy's skeleton in the market-place, he at first wins sympathy in his denunciation of atrocities. Then bewildered by his own confused "logic," he demands twenty-five deaths in return for the five taken by the British and turns the gatling on the astonished crowd.

Suddenly, with the thaw, the Dragoons arrive and Musgrave finds himself awaiting execution, stunned that no one has learned the lesson he yearned to teach.

Fierce incident and macabre surprise are used for a play of ideas which enunciates no facile answer. It is typical of Arden's fair and non-doctrinaire approach that the dilemma of the religious man in face of war should be embodied in the fanatical and confused Musgrave. This has sometimes misled the audience, but the spirit of compassion implicit throughout the play is clearly revealed in the gentle, pacific Private Attercliffe, who is also to be executed with Musgrave. The women's parts are also significant, especially that of Mrs. Hitchcock, the owner of the inn, who visits Musgrave in prison and shows him how he had erred in trying to use war itself to end war. In his darkest despair she gives him hope, and it is symbolic that he accepts drink from her hand.

The complex play weaves together many tensions: harsh discord between colliery owner and strikers; contention between the three privates, each of whom is strongly individualised; the discrepancy between a woman's love and the careless soldier's life; Musgrave's own bitter inner struggle.

The dialogue has a wonderful period character and the soldiers' ballads and lyrical songs occur with complete naturalness.

The Workhouse Donkey. 1963. M.

Styled by Arden as a "vulgar melodrama", this ample Brechtian play shows jockeying for power in a northern town between the Tory Alderman Sweetman, a wealthy brewer, and Alderman Butterthwaite (Frank Finlay), the Labour ex-mayor. Both attempt to manipulate the police and to enlist the support of the electorate, represented by the shifty turncoat Doctor Blomax, until all these four elements of the community are deeply corrupted.

Butterthwaite, called "the workhouse donkey" because born in the workhouse, is the dominating Rabelaisian character. A Dionysiac figure, he is drunken, lecherous, and amoral, yet devotedly loyal and generous. Finally in an attempt to help the treacherous Blomax he robs the Borough safe and brings disaster on himself and the town.

Arden says, "The personality of the late Mr. Joseph D'Arcy of Dublin inspired much of the play."

Armstrong's Last Goodnight. 1964. M.

The old "Ballad of Johnie Armstrang," .. 1603, forms the framework of a play concerning the dilemmas of government. Armstrong of Gilnockie, the Scots Border laird, freebooter and rebel, is invited to a meeting by the young Scottish King James V and then treacherously hanged. Arden has introduced into this stark story the historical character of the king's herald, Sir David Lindsay, poet and politician, and shows him at first striving by devious diplomatic expedients to persuade Armstrong (Albert Finney) to loyalty, before he finally advises force. The play is diversified by minor characters and incidents which sometimes, however, overcomplicate and obscure the impressive ballad line.

The introduction of Lindsay was suggested to Arden by his reading of Conor Cruise O'Brien's book *To Katanga and Back*, for he was struck by "a basic similarity of moral" between 20th-century Africa and 16th-century Scotland, the rôle of O'Brien being similar to that which he invents for Lindsay.

Arden makes free use of Elizabethan pageantry and of Brechtian ballad-singing and the setting is the mediaeval convention of "simultaneous mansions," Gilnockie, the Border, and the Court all being formally represented on the stage at one and the same time.

Arden "constructed" a dialect to suggest the place and period, but for the English audience it is not easy to follow, especially as Armstrong himself has a marked impediment in his speech.

Left-handed Liberty. 1965. M.

When commissioned by the Corporation of the City of London to write a play to commemorate the 750th anniversary of the sealing of Magna Carta, Arden made a careful study of the historical facts, which he presents with very little transposition and addition.

He approaches his theme of liberty from an unusual angle, showing the aftermath of Runnymede in the apparent failure of the Charter, and demonstrating that the agreement had to take place in people's minds before it could become effective.

It is typical of Arden that he does not present a clash of black and white. John is a rounded character, a slippery villain, but shrewd and energetic and gifted with the Plantagenet charm, while some of the barons are coarse and unscrupulous fighters.

The use of stylised scene emblems, such as charts, maps, and views of Runnymede, give mediaeval colour to the simple stageing and Arden has again invented a suitable dialect.

The Royal Pardon. 1967. M.

A play for young teenagers, that developed out of bedtime stories for the Arden children, was written in collaboration with Margaretta D'Arcy.

Isaac Babel (1894–1941).

Between 1937 and 1957 the work of Babel, the Russian Jewish short-story writer, was banned in Russia. He died in Siberia. *Sunset*, the first of his two extant plays, produced in Russia under Stanislavsky in 1928, appeared on B.B.C. television in 1964.

Marya. 1967. P.

Written in 1933 but not yet professionally produced in Russia, *Marya* is set in Petrograd in February 1920. It evokes a precise period in history—the flux and confusion just before the Bolsheviks consolidated their power in March 1920.

The organisation of the play is poetic, the balance and interplay between two social milieus. One is the decayed elegance of the liberal intelligentsia focused in the home of Mukovnin, a former General, where the men are well-disposed but impotent, the women unchaste. The other is the squalid house where Dymschitz, the Jewish merchant turned black-marketeer, lives with his hangers-on and crooks.

As in Chekhov, the characters are studied in psychological depth and the quiet naturalism of the style is sometimes startled by sudden violence as in the shootings after the rape of Ludmilla, Mukovnin's younger daughter, and the link between the two households.

The play is also shot through with symbolism. It is significant that Marya, the General's energetic elder daughter, never appears in the play. She has left the scene of confusion to serve at the Front and in the final scene a peasant couple, the wife pregnant, are brought up from the basement to occupy the once fashionable Mukovnin apartment.

James Baldwin (b. 1924).

Baldwin is an American Negro novelist and essayist, and a champion of Civil Rights.

The Amen Corner. 1965.

Acted by a Negro cast including singers of Spirituals, the successful play gently probes the genuine and the self-deluded elements in religious experience.

Samuel Beckett (b. 1906).

Beckett, an Anglo-Irishman, who has made his home in France, is both novelist and the most distinguished of the English dramatists of the Absurd. His world is drastically limited, peopled chiefly by old men awaiting their death, but it is the profoundly tragic world of Lear in the storm and it is conceived with the intensity and haunting power and suggestiveness of the true poet.

His work is poetic in its verbal imagery, sometimes as searching and macabre as that of Webster, and his dramatic prose has an underlying poetic rhythm often more flexible and effective than that of Eliot's verse. In structure his plays have a poetic symbolism, a latent significance, like that of the novels of James Joyce, Beckett's close friend, and their striking visual imagery has a kind of theatrical poetry, as for instance the two tramps at the foot of a bare tree in *Waiting for Godot*. It is remarkable that so literary a playwright should also have succeeded with the wordless mime play.

Beckett's chief weakness as a dramatist is that the action and visual imagery are frequently too static, as in the motionless dustbins in *End Game*, much less effective theatrically than Ionesco's movable chairs.

Waiting for Godot. 1955. F.

This tantalising and compelling tragi-comedy, Beckett's masterpiece, originally written in French and produced in Paris in 1953, was later translated and performed in more than twenty countries.

Character and incident are pared to the bone and only a skeleton situation remains. At evening, on a desolate road, bare but for a single tree, two wretched tramps, Vladimir and Estragon, wait for a mysterious Mr. Godot. As they while away the time with desultory talk and clowning, a tragi-farcical diversion is provided by the entry of Pozzo and Lucky, bullying master and wretched slave, and a boy later brings a message that Mr. Godot cannot come but will arrive the next evening. After discussing whether or not they shall hang themselves from the tree, the tramps decide to go away for the night, but remain on the spot.

Act II presents "Next day, same place," the only difference being that the tree has sprouted a few leaves, and the basic pattern of Act I is repeated.

Although by the skilful use of music-hall techniques Beckett presents his tramps in the guise of amusing clowns, they are at the same time pathetically human as they waver between suicide and irrational hope. A fretful affection has kept them together over fifty years, and their dispositions are complementary, possibly even representing different aspects of the one personality. The practical and extrovert Vladimir, nicknamed Gogo, may depict man's intellect, his executive powers, the ego, while the more poetical and introvert Estragon, nicknamed Didi, may represent the body, instinct, the id.

Pozzo and Lucky, another pair of contrasting characters, are portrayed more farcically. The loud, confident Pozzo drives Lucky in as if he were a beast of burden. Lucky carries in his mouth the whip with which he is beaten and humbly obeys every insolent command. He dances for Pozzo and even thinks for him. In their second appearance Pozzo is blind and Lucky deaf.

They may be considered personifications respectively of master and slave, worldly materialism and higher values, the physical and the intellectual, body and soul, or the two aspects of a sado-masochistic relationship.

The play as a whole is a most complex dramatic symbol expressing man's anxiety and suffering as to his origin and destination.

The uncertainty is symbolised by the characters' confusion as to even the physical actualities of time and place, but the dominating symbol is the tramps' doubt as to Godot's identity and purpose.

Such an oversimplified interpretation as to equate Godot with God is inadequate, yet the play has undoubted Christian references. A tree is frequently used as an emblem of the Cross. Beckett, questioned about its theme, quoted a wonderful sentence in Saint Augustine, . . . "Do not despair; one of the thieves was saved. Do not presume; one of the thieves was damned."

Beckett neither affirms nor denies Saint Augustine's statement but inverts it into a question, more distressing than direct denial. Can we any longer accept the existence of divine grace and judgment? It is a question such as this that gives to the play its symbolic shape of doubt, and which is cogently expressed in the theatrical image of two outcasts at the foot of a tree, a tree of life which puts forth leaves, a tree of death which they contemplate using as a gallows.

Yet the significance of the play is even deeper than an exploration of religious doubt, its appeal wider and more contemporary. The anguished uncertainty of the 20th century is whether life has any meaning whatsoever and the play shows the suffering of man, lost and anxious in an apparently meaningless universe.

Some have considered it to be written from the point of view of existentialism: continuing vainly to hope for a supernatural revelation, the tramps lack the courage to come to terms with the nothingness of our existence and the need to choose and create our own destiny.

A Jungian psychologist, Eva Metman, has made similar interpretation, remarking, "Godot's function seems to be to keep his dependents unconscious."

"Habit is a great deadener," says Vladimir. If Beckett's play enables the audience to escape the drug of habit and to face this image of anguish and so find some relief, then it may have the therapeutic value of that inner knowledge advocated by Freud and Jung.

It is not a play for those who cannot bear to suffer. When performed in San Francisco Gaol, the first play there for forty-four years, it held its audience of fourteen hundred convicts spellbound. They realised that each must find his own personal message. All knew that it spoke to those who must suffer and wait.

Endgame. 1958. F.

Also re-created from the French, this play again depicts a static situation. In a single, claustrophobic room, the selfish, materialistic Hamm, who keeps his senile and legless parents in dustbins, is now paralysed and blind and dependent on his servant Clov, who longs to leave him. But if Clov should leave, both would die, for Hamm owns the only store of food in a devastated and dead world. Finally Clov sees outside what may be a small boy, "a potential procreator," and he prepares for departure but remains immobile.

The play like poetry can be interpreted in several ways. Since Hamm and Clov are mutually dependent, it probably represents tension between complementary aspects of personality, Hamm sensation and emotion, and Clov intellect. As Clov has vision and sees the boy, the situation suggests the struggle of the mystic endeavouring to escape from a deadening materialism to a vital awakening of the spirit. It may also depict a period of traumatic depression when the whole external world seems dead and unreal. The play's overall impression is that of the dissolution of the personality in death, both personal and global.

Endgame lacks the wry humour of *Waiting for Godot*, and is less compelling than Ionesco's *Exit the King*, but is more potent in its latent imagery than is Ionesco's play.

Krapp's Last Tape. 1958. F.

In the briefest sketch, Krapp, a solitary, decrepit, unsuccessful old man listens to his own autobiographical tape-recording of thirty years ago, but the moment of miraculous insight it commemorates is now so meaningless to him that he switches off that section of the recording and broods on a description of his love-making.

Beckett employs a most effective stage device to pose contemporary queries as to the limitations of verbal communication and the continuity of personal identity.

Happy Days. 1962. F.

Here again the paralysis of later life is indicated. A woman talks ceaselessly, although progressively buried in a mound of earth until it reaches her neck.

Beckett's two "Mimeplays without Words" are in striking contrast to the plays in that all is conveyed in symbolic wordless action.

Brendan Behan (1923–64).

Behan, a Dubliner, and author of the autobiography, *The Borstal Boy*, used his own experiences in the I.R.A. and as political prisoner to give substance to his two unusual plays.

The scripts of both were sent to Joan Littlewood and considerably altered, especially in the deletion of "chunks of terrible sentimentality," while the length of *The Hostage* had to be trebled. Lacking in structure and depth of characterisation, they are vividly impressionistic, lively, and voluble. As Tynan says, "Language is out on a spree, ribald, dauntless and spoiling for a fight."

Because they are presented in comic terms, Behan's strong social convictions are fully integrated in his plays. *The Quare Fellow* is an effective plea for the abolition of capital punishment and *The Hostage* makes the business of war seem extremely childish.

The Quare Fellow. 1956. M.

The scene is an Irish gaol during the twenty-four hours immediately preceding the execution at 8 a.m. of "the quare fellow," who has brutally killed his own brother. Farcical and macabre happenings succeed one another, as the unnerving effect of impending death is shown on both prisoners and warders, while a recurring song from the punishment cell sounds a melancholy refrain. The sombre theme is presented obliquely, masked by the harsh irony of prison jests, and although the play has little plot it is remarkably tense, partly because we never see the condemned man. Much is also due to Joan Littlewood's skill in redistributing dialogue and tightening the structure.

The film version completely distorted the disciplined and claustrophobic atmosphere of the play.

The Hostage. 1958. M.

Again the basic situation is the waiting for an execution. The scene is an old Dublin house, once the refuge of the I.R.A., now a brothel. Irish patriots bring here a captured Cockney private soldier, Leslie Williams, as hostage for an Irish boy, now a political prisoner in Belfast, who is to be executed next morning.

Teresa, the gentle little Irish maid, reared in a convent, tries to save Leslie. There is touching pathos as these two orphans, neither of them understanding what the strife is about, recall their childhood, and when in a raid on the house Leslie is shot, Teresa utters her lyric lament. But the mood is only held for a moment. Leslie leaps up and sings "The bells of hell go ting-a-ling-a-ling," and the play ends.

The mood is much less consistent than that of *The Quare Fellow*. Here the comedy is chiefly a diversion supplied by a host of minor characters. The action is constantly held up for songs more or less satirical and music-hall exchanges between comedian and "feed," some of them genuine Irish inconsequence, others mediocre backchat and malapropism. All this pseudo-Brechtian trimming detracts from the growing sense of alarm as Leslie gradually realises his fate and is of doubtful value.

Robert Bolt.

Bolt has recently said, "I do like plays in which the people have ideas as well as predicaments" and he is one of the few dramatists who have scored West End successes with the play of ideas. He holds the balance of discussion so fairly that only in the outcome is it clear that he himself is committed. His earlier work, represented by *The Flowering Cherry* (1957), with Ralph Richardson, was in the realistic convention, but more recently he has experimented with other dramatic techniques, owing something to Brecht and to the Theatre of Cruelty and of the Absurd.

The Tiger and the Horse. 1960.

This play takes its title from Blake's "The Tygers of wrath are wiser than the horses of instruction." It is concerned with the inadequacy of detachment, the philosophy held by Jack Dean, (Michael Redgrave), the Master of an Oxbridge college, the well-balanced man who represents Blake's "horse," while his wife, Gwen, the "tiger," passionately concerned for the world's suffering, shows signs of neurosis. The action revolves round her wish to sign a petition for unconditional nuclear disarmament and Dean eventually, to save her from mental breakdown, bravely identifies himself with her and the cause, thereby deserting his philosophy and his career.

In its outcome the play stresses the value of social idealism, stifled as it may be by philosophic detachment and the pressures of conformity. It is typical of Bolt's dialectic that this value should be upheld by the disturbed Gwen and by Louis, an oddly irresponsible young man.

In this play Bolt departs from the realistic style by trying to make his characters larger than life in being unusually articulate about what they stand for.

A Man for All Seasons. 1960. P.

Here Bolt attempts to give his characters heroic dimensions by striking back into history.

Believing that our need today is a sense of personal individuality or "selfhood," he chooses as his hero of "selfhood" Sir Thomas More (Paul Scofield). More, described by one of his contemporaries as "a man for all seasons," was not only flexibly adjusted to Renaissance society, but also managed to preserve an inner core of unassailable integrity. Suspected of a critical attitude to Henry VIII's divorce, he used his skill in "the thickets of the law," yet resolutely refused to swear the oath to the Act of Succession that would have released him from the Tower and the block, because for him perjury meant the loss of the soul, the self. His constancy is thrown into relief by the growing corruption of Richard Rich, whose final perjury sends More to his death.

More challenges comparison with Brecht's Galileo. He also is a man of supreme intelligence, whose inner certitude of truth is persecuted by an absolute power. He also skilfully avoids open clash until he must eventually make a final choice between astute temporising and commitment of his life to his belief. The difference is that More opts unequivocally for constancy.

Bolt uses what he calls a "bastardized version" of Brecht's style. Episodic scenes are strung along a strong thread of intellectual argument. There is also a commentator in the form of the Common Man, who with the aid of property box takes a swift succession of minor parts, changes of role which throw into relief the steadfast individuality of More.

Bolt, like Brecht, believing that beauty of language is a means of "alienation," matches fine passages from More himself with his own appropriate use of wit and imagery, using images of land to suggest society and its laws and those of water and sea the superhuman context.

The film version, with Scofield, has been highly praised.

Gentle Jack. 1963.

Bolt depicts the conflict between the natural spontaneity of nature, represented by the magic figure of folk-lore, Jack-of-the-Green, in his forest, (Kenneth Williams) and the inhibitions of society in the person of Miss Lazara, financier and plutocrat (Edith Evans). Since Bolt believes that the modern doctrine of the return to nature may lead to violence, Jack finally contrives two murders. The play was not successful. Bolt in dealing with this age-old conflict could not, like Euripides in *The Bacchae*, draw on a familiar and deeply felt myth, and his allegorical plot proved puzzling, while the setting was too reminiscent of *Dear Brutus*. The play is too cerebral, the characters are more blue-prints than flesh and blood.

The Thwarting of Baron Bolligrew. 1965.

A play for children over eight was much praised by the critics as inventive and entertaining.

Edward Bond (b. 1935).

Saved. 1965. M.

Saved, which did not pass the censor, was first presented to the English State Society.

As a result of casual sexual intercourse with the promiscuous Pam, Len gets involved with her morose South London family, with Fred, the putative father of her baby, and with Fred's lewd gang, which murders the baby on the stage.

Since the play is largely in delinquents' argot, and is limited to a photographic study of inarticulate people, it is in itself somewhat inarticulate, but it constitutes a frank and compassionate social document.

Bertold Brecht (1898–1956).

Perhaps the most original and vigorous dramatist and producer of the century, the Bavarian Brecht was remarkable in his command of both literary and theatrical genius.

His practice and theory underwent constant modification. Early plays, like *Baal*, written to provide entertainment, reveal a satiric and anarchic attitude, and in 1928 the ironic *The Threepenny Opera* (P), made him famous. From 1930 onward his work became explicitly communistic, marked by the rejection of the individual in favour of a social ideal. But although Brecht always remained " committed " to Marxist ideology, most of his later plays, written after his withdrawal from Nazi Germany, are less didactic than humanist in spirit and it is by these mature works that he is best known in Britain.

After 1949 Brecht consolidated the famous Berliner Ensemble in East Berlin, where he developed his influential techniques of production.

The most permanent feature of Brecht's mature drama are the Epic form and the *Verfremdung*, or " alienation " effect, both developed in reaction to the traditional dramatic form, which he dubbed " Aristotelian." He considered that the closely constructed Aristotelian play, which encourages the audience's emotional participation in the action, syphons off the spectator's emotion, leaving him a passive and acquiescent member of society.

According to Brecht, the drama should be not ritual but debate. The spectator should be a detached observer, calmly investigating the view of the world that confronts him, rationally considering arguments and stimulated to decisive social action. It is taken for granted that he will find the solution to problems in communism.

Brecht therefore developed his " Epic," or narrative play, loosely constructed with a sequence of individual scenes, functioning as independent dramatic illustrations or quotations to the narrative.

He uses a variety of techniques to establish the narrative tone, such as an actual story-teller on the stage, explanatory verses relayed before the scenes, and banner headlines which foretell the events to be portrayed. Although by throwing the action thus into the past tense, he discards the lure of suspense, his dramatic intelligence, vigour, and inventiveness excite lively interest and curiosity.

To break down the traditional identification of the spectator with the action, Brecht developed his celebrated " alienation " effect, devising techniques to keep him at a critical distance. This implies using an image that suddenly makes the familiar appear strange and novel to the onlooker, so that he is shocked into recognising its significance.

His productions were thus avowedly non-realistic and theatrical, sometimes appearing like an inspired charade. He used not only direct narration but direct address to the audience, formalised settings and properties, masks and stylised make-up, sometimes grotesque in character. His text, " scarcely more than a prompter's copy," was freely adapted during rehearsal, so that an acquaintance with the pattern of Brecht's mime and gesture is often necessary to the full understanding of his plays.

Few find in Brecht's mature work the plea for communism that he intended, and many of his protagonists, designed as exponents of capitalist villainy, appeal strongly to the sympathy. The compelling and fascinating central ambiguity can be ascribed, as Esslin has pointed out, to the tension between Brecht's conscious reason and the unconscious emotional experience on which every creative writer must intuitively draw. This profound tension is the major source of Brecht's power.

Brecht's influence has been pervasive, especially on the dramatists Arden, Bolt, Whiting, and Shaffer, and on the producer Joan Littlewood. Above all his iconoclastic attitude and his fertile experiment have been invaluable in encouraging a new and empirical approach to drama.

Baal. Written 1918.

The amoral vagabond poet, Baal (O'Toole), driven by instinct and emotion, expresses the subjective experience of the youthful Brecht.

Galileo. Written 1938–9. M.

Brecht intended Galileo's recantation as an image of the scientist's allowing the State to assume authority over science. It has also been interpreted as Galileo's cunning expedient, allowing him to continue research.

Mother Courage. Written 1939. M.

In his panorama of war's futility, Brecht designed Mother Courage—a camp follower in the Thirty Years' War—as an epitome of the haggling profiteer. But his intuitive understanding of this dynamic, maternal figure, bereaved eventually of all three children, has endowed her with an ambiguous fascination.

The Good Person of Szechwan. Written 1938–40. M.

Shen Te (Peggy Ashcroft), the benevolent prostitute, has to disguise herself as Shui Ta, the harsh task-master, in order to survive in an unjust commercial society.

Puntila. Written 1940–1.

The drunken generosity of the mean landowner, Puntila, designed by Brecht to highlight his harshness when sober, has however given him an attractive inconsistency. The chauffeur who rejects Puntila's daughter, is a Schweikian character.

The Caucasian Chalk Circle. Written 1944–5. M.

The prologue to this delightful fairy-tale constitutes an overt plea for communism rare in Brecht's later work. The rascally judge Adzak, who takes bribes from the rich and gives judgment in favour of the poor, is one of Brecht's typical contradictory characters.

Peter Brook. Director.

US (or ambiguously *U.S.*). 1966.

US is a collaboration between director, actors, designers, musicians, and writers. It is their attempt to confront the Vietnam war, though it cannot be fully understood or influenced, and likewise to involve the audience in encounter with the terrible fact.

Brook admits anti-American bias because of the giant disproportion between the adversaries and " our own close involvement with America."

The First Act is a violent theatrical assault on apathy. Brook re-employs techniques from Weiss's *Marat-Sade* and alternates utmost stillness, as in the initial mime of a Buddhist self-immolation, with loud music and noise. In the hideous uproar and confusion of a bombing raid at the climax a giant war-effigy from the proscenium crashes across the stage. Shattering assault is succeeded in Act Two by a penetration in depth, its centre being a dialogue between a white man about to burn himself alive and a girl whose cold, detached criticism gradually gives way to a bitter indictment of English parochial indifference. In an ambiguous poetic finale an actor silently releases butterflies, one of which he burns.

This daring and controversial use of theatre directly to involve the emotion of the audience in confrontation with contemporary political tragedy may mark a new departure.

David Campton (b. 1924).

Campton's brief " glimpses " or playlets use techniques of the Absurd, which he considers as

"a weapon against complacency," to expose the actual dangers that threaten society, especially the bomb. His most notable works are the collections of playlets, *The Lunatic View*, 1957, and *A View from the Brink*, 1961.

Albert Camus (1913–60).

It was the French existentialist philosopher and novelist, Camus, who first enunciated the concept of the Absurd, describing it as whatever in human experience is incompatible with man's desire for reason, justice, happiness, and purpose.

Like Sartre, Camus expressed his views through the traditional dramatic form, and the plays most familiar here were those written before he had moved on to a more humanistic philosophy.

Caligula. French publication 1945. P.

The Roman Emperor, Caligula, suddenly decides to act in accordance with the absurdity of the universe and by his violent and perverse crimes forces on the Senators his own recognition of the absurd meaninglessness of existence.

Cross Purposes. French publication 1945. P.

Man's futile desire for happiness is dramatised in the legend of the mother and daughter who murder for gain the visitor to their inn, only to discover they have killed the son of the house. They then commit suicide.

Giles Cooper (1918–66).

Everything in the Garden. 1962. P.

Cooper deftly uses sophisticated comedy for a sharp satire on the sacrifice of principle to money in an effeminate bourgeois society. Four bored middle-class wives become part-time employees in an exclusive brothel, while their complaisant husbands enjoy the tax-free profits. There is a sudden horrifying change of key when at a party a neighbour realises the position and the four men destroy this outsider in a kind of ritual murder. In Cooper's second version the play returns rather shakily to the comic vein. It is interesting to compare Pinter's *The Homecoming*.

Happy Family. 1966. P.

Cooper's last play, outwardly a light, witty comedy, is an incisive, assured satire on arrested development and snobish exclusiveness.

He pictures a completely introverted trio, the well-to-do Mark and his two sisters for whom nobody exists outside the family circle, and who employ their leisure with Meccano, Beatrix Potter, nursery jingles, and the fear of punishment exercised by the sadistic Mark.

When the elder sister introduces a fiancé, Gregory, he acts as a catalyst, for between him and the younger sister there is the first dawning of tenderness and love. But Gregory is also retarded, an only child who hankers for family life, and also a compulsive liar, a grocer posing as a solicitor. He is a "nobody" to Mark who soon contrives that he shall be ousted and the nursery prattle is resumed

The bizarre situation aptly satirises that obsession with the clutter of the past that stifles natural growth and a lack of cognisance of other people which is frighteningly inhumane.

It is illuminating to contrast Triana's use of the same family triangle.

Shelagh Delany (b. 1939).

It is now a decade since Shelagh Delaney, the Salford girl from a secondary modern school, attracted attention with *A Taste of Honey*, 1958 (M). It was followed in 1960 by *The Lion in Love* (M), her last play to be presented.

Although both plays were improved on and produced by Joan Littlewood, they are naturalistic and owed some of their popularity to their fresh and artless picture of the poorer workers and drifters. Verisimilitude in the portrayal of seedy localities was then more of a novelty. *A Taste of Honey* still has significance, both in its unconventional subject, the pregnancy of an unmarried adolescent expecting a black baby and her friendship with a homosexual lad, and also in the direct candour of its emotions. *The Lion in Love* although more mature in outlook is artistically unremarkable.

Nigel Dennis (b. 1912).

Dennis, also a novelist, is a hard-hitting satirist in the tradition of Voltaire and Shaw, and in a Shavian preface to his first two plays he wittily defines his favourite targets. One is the doctrine of Original Sin as preached by Saint Augustine, the other the assumptions of psychoanalysis. He argues that both of these undermine natural self-reliance, and tend to delegate power over the mind to a hierarchy, clerical or medical, which may threaten personal individuality. The Preface is a lively firework display, but Dennis' arguments are sometimes one-sided and negative, more striking than valid.

One of the few dramatists to write in a Shavian tradition, he shows considerable dramatic talent, especially in his vigorous first acts, with their strikingly novel situation and witty and intelligent dialogue. But in the middle of his plays satire gets the upper hand and discussion diverts interest from the characters and tends to hold up the action and to weaken the structure, as in some of the later plays of Shaw himself.

Cards of Identity. 1956.

The play was adapted from Dennis' own novel. The "Mallets," members of a club formed to give people a changed identity, inveigle local people to a country house, where by exploiting psychological techniques they induce them into accepting changed names, memories, and identities and then use them as servants. Only in face of their Bank Manager do the victims rediscover their original personalities.

Dennis uses the adroit situation to illustrate the thesis developed in his Preface. Arguing that the basis of personality is memory, Dennis infers that the psychologist can edit his patient's memories, inject his own viewpoint and so undermine and manipulate personality. This plausible thesis is not verified by any appeal to scientific evidence.

The Making of Moo. 1957.

Compton, a colonial civil servant, has weakened the native taboo on murder by unwittingly killing the river god. He decides to invent the new religion, of Moo (the name suggested by the lowing of cattle), complete with mythology, musical ritual, and ethical code. In this daring satire on revealed religion Dennis exposes similarities between pagan trust in the efficacy of ritual blood sacrifice and the Christian doctrine of Atonement for Original Sin. In his Preface he suggests that to conform to a religious sect is to belong to an Identity Club, which threatens the individuality of its members.

August for the People. 1961.

Opening with a satire on the admission of the public—at a fee—to private "stately homes", the play proceeds to an indictment of the tameness of the common man. It lacks the pungency and inventiveness of Dennis' early work.

Marguerite Duras (b. 1914).

The French novelist and script-writer of the film *Hiroshima Mon Amour*, has recently turned to drama. She has the sensitive novelist's flair for dialogue and for exploring the contradictions and the ebb and flow of feeling in intimate relationships, so that her naturalistic plays move subtly and quietly towards their climax, which is often the agony of parting as in the one-act play *La Musica* (1966. P.).

Days in the Trees. 1966.

Duras's first full-length play is virtually a trio whose theme is the love-hate relationship between mother and son. The now ageing woman had indulged her own emotion by spoiling him, conniving at his playing truant for "whole days in the trees," and thereby undermining both their lives. "I've never loved anybody else," he tells her on her final visit to Paris, but she can no longer hide from herself his callous egoism and misery, as now a gambler and pimp he lives contemptuously with the girl for whom he procures.

Peggy Ashcroft's performance as the mother was widely acclaimed as the finest of her career.

Friedrich Dürrenmatt (b. 1921).

The German-Swss Dürrenmatt acknowledges the Greek dramatists, Shakespeare, and Swift as major influences. He describes his work as "theatre of paradox," revealing "precisely the paradoxical effects of strict logic." He is an unsparing critic of contemporary society, whose dangerous tendencies he exposes in striking and bizarre fictions, reminiscent of the later Shaw.

The Marriage of Mr. Mississippi. 1959.

An extravaganza poses the opposition between two principles carried to their logical and farcical extreme. One is a passion for the law of Moses, interpreted as retributive justice. The other is pure Marxism. The two characters embodying these principles, together with a Quixotic lover, are manipulated and destroyed by an unscrupulous politician.

The Visit.

An old multi-millionairess revisits her birthplace and offers the inhabitants £1,000,000 to murder her former lover, who had denied her paternity order. Gradually persuading themselves that they are acting justly they comply.

Dürrenmatt cleverly maintains suspense in his withering satire on love of money, hypocrisy, and the sycophancy of press and radio.

The Physicists. 1963.

Dürrenmatt has said that this arresting play is not so much about the hydrogen bomb as about society itself and the impossibility of escaping the consequences of one's thinking.

The central character, attempting to suppress scientific discoveries that may lead to the hydrogen bomb, retires to a private asylum pretending to be in contact with King Solomon. There he is first in danger of two spies, pretending to the delusion that they are Einstein and Newton, and eventually of the mad proprietress whose use of his discoveries will lead to the destruction of the human race.

The Meteor. 1966.

Another play of paradox has as hero a man who wishes to die but cannot.

Schwitter (Patrick Magee), famous dramatist and Nobel prizewinner, already proclaimed dead in hospital, returns to the garret of his youth to die. In vain. As the old egoist swaggers, drinks, makes love, one by one those who touch his orbit meet their death.

The symbolism is unclear. Is Schwitter the egoistic kind of artist who feeds on the lives of others? The most effective incident—his dialogue with an ancient tart—cynically suggests that his art also has been prostitution, for he too has supplied artificial emotion to meet public demand.

The chief weakness of the play is that the surprise wears thin. An original idea adequate to a one-act play has been inflated too far.

Charles Dyer.

Dyer's first success was *The Rattle of a Simple Man.*

The Staircase. 1966.

The frankest play concerning homosexuality to be publicly staged is a dialogue between the middle-aged Charles Dyer (Scofield) and Harry C. Leeds (Magee) during a wretched Sunday night in their poky barber's shop in Brixton, the cage they have co-habited for twenty years.

Charlie is sardonic, aggressive, cruel; Harry, "a messy talker" is softer, protective. Their endless squabbling in ribald argot, comic, and searing, vents their exacerbated irritation, but underneath is glimpsed the pain of social isolation, the mother fixation, the frustrated hankering for offspring, the fear of exposure.

Although all proper names are anagrams of Charles Dyer and the author suggests that everything may take place in Charles's mind, Peter Hall's production was firmly realistic.

T. S. Eliot (1888–1965).

In his attempt to revive poetic drama the distinguished poet, T. S. Eliot, was moved by deeply religious and social aims, modestly regarding his work as experimental, "that of the first generation only." The verse he evolved was of a flowing poetic rhythm, "close to contemporary speech" and based on natural stress. Normally he used a line with three stresses and varying length.

In his two plays of the 'thirties Eliot had adopted the ritualistic themes and patterns of Greek drama and had achieved a certain tragic intensity. But the *Cocktail Party* inaugurated a new style, the theme still being Christian redemption and the plot deriving from Greek drama, but the idiom, that of the fashionable comedy of manners. In spite of subtle organisation the liaison has been an uneasy one.

It is curious that the creator of Prufrock should seem unable fully to animate his dramatis personae. This is partly because their inspiration is literary, partly because they are used to illustrate Anglican doctrine and to convey a message. Nor do they belong to the impeccable background against which they are so carefully placed.

The wealth and subtlety of reference of these plays and the beauty of the language make them a delight to the reader, but they are less compelling on the stage.

The Cocktail Party. 1949. F.

This play has its origin in Euripides' tragi-comedy *Alcestis*, the demi-god Hercules being replaced by Reilly, the psychiatrist, whose intervention breaks the back of the play, for it is not easy to sympathise with people who let their actions be so directed.

The Confidential Clerk. 1953.

Described as "high farce," this play derives from another tragi-comedy of Euripides, the *Ion*, whose theme of parents seeking their lost children reappears in Terence, Plautus, and Shakespeare.

The Elder Statesman. 1955.

Eliot here returns to a tragedy, the *Oedipus at Colonus* of Sophocles, but the youthful peccadilloes of Lord Claverton appear pallid compared with the patricide and incest of Sophocles' protagonist.

Jules Feiffer.

Feiffer, the New York strip-cartoonist of international fame, had a one-act play, *Crawling Arnold*, performed here in 1965.

Little Murders. 1967.

The blustering Newquist family of New York embody what Feiffer has called the "national paranoia" in face of "random violence," and when the daughter, Patsy, introduces her fiancé, Alfred, who is so strong that he never retaliates, they are incredulous. But Patsy is killed by some stray bullet, Alfred adopts the Newquist ethos, and the family is happily united sniping down harmless passers by.

The main theme is clear. "Man hates war but is fascinated by it. . . . Peace is a Sissy." The play began as a novel and that may account for the plethora of other stimulating ideas about politics, religious attitudes, and so on which are never fully integrated. It may also account for some highly polished satirical vignettes, most entertaining but self-contained and not entirely relevant.

Brian Friel.

Friel is an Irish short-story writer who has now written four plays.

Philadelphia, Here I Come! 1967.

On the eve of emigrating to America a Donegal boy is torn by memories of his dead mother and his lost sweetheart and is disturbed by farewell encounters and failure to communicate with his taciturn father. His inner conflict is exteriorised by the novel device of two actors playing the same part, one his public the other his private self, which gives occasion for moments of comedy and pathos. Apart from this the play is naturalistic, its shape little more than episodic, and is kept afloat by its Irish poetic eloquence and charm.

Launched at a Dublin Theatre Festival, it had a long run in America before reaching England.

Max Frisch (b. 1911).

Frisch, a German-Swiss who has been influenced by Shaw and Brecht, dramatises current issues in ingenious, apt, and witty parables that have a lucid economy of outline.

The Fire-Raisers. 1961. M.

A delightful Absurdist satire on bourgeois self-delusion and ineptitude shows Biedermann (Alfred Marks) persuading himself that he can cajole the incendiaries about to set fire to his house by inviting them to a good dinner. The situation is analogous to that of Benes of Czechoslovakia who included communists in his government, and to that of the Germans who connived at Hitler.

Andorra. 1964. M.

An incisive and moving satire on the vicious pervasiveness of antisemitism shows the Andorrans' betrayal of the lad Andri, reputedly a Jewish foundling, to the invading totalitarian state. Andri is in fact a Gentile and his assumption of Jewish traits is an example of identity imposed from without by society.

Christopher Fry (b. 1907).

Fry was widely acclaimed in the 'forties for bringing verse back to the stage. His delightful verse, which plays over the surface of his plays like lambent flame, has been compared by Allardyce Nicol to that of the youthful Shakespeare.

Fry has written highly original comedies and religious plays and his work is informed by an implicit spirit of affirmation and hope, conveyed with gaiety and insouciance. He has a gift for devising ingenious situations in terms of poetic fable and metaphor.

Venus Observed. 1950.

Hope Wallace commented on the "dancing, glancing felicity" of this unusual comedy, in which Olivier was protagonist.

A Sleep of Prisoners. 1951.

This original religious play was commissioned for performance in churches during the Festival of Britain.

The Dark is Light Enough. 1954.

An eccentric and saint-like old countess (Edith Evans) gives asylum to men from both sides in the Hungarian rising of 1848. The theme of non-intervention is presented with a lightness and elegance which completely save the play from didacticism.

Curtmantle. 1962.

A historical play concerning Becket and Henry II concentrates on the contradictory nature of Henry. Fry deliberately uses a plainer and rougher verse and some prose.

Athol Fugard (b. 1932).

After working in the Far East and Europe, Fugard now has his own Theatre Group in his home town, Port Elizabeth.

The Blood Knot. 1966.

Of two brothers belonging to the mixed race of "Cape Coloureds," one "tries for white." The dialogue between them, both comic and naïve, and fraught with intense love and hate, is a microcosm of the terrible strains imposed by racial segregation.

Jack Gelber.

Gelber is one of the few Americans to attempt plays of the Absurd.

The Connection.

Beckett's theme of waiting is presented through drug addicts waiting for their dope, to the improvisations of a jazz quartet, but the realistic ending is inconsistent with the Absurdist style.

Jean Genet (b. 1910).

The French Genet, abandoned as a child, has lived as social outcast and criminal and, while politically "uncommitted," has mirrored his bitter repudiation of society in plays of frightening impact.

His dramatis personae have been the rejected murderers (*Deathwatch* (F)), despised servants (*The Maids* (F)), prostitutes (*The Balcony* (F)), Negroes (*The Blacks*), and Algerian peasants (*The Screens*). These have realised their fantasies of sex, power, violence, and revenge only by compulsive ritual acts, so that sequences of arresting ceremonial, sometimes Absurdist, replace character study and coherent plot.

In his destructive scorn of contemporary society, his recourse to rituals of violence, and his incantatory language, Genet satisfies the requirements of Artaud's Theatre of Cruelty.

The Maids. 1956. F.

Two sisters, maids to a fine lady, continually take it in turn to enact the rôle of mistress and maid so that each can vent her envy and rancour on the mistress. When their plot to murder the mistress misfires, one of them herself drinks the poisoned cup of tea.

Their compulsive charade, designed originally for a cast of young men, mirrors the obsessive and self-destroying conflict of envious love and hate in the mind of the outsider.

Triana's *The Criminals* has a similar theme and technique.

The Balcony. 1957. F.

This censored play had its world première at the Arts Theatre Club. It opens in a brothel, where the frequenters enact their fantasies of power by dressing up as bishop, judge, or general, until after an abortive revolution they are called upon by the Court to impersonate these authorities in actuality. Eventually the defeated revolutionary leader visits the brothel to enact the part of Chief of Police, who is then satisfied that his image also has been established in popular regard. The film gives a softened version of the play.

Jean Giraudoux (1882–1944).

Two plays of the French dramatist, Giraudoux, who had stimulated the return of poetry to the stage, were produced here in the 'fifties. *Duel of Angels*, 1953, with Vivien Leigh, was a posthumous work. *Tiger at the Gates*, 1955 (M), with Michael Redgrave, was a translation by Fry of a fine play of 1934. Giraudoux here used the classical legend of Troy as a vehicle for a protest against the stupidity of war.

Willis Hall (b. 1929).

In 1958 Hall was one of the few playwrights giving a candid realistic picture of the under-privileged, as in his best play *The Long and the Short and the Tall* (P) about soldiers trapped in the Malay jungle in 1942. He later collaborated with Waterhouse in North country comedies such as *Celebration* and *Billy Liar*.

David Halliwell.

Little Malcolm and His Struggle Against the Eunuchs. 1965. F.

A deliciously funny send-up of the angry young man cult is located in a Huddersfield garrett. Here Malcolm, a beatnik ex-art student, compensates for his inadequacies—professional and sexual—by fantasies of Hitlerian power. He imposes on his three chums his farrago of "Dynamic Insurrection", which so distorts reality that they all finally beat up the nice girl who wants to help Malcolm.

The sources of disaffection and violence are scrutinised incisively but with sympathy.

Michael Hastings.

Hasting's *Don't Destroy Me* was produced when he was 18. *Yes and After* (P) appeared in 1957.

The Silence of Lee Harvey Oswald. 1966. P.

The play, an example of "living theatre," begins with a straightforward narrative of the assassination of Kennedy, illustrated by film sequences and stills.

Unfortunately Joan Littlewood made such alterations to the text—transposing much of the verse to prose and adding or omitting characters—that the significant parallel to Shakespeare has been blurred and the satirical impact blunted.

Mrs. Wilson's Diary, which takes the form of a jolly pre-war musical comedy, is described by its authors, Richard Ingrams and John Wells, as "an affectionate lampoon" on Wilson's administration.

The Hampstead Theatre.

The Hampstead Theatre Club, now London's first Civic theatre, under the energetic direction of Roose-Evans, has sponsored many aspiring playwrights. It has to its credit the world premières of plays by dramatists such as Giles Cooper, Pinter, Milner, Howarth, Bowen, McGrath, and recently even Tennessee Williams, a rare distinction.

III. GLOSSARY OF DRAMATIC TERMS

Absurd Drama.

The Theatre of the Absurd, originating in Paris, was introduced here through the plays of Beckett and translations of Ionesco, Vian, and Vitrac. It has had considerable impact on Pinter, N. F. Simpson, Saunders, Stoppard, and Campton, while American absurdist plays by Albee, Gelber, and Kopit and by the Swiss, Frisch, have also been produced here.

The concept of the Absurd was first formulated by Camus to indicate the discrepancy between human reason and aspiration and an indifferent and hostile universe. But like Sartre he expressed his convictions through the traditional dramatic form.

Not every playwright of the Absurd is an existentialist and many are more concerned with an irrational human society than with the universe. What they have in common is a technique. All have discarded traditional realism and express absurdity through images that are themselves absurd, including bizarre situations and objects, both sad and comic, such as aged parents consigned to dustbins.

There is in the Absurd an element of Surrealism and Miss Bradbrook has suggested that a better term might be Theatre of Dream, for it is the unconscious dream mind that juxtaposes objects and incidents that in the waking state have no connection, such as a rhinoceros in a provincial street. Pinter seems to have an intuitive awareness of the hinterland of dream, while Simpson makes a conscious manipulation of Surrealism.

Frisch has ably demonstrated that the Absurd can be an effective vehicle for satire and many absurdist writers, such as Ionesco and Simpson, have satirised the modern prostitution of language corrupted by salesmen and politicians, and have used conversation of vapid emptiness to reveal its breakdown as a means of communication.

It is partly because of their distrust of language that they have had recourse to ludicrous objects and images, thus extending the range of total theatre.

The Aristotelian Play.

Brecht and Ionesco have disparagingly referred, somewhat inaccurately, to "Aristotelianism." Strictly speaking, this means the concept of tragedy which Aristotle first analysed in his *Poetics*, basing it primarily on the poetic tragedies of Sophocles, especially the *Oedipus Rex* (P), *c.* 425 B.C. The Aristotelian concept, revived since the Renaissance, has obviously been much modified, but certain basic principles can still be discerned.

Aristotle claims that poetry in general aims at that rational pleasure which is part of the good life. He defines tragedy as the imitation of an action complete in itself and stresses its inner coherence. Tragedy must have an intelligible beginning, a middle necessitated by the beginning and which itself necessitates the end. "The story . . . must represent one action, a complete whole, with its several incidents so closely connected that the transposal or withdrawal of any one will disjoint and dislocate the whole."

The action should be of some magnitude, with "incidents arousing pity and fear wherewith to accomplish the purgation of such emotions." Here is Aristotle's celebrated doctrine of purgation or "catharsis" which has been variously interpreted, some considering that something like a ceremonial purification is intended, with an ethical end in view, others that bodily or psychological relief from tension is meant.

Aristotle emphasised the paramount importance of action or plot, the characters being revealed in and through the action. The kind of plot recommended is one where the hero is an eminent man, neither inordinately good nor bad, whose misfortune is brought upon him by some error of judgment.

Here is the germ of the splendid Renaissance tragedy concerned with the fall of princes and also of the modern finely constructed play, such as Ibsen's *Ghosts*. Such a play has classical symmetry, the beginning, middle, and end, becoming in modern parlance the exposition, development, and climax or denouement. It has its own organic unity and inevitability. But although many writers, such as Sartre, still work within the classical disciplines many have discarded the traditional form.

Brecht and his followers have repudiated the whole pattern in favour of a sequence of self-contained episodes strung along a narrative thread, where ironic detachment supersedes the emotional involvement and catharsis of Greek tragedy.

In this day of the common man few are concerned with the fall of princes, and it is interesting to examine some of the more striking modern plays and to ask how far they stand up to the Aristotelian canon. Should a new concept of tragedy be evolved, that of potentiality unrealised, not a fall from greatness but a failure to rise?

The Brechtian or Epic Play.

Many British dramatists have felt the pervasive influence of the Bavarian Brecht (*q.v.*), who developed a new kind of Epic or narrative play of debate, with a loose sequence of episodic scenes linked by commentary or songs. Discarding realism, Brecht attempted not to arouse the onlooker's emotions but to stimulate him to think about social issues and to take left-wing action. In the event his ambiguous central situation appealed to deeper levels of experience.

There have been several instances of the ambiguous protagonist, but English playwrights have tended to adopt not the political intentions but the style of the Epic genre. Esslin has said that Shaffer in *The Royal Hunt of the Sun* has joined "Bolt, Arden and John Whiting of *The Devils* in the select group of British dramatists who have genuinely benefited from the conception of epic . . . techniques in drama."

Theatre of Cruelty.

In 1938 Antonin Artaud published *The Theatre and its Double*, a collection of essays and letters, which forms the theoretic basis of the Theatre of Cruelty, his central purpose being a ritual of cruelty to exorcise fantasies.

Professor Brustein has described how Artaud hated industrial civilisation, believing, like Freud and D. H. Lawrence, that it stifled instinctual life. He claimed that the theatre, as the heart of a common culture, should enact a primitive ritual of cruelty, a sacrificial frenzy and exaltation. In this way it would bring to the surface and exorcise the spectator's latent anarchy, violence, and eroticism, serving as an "outlet for repressions."

Artaud envisaged a total theatre, appealing to total man, primarily visual, where the all important Director would deploy "music, dance, plastic art, pantomime, mimicry, gesticulation, intonation, architecture, scenery and lighting" to induce a state of trance. Attacking the inadequacy of a pallid conceptual language, Artaud demanded that dramatic language should have an emotional and incantatory effect.

It is Genet who most closely fulfils Artaud's demands and in England the specific Theatre of Cruelty has been best represented by his plays, the *Marat-Sade* of Weiss, and Triana's *The Criminals*. But the methods of production advocated by Artaud have had a wide and pervasive influence on the movement towards total theatre.

Expressionism.

One of the most notable contemporary revivals of Expressionism is Wesker's *Chips with Everything*. The genre flourished in Germany after the First World War, where its chief exponents were Kaiser and Toller, and in Czechoslovakia in the plays of Capek. O'Neill and O'Casey have also occasionally experimented with Expressionism.

Reacting from Realism with its insistence on individual psychology and the detailed representation of actual life, Kaiser, Toller, and Capek sought to express rather the general aspirations and fears of humanity, especially man grappling with the advent of machinery. Their characters are symbolic types, as the Nameless One, representing the mob in Toller's *Man and the Masses*. Their decor is stylised, the dialogue staccato, and the brief scenes are characterised by mass movement and swift action.

Naturalism.

Naturalism in drama may be regarded as a special case of Realism, and it is not easy, nor perhaps always desirable, to make a sharp distinction between the two.

Naturalistic drama attempts to record as faithfully as possible the actual experiences of life, however banal, and to present life, undistorted by the playwright's theories or too much concern for artistic form. The virtues of Naturalism are fidelity and spontaneity. Its danger is that it may keep so close to life as to lose artistic form and tension, becoming the stage version of the tape recorder. *See* **Slice-of-Life Play.**

It was Zola in the 1870s who propounded the principles of Naturalism. Distrusting both the play of ideas and the well-constructed play as tending to impose on life a falsifying and artificial pattern, he urged that drama should record as objectively as possible the actual course of man's life, especially the way it is conditioned by environment.

Strindberg's *Miss Julie*, 1888, is an essay in Naturalism but the genre is found in its most accomplished form in the Russian theatre, especially in Stanislavsky's production at the Moscow Art Theatre of the plays of Chekhov and in 1902 of Gorky's *The Lower Depths*.

Neo-Realism.

There is nothing new in dramatic Realism (*q.v.*) as such. What is novel is the realistic presentation of the shabby lodgings and streets of the underprivileged. Gorky in *The Lower Depths* was perhaps the first dramatist to reveal the wretched condition of the destitute and this play influenced O'Neill's *The Iceman Cometh*. Their recent production in London, with a starkly realistic background, had some effect on those contemporary plays where the kitchen-sink and dustbin are as much in vogue as was formerly the fashionable drawing-room.

Any worth-while play has significance far beyond its milieu and modern neo-realistic plays vary greatly in theme and purpose. Wesker, Delaney, Livings, Owen, Osborne, Orton, Bond, Lawler, and Seymour have all used the style in differing ways.

Several of these playwrights have themselves been workers and their plays are an authentic interpretation of their own culture, once inaccessible to the middle-class audience. The fact that their work is occasionally loose in structure may be attributable to the influence of Naturalism (*q.v.*) or to the author's unacademic background. The advent of this fresh and vigorous drama from a group that has seldom been articulate is one of the most encouraging aspects of modern theatre.

Realism.

Writers of realistic drama, such as Galsworthy, attempt to create a stage illusion of actual life, usually through the medium of the well-constructed play. It is not always easy to distinguish between Realism and Naturalism—its extreme form—but one salient difference is that the latter tends to discard organised plot as imposing a false pattern on the flux of life.

Bolt, Cooper, Mortimer, Shaffer, and Porter have all written realistic plays, and since the 'fifties there has been a succession of competently constructed realistic plays associated with the novelists, Graham Greene, C. P. Snow, and Muriel Spark.

The Satirical Play.

Recent years have seen heartening revivals of plays by Shaw, triggered off by Stage Sixty's production of *Widowers' Houses*, with its topical relevance to Rachmanism. There followed a long succession of Shaw revivals, including *Too True to be Good*, from the Edinburgh Festival, *You Never Can Tell*, with Ralph Richardson, and *Heartbreak House* from Chichester.

Shaw has found few successors, for genuine satire is a most demanding art. Subjective hostility and negative criticism are not enough. The motive power in Ibsen and Shaw was rational indignation, a most difficult fusion of strong emotion and objective reasoning, and their satire was constructive in that it implied and indicated positive values. It was also characterised by a precise aim at a specific target. Vague and wholesale denunciation diffuse a disagreeable tone which has a boomerang effect for it becomes associated not with the targets but with the playwright himself.

The graces of satire are detachment, irony, and wit and it flourishes apparently in a stable society such as that of the 18th century, which produced Swift and Voltaire. The European upheavals of the last half century have been unpropitious for satire and it is significant that the best plays in this genre, those of Frisch and Dürrenmatt, have come from neutral Switzerland.

The English playwright nearest to Shaw is Nigel Dennis, and Giles Cooper shared his ironic detachment.

The " Slice of Life " Play.

Here is an extreme kind of Naturalism, where the author has been so anxious to preserve fidelity to the natural spontaneity of living, that he has all but discarded form, as having a cramping and distorting effect.

One of the most typical examples is Henry Chapman's *You Won't Always Be On Top*, showing the disconnected minor incident and talk of men ostensibly " at work " on a building site. Shelagh Delaney's *The Lion in Love* is also in this vein.

Verse Drama.

During the 20th century several attempts have been made to revive drama in verse—the normal vehicle for the Renaissance playwright. Although the verse plays of Shakespeare and his contemporaries, kept alive in excellent revivals, still rise like the Himalayas above the contemporary scene, the dramatist today who tries to use verse has not the benefit of an unbroken tradition. Yeats, T. S. Eliot, and Christopher Fry all succeeded for a time in getting their verse plays on to the stage but at the moment the most successful poetic drama achieves its effect through poetic prose and the theatrical poetry of its situation and stage imagery. Dylan Thomas' *Under Milk Wood* successfully used these media. For many contemporary audiences it is Beckett, Arden, and Pinter who have captured the poetry inherent in drama.

The finest verse play seen on the English stage for many years is Robert Lowell's *Benito Cereno*.

The Well-made Play.

The term " well-made play " is most frequently used in a derogatory sense. Eric Bentley has pointed out that the " well-made play " is a form of classical tragedy, degenerate in that although the plot is ingeniously contrived, with arresting situation, intrigue, and suspense, the play is

mechanical and devoid of feeling. The television series, *The World of Wooster*, is an example.

The expression was frequently used disparagingly of the French plays of Scribe and of Sardou, ridiculed by Shaw for his "Sardoodledum."

IV. DIRECTORY OF DRAMATISTS

This part, alphabetical in arrangement, includes dramatists whose work, whether English or in translation, has had its British première since 1950. Unless otherwise stated the quotation of date and actor refers to the British première.

Inexpensive paperback editions are referred to thus: F: Faber and Faber. M: Methuen. P: Penguin.

Arthur Adamov (b. 1908).

Adamov first wrote plays such as *Professor Taranne* (P), which translate his own personal neuroses into images of the absurd, until with the propagandist *Paolo Paoli* he adopted a Brechtian technique. His *Spring 1871*, an epic panorama of the Paris Commune, had its world première in London in 1962.

Edward Albee (b. 1928).

The American Albee, an adopted son, is a brilliant satirist of his society.

The Zoo Story. P.

An absurdist one-act dialogue reveals a schizophrenic's failure to communicate—even with a dog—and ends with his self-immolation.

The Death of Bessie Smith.

The neurotic refusal of white hospitals in Memphis, in 1937, to admit the injured Negro singer is realistically presented.

The American Dream. P.

In an absurdist satire the newly adopted son proves to be a facile devitalised youth and an unscrupulous materialist.

Who's Afraid of Virginia Woolf? 1964. P.

A brilliant and scarifying satire on sterility in an American campus uses a ritual movement. George and Martha, named after the Washingtons, are an unsuccessful and childless middle-aged couple. They cherish a fantasy "son," whom George, to spite Martha, symbolically "murders" during a liquor-ridden night party, when they attack each other and their guests (a young couple also childless) with ferocious mental cruelty.

Jean Anouilh (b. 1910).

Anouilh is a playwright of remarkable theatrical versatility and skill. Following Giraudoux, he has frequently employed classical themes, as in *Eurydice* (M), and *Antigone*, 1949 (M), with Olivier and Vivien Leigh. More recently he has treated historical figures, Saint Joan in *The Lark* (M), and Becket in the play of that name (M). The play within a play is a favourite expedient of his and he used it again in *The Fighting Cock* (M), produced at Chichester, 1966.

Anouilh's outlook is deeply pessimistic. A recurring theme is that purity is incompatible with experience of life and many of his protagonists say, "No." His plays fall into two categories—the fatalistic *pièces noires* and the romantic fantasies, *pièces roses*.

They have been extraordinarily popular on the London stage of the 'fifties and Anouilh's amoral attitude has been reflected in many West End successes.

Aleksei Arbuzov (b. 1908).

The Russian producer and playwright Arbuzov has been writing since 1930.

The Promise. 1966.

In the best tradition of naturalism *The Promise* is a moving and positive work free from both illusion and despair.

During the siege of Leningrad three adolescents, two boys and a girl, contrive to survive in a bombed house, and here in brief episodic scenes their hardship, gaiety, and the slow awakening of love are shown with a delicate and touching naturalism.

Four years later Lika must choose between the two men and although she loves the engineer Marat she chooses the dependent, poetic Leonidik. The decision brings fulfilment to no one and finally Leonidik courageously summons back Marat and leaves him and Lika together, a conclusion analogous to that of *The Caucasian Chalk Circle*.

John Arden (b. 1930).

Arden is a vigorous and gifted playwright, who has experimented with a variety of subjects and methods, sometimes too original and complex to find quick acceptance.

His characters are full-blooded and rich in human contradictions, and he has sympathetically brought to life even such bogeys as Herod and King John. He loves to dwell on some ambiguous personality, where generosity conflicts with violence, and to consider the problems of directing man's unruly vitality.

His favourite theme is the dispute between instinctual energy and good government and he pleads the case cogently for both sides, giving no facile judgment or direct "message," unless it be "the recognition of the fallibility of man." Thus although, like Brecht, he is deeply concerned with social and political dilemmas, he remains politically "uncommitted." He is above all the dramatist of the dilemma.

There has been a fruitful cross-fertilisation of Arden's interest in current events and his literary studies; and his historical plays, like Brecht's *Mother Courage*, combine a fine sense of period and a sharp relevance to some current issue.

Arden's plays are poetic in structure, depending in part on the recurrent image and metaphor and, like Arthur Miller in *The Crucible*, he has skilfully devised for each an appropriate dialect of time and place. At the same time he has a keen sense of theatre, and has successfully adapted techniques from Miracle plays, Elizabethan drama, music-hall, puppet stage, and Brechtian epic play.

Live Like Pigs. 1958. P.

Seventeen realistic scenes, full of comic and frightening incident, reveal how tensions develop between households at different social levels in a council housing estate. The authorities—a well-meaning local official (Alfred Lynch) and a police sergeant (Stratford Johns)—fail to forestall a violent and fatal conflict.

Most of the scenes are prefaced, in Brechtian style, by verses of the old street-ballad type, sung with monotonous melancholy. This device gives a sense of the universal nature of human discord in an otherwise firmly particularised time and place.

The Happy Haven. 1960. P.

Here, in a good-tempered satirical fable, enlivened by a dash of magic, Arden touches on problems of longevity.

Doctor Copperthwaite, the superintendent of the Happy Haven, an old people's home, is, like a mediaeval alchemist, bent on producing an Elixir of Life and Youth, intending to use his five unsuspecting patients as guinea-pigs. But outwitted by them he is himself transformed into a small boy.

The theme is childishness. The egocentric demands of the very old are seen as amusing childish foibles, while Doctor Copperthwaite, so absorbed in his research as to forget ends for means, brings childishness on himself.

In form the play is an extended puppet show. The characters wear masks, the set is formalised, and there is even a dog, Hector, but unlike Dog Toby he is visible only to the dramatis personae.

Serjeant Musgrave's Dance. 1959. M.

For a fine play, which explores the ethical dilemma of war, Arden drew on two sources—contemporary events in Cyprus and a journal written by a deeply devout N.C.O. during the Crimean War. He has fused his material into vivid incidents, which he projects against the background of a fictitious colonial war of the 1880s.

In a frost-bound colliery town there arrive three private soldiers, led by the dominating Serjeant Musgrave. They claim to have come recruiting but are in fact deserters from a colonial war.

In spite of his rigid sense of military duty, Musgrave had been horrified by the terrible five-fold reprisals taken by the British for the assassination of a comrade, Billy Hicks. Believing himself to be God's agent, he has now come to Billy's town, obsessed by one purpose, to expose war's horrors.

Exhibiting Billy's skeleton in the market-place, he at first wins sympathy in his denunciation of atrocities. Then bewildered by his own confused "logic," he demands twenty-five deaths in return for the five taken by the British and turns the gatling on the astonished crowd.

Suddenly, with the thaw, the Dragoons arrive and Musgrave finds himself awaiting execution, stunned that no one has learned the lesson he yearned to teach.

Fierce incident and macabre surprise are used for a play of ideas which enunciates no facile answer. It is typical of Arden's fair and non-doctrinaire approach that the dilemma of the religious man in face of war should be embodied in the fanatical and confused Musgrave. This has sometimes misled the audience, but the spirit of compassion implicit throughout the play is clearly revealed in the gentle, pacific Private Attercliffe, who is also to be executed with Musgrave. The women's parts are also significant, especially that of Mrs. Hitchcock, the owner of the inn, who visits Musgrave in prison and shows him how he had erred in trying to use war itself to end war. In his darkest despair she gives him hope, and it is symbolic that he accepts drink from her hand.

The complex play weaves together many tensions; harsh discord between colliery owner and strikers; contention between the three privates, each of whom is strongly individualised; the discrepancy between a woman's love and the careless soldier's life; Musgrave's own bitter inner struggle.

The dialogue has a wonderful period character and the soldiers' ballads and lyrical songs occur with complete naturalness.

The Workhouse Donkey. 1963. M.

Styled by Arden as a "vulgar melodrama", this ample Brechtian play shows jockeying for power in a northern town between the Tory Alderman Sweetman, a wealthy brewer, and Alderman Butterthwaite (Frank Finlay), the Labour ex-mayor. Both attempt to manipulate the police and to enlist the support of the electorate, represented by the shifty turncoat Doctor Blomax, until all these four elements of the community are deeply corrupted.

Butterthwaite, called "the workhouse donkey" because born in the workhouse, is the dominating Rabelaisian character. A Dionysiac figure, he is drunken, lecherous, and amoral, yet devotedly loyal and generous. Finally in an attempt to help the treacherous Blomax he robs the Borough safe and brings disaster on himself and the town.

Arden says, "The personality of the late Mr. Joseph D'Arcy of Dublin inspired much of the play."

Armstrong's Last Goodnight. 1964. M.

The old "Ballad of Johnie Armstrang," *c.* 1603, forms the framework of a play concerning the dilemmas of government. Armstrong of Gilnockie, the Scots Border laird, freebooter and rebel, is invited to a meeting by the young Scottish King James V and then treacherously hanged. Arden has introduced into this stark story the historical character of the king's herald, Sir David Lindsay, poet and politician, and shows him at first striving by devious diplomatic expedients to persuade Armstrong (Albert Finney) to loyalty, before he finally advises force. The play is diversified by minor characters and incidents which sometimes, however, overcomplicate and obscure the impressive ballad line.

The introduction of Lindsay was suggested to Arden by his reading of Conor Cruise O'Brien's book *To Katanga and Back*, for he was struck by "a basic similarity of moral" between 20th-century Africa and 16th-century Scotland, the rôle of O'Brien being similar to that which he invents for Lindsay.

Arden makes free use of Elizabethan pageantry and of Brechtian ballad-singing and the setting is the mediaeval convention of "simultaneous mansions," Gilnockie, the Border, and the Court all being formally represented on the stage at one and the same time.

Arden "constructed" a dialect to suggest the place and period, but for the English audience it is not easy to follow, especially as Armstrong himself has a marked impediment in his speech.

Left-handed Liberty. 1965. M.

When commissioned by the Corporation of the City of London to write a play to commemorate the 750th anniversary of the sealing of Magna Carta, Arden made a careful study of the historical facts, which he presents with very little transposition and addition.

He approaches his theme of liberty from an unusual angle, showing the aftermath of Runnymede in the apparent failure of the Charter, and demonstrating that the agreement had to take place in people's minds before it could become effective.

It is typical of Arden that he does not present a clash of black and white. John is a rounded character, a slippery villain, but shrewd and energetic and gifted with the Plantagenet charm, while some of the barons are coarse and unscrupulous fighters.

The use of stylised scene emblems, such as charts, maps, and views of Runnymede, give mediaeval colour to the simple stageing and Arden has again invented a suitable dialect.

The Royal Pardon. 1967. M.

A play for young teenagers, that developed out of bedtime stories for the Arden children, was written in collaboration with Margaretta D'Arcy.

Isaac Babel (1894–1941).

Between 1937 and 1957 the work of Babel, the Russian Jewish short-story writer, was banned in Russia. He died in Siberia. *Sunset*, the first of his two extant plays, produced in Russia under Stanislavsky in 1928, appeared on B.B.C. television in 1964.

Marya. 1967. P.

Written in 1933 but not yet professionally produced in Russia, *Marya* is set in Petrograd in February 1920. It evokes a precise period in history—the flux and confusion just before the Bolsheviks consolidated their power in March 1920.

The organisation of the play is poetic, the balance and interplay between two social milieus. One is the decayed elegance of the liberal intelligentsia focused in the home of Mukovnin, a former General, where the men are well-disposed but impotent, the women unchaste. The other is the squalid house where Dymschitz, the Jewish merchant turned black-marketeer, lives with his hangers-on and crooks.

As in Chekhov, the characters are studied in psychological depth and the quiet naturalism of the style is sometimes startled by sudden violence as in the shootings after the rape of Ludmilla, Mukovnin's younger daughter, and the link between the two households.

The play is also shot through with symbolism. It is significant that Marya, the General's energetic elder daughter, never appears in the play. She has left the scene of confusion to serve at the Front and in the final scene a peasant couple, the wife pregnant, are brought up from the basement to occupy the once fashionable Mukovnin apartment.

James Baldwin (b. 1924).

Baldwin is an American Negro novelist and essayist, and a champion of Civil Rights.

The Amen Corner. 1965.

Acted by a Negro cast including singers of Spirituals, the successful play gently probes the genuine and the self-deluded elements in religious experience.

Samuel Beckett (b. 1906).

Beckett, an Anglo-Irishman, who has made his home in France, is both novelist and the most distinguished of the English dramatists of the Absurd. His world is drastically limited, peopled chiefly by old men awaiting their death, but it is the profoundly tragic world of Lear in the storm and it is conceived with the intensity and haunting power and suggestiveness of the true poet.

His work is poetic in its verbal imagery, sometimes as searching and macabre as that of Webster, and his dramatic prose has an underlying poetic rhythm often more flexible and effective than that of Eliot's verse. In structure his plays have a poetic symbolism, a latent significance, like that of the novels of James Joyce, Beckett's close friend, and their striking visual imagery has a kind of theatrical poetry, as for instance the two tramps at the foot of a bare tree in *Waiting for Godot*. It is remarkable that so literary a playwright should also have succeeded with the wordless mime play.

Beckett's chief weakness as a dramatist is that the action and visual imagery are frequently too static, as in the motionless dustbins in *End Game*, much less effective theatrically than Ionesco's movable chairs.

Waiting for Godot. 1955. F.

This tantalising and compelling tragi-comedy, Beckett's masterpiece, originally written in French and produced in Paris in 1953, was later translated and performed in more than twenty countries.

Character and incident are pared to the bone and only a skeleton situation remains. At evening, on a desolate road, bare but for a single tree, two wretched tramps, Vladimir and Estragon, wait for a mysterious Mr. Godot. As they while away the time with desultory talk and clowning, a tragi-farcical diversion is provided by the entry of Pozzo and Lucky, bullying master and wretched slave, and a boy later brings a message that Mr. Godot cannot come but will arrive the next evening. After discussing whether or not they shall hang themselves from the tree, the tramps decide to go away for the night, but remain on the spot.

Act II presents "Next day, same place," the only difference being that the tree has sprouted a few leaves, and the basic pattern of Act I is repeated.

Although by the skilful use of music-hall techniques Beckett presents his tramps in the guise of amusing clowns, they are at the same time pathetically human as they waver between suicide and irrational hope. A fretful affection has kept them together over fifty years, and their dispositions are complementary, possibly even representing different aspects of the one personality. The practical and extrovert Vladimir, nicknamed Gogo, may depict man's intellect, his executive powers, the ego, while the more poetical and introvert Estragon, nicknamed Didi, may represent the body, instinct, the id.

Pozzo and Lucky, another pair of contrasting characters, are portrayed more farcically. The loud, confident Pozzo drives Lucky in as if he were a beast of burden. Lucky carries in his mouth the whip with which he is beaten and humbly obeys every insolent command. He dances for Pozzo and even thinks for him. In their second appearance Pozzo is blind and Lucky deaf.

They may be considered personifications respectively of master and slave, worldly materialism and higher values, the physical and the intellectual, body and soul, or the two aspects of a sado-masochistic relationship.

The play as a whole is a most complex dramatic symbol expressing man's anxiety and suffering as to his origin and destination.

The uncertainty is symbolised by the characters' confusion as to even the physical actualities of time and place, but the dominating symbol is the tramps' doubt as to Godot's identity and purpose.

Such an oversimplified interpretation as to equate Godot with God is inadequate, yet the play has undoubted Christian references. A tree is frequently used as an emblem of the Cross. Beckett, questioned about its theme, quoted a wonderful sentence in Saint Augustine, . . . "Do not despair; one of the thieves was saved. Do not presume; one of the thieves was damned."

Beckett neither affirms nor denies Saint Augustine's statement but inverts it into a question, more distressing than direct denial. Can we any longer accept the existence of divine grace and judgment? It is a question such as this that gives to the play its symbolic shape of doubt, and which is cogently expressed in the theatrical image of two outcasts at the foot of a tree, a tree of life which puts forth leaves, a tree of death which they contemplate using as a gallows.

Yet the significance of the play is even deeper than an exploration of religious doubt, its appeal wider and more contemporary. The anguished uncertainty of the 20th century is whether life has any meaning whatsoever and the play shows the suffering of man, lost and anxious in an apparently meaningless universe.

Some have considered it to be written from the point of view of existentialism: continuing vainly to hope for a supernatural revelation, the tramps lack the courage to come to terms with the nothingness of our existence and the need to choose and create our own destiny.

A Jungian psychologist, Eva Metman, has made a similar interpretation, remarking, "Godot's function seems to be to keep his dependents unconscious."

"Habit is a great deadener," says Vladimir. If Beckett's play enables the audience to escape the drug of habit and to face this image of anguish and so find some relief, then it may have the therapeutic value of that inner knowledge advocated by Freud and Jung.

It is not a play for those who cannot bear to suffer. When performed in San Francisco Gaol, the first play there for forty-four years, it held its audience of fourteen hundred convicts spellbound. They realised that each must find his own personal message. All knew that it spoke to those who must suffer and wait.

Endgame. 1958. F.

Also re-created from the French, this play again depicts a static situation. In a single, claustrophobic room, the selfish, materialistic Hamm, who keeps his senile and legless parents in dustbins, is now paralysed and blind and dependent on his servant Clov, who longs to leave him. But if Clov should leave, both would die, for Hamm owns the only store of food in a devastated and dead world. Finally Clov sees outside what may be a small boy, "a potential procreator," and he prepares for departure but remains immobile.

The play like poetry can be interpreted in several ways. Since Hamm and Clov are mutually dependent, it probably represents tension between complementary aspects of personality, Hamm sensation and emotion, and Clov intellect. As Clov has vision and sees the boy, the situation suggests the struggle of the mystic endeavouring to escape from a deadening materialism to a vital awakening of the spirit. It may also depict a period of traumatic depression when the whole external world seems dead and unreal. The play's overall impression is that of the dissolution of the personality in death, both personal and global.

Endgame lacks the wry humour of *Waiting for Godot*, and is less compelling than Ionesco's *Exit the King*, but is more potent in its latent imagery than is Ionesco's play.

Krapp's Last Tape. 1958. F.

In the briefest sketch, Krapp, a solitary, decrepit, unsuccessful old man listens to his own autobiographical tape-recording of thirty years ago, but the moment of miraculous insight it commemorates is now so meaningless to him that he switches off that section of the recording and broods on a description of his love-making.

Beckett employs a most effective stage device to pose contemporary queries as to the limitations of verbal communication and the continuity of personal identity.

Happy Days. 1962. F.

Here again the paralysis of later life is indicated. A woman talks ceaselessly, although progressively buried in a mound of earth until it reaches her neck.

Beckett's two "Mimeplays without Words" are in striking contrast to the plays in that all is conveyed in symbolic wordless action.

Brendan Behan (1923–64).

Behan, a Dubliner, and author of the autobiography, *The Borstal Boy*, used his own experiences in the I.R.A. and as political prisoner to give substance to his two unusual plays.

The scripts of both were sent to Joan Littlewood and considerably altered, especially in the deletion of "chunks of terrible sentimentality," while the length of *The Hostage* had to be trebled. Lacking in structure and depth of characterisation, they are vividly impressionistic, lively, and voluble. As Tynan says, "Language is out on a spree, ribald, dauntless and spoiling for a fight."

Because they are presented in comic terms, Behan's strong social convictions are fully integrated in his plays. *The Quare Fellow* is an effective plea for the abolition of capital punishment and *The Hostage* makes the business of war seem extremely childish.

The Quare Fellow. 1956. M.

The scene is an Irish gaol during the twenty-four hours immediately preceding the execution at 8 a.m. of "the quare fellow," who has brutally killed his own brother. Farcical and macabre happenings succeed one another, as the unnerving effect of impending death is shown on both prisoners and warders, while a recurring song from the punishment cell sounds a melancholy refrain. The sombre theme is presented obliquely, masked by the harsh irony of prison jests, and although the play has little plot it is remarkably tense, partly because we never see the condemned man. Much is also due to Joan Littlewood's skill in redistributing dialogue and tightening the structure.

The film version completely distorted the disciplined and claustrophobic atmosphere of the play.

The Hostage. 1958. M.

Again the basic situation is the waiting for an execution. The scene is an old Dublin house, once the refuge of the I.R.A., now a brothel. Irish patriots bring here a captured Cockney private soldier, Leslie Williams, as hostage for an Irish boy, now a political prisoner in Belfast, who is to be executed next morning.

Teresa, the gentle little Irish maid, reared in a convent, tries to save Leslie. There is touching pathos as these two orphans, neither of them understanding what the strife is about, recall their childhood, and when in a raid on the house Leslie is shot, Teresa utters her lyric lament. But the mood is only held for a moment. Leslie leaps up and sings "The bells of hell go ting-a-ling-a-ling," and the play ends.

The mood is much less consistent than that of *The Quare Fellow*. Here the comedy is chiefly a diversion supplied by a host of minor characters. The action is constantly held up for songs more or less satirical and music-hall exchanges between comedian and "feed," some of them genuine Irish inconsequence, others mediocre backchat and malapropism. All this pseudo-Brechtian trimming detracts from the growing sense of alarm as Leslie gradually realises his fate and is of doubtful value.

Robert Bolt.

Bolt has recently said, "I do like plays in which the people have ideas as well as predicaments" and he is one of the few dramatists who have scored West End successes with the play of ideas. He holds the balance of discussion so fairly that only in the outcome is it clear that he himself is committed. His earlier work, represented by *The Flowering Cherry* (1957), with Ralph Richardson, was in the realistic convention, but more recently he has experimented with other dramatic techniques, owing something to Brecht and to the Theatre of Cruelty and of the Absurd.

The Tiger and the Horse. 1960.

This play takes its title from Blake's "The Tygers of wrath are wiser than the horses of instruction." It is concerned with the inadequacy of detachment, the philosophy held by Jack Dean, (Michael Redgrave), the Master of an Oxbridge college, the well-balanced man who represents Blake's "horse," while his wife, Gwen, the "tiger," passionately concerned for the world's suffering, shows signs of neurosis. The action revolves round her wish to sign a petition for unconditional nuclear disarmament and Dean eventually, to save her from mental breakdown, bravely identifies himself with her and the cause, thereby deserting his philosophy and his career.

In its outcome the play stresses the value of social idealism, stifled as it may be by philosophic detachment and the pressures of conformity. It is typical of Bolt's dialectic that this value should be upheld by the disturbed Gwen and by Louis, an oddly irresponsible young man.

In this play Bolt departs from the realistic style by trying to make his characters larger than life in being unusually articulate about what they stand for.

A Man for All Seasons. 1960. P.

Here Bolt attempts to give his characters heroic dimensions by striking back into history.

Believing that our need today is a sense of personal individuality or "selfhood," he chooses as his hero of "selfhood" Sir Thomas More (Paul Scofield). More, described by one of his contemporaries as "a man for all seasons," was not only flexibly adjusted to Renaissance society, but also managed to preserve an inner core of unassailable integrity. Suspected of a critical attitude to Henry VIII's divorce, he used his skill in "the thickets of the law," yet resolutely refused to swear the oath to the Act of Succession that would have released him from the Tower and the block, because for him perjury meant the loss of the soul, the self. His constancy is thrown into relief by the growing corruption of Richard Rich, whose final perjury sends More to his death.

More challenges comparison with Brecht's Galileo. He also is a man of supreme intelligence, whose inner certitude of truth is persecuted by an absolute power. He also skilfully avoids open clash until he must eventually make a final choice between astute temporising and commitment of his life to his belief. The difference is that More opts unequivocally for constancy.

Bolt uses what he calls a "bastardized version" of Brecht's style. Episodic scenes are strung along a strong thread of intellectual argument. There is also a commentator in the form of the Common Man, who with the aid of property box takes a swift succession of minor parts, changes of role which throw into relief the steadfast individuality of More.

Bolt, like Brecht, believing that beauty of language is a means of "alienation," matches fine passages from More himself with his own appropriate use of wit and imagery, using images of land to suggest society and its laws and those of water and sea the superhuman context.

The film version, with Scofield, has been highly praised.

Gentle Jack. 1963.

Bolt depicts the conflict between the natural spontaneity of nature, represented by the magic figure of folk-lore, Jack-of-the-Green, in his forest, (Kenneth Williams) and the inhibitions of society in the person of Miss Lazara, financier and plutocrat (Edith Evans). Since Bolt believes that the modern doctrine of the return to nature may lead to violence, Jack finally contrives two murders. The play was not successful. Bolt in dealing with this age-old conflict could not, like Euripides in *The Bacchae*, draw on a familiar and deeply felt myth, and his allegorical plot proved puzzling, while the setting was too reminiscent of *Dear Brutus*. The play is too cerebral, the characters are more blue-prints than flesh and blood.

The Thwarting of Baron Bolligrew. 1965.

A play for children over eight was much praised by the critics as inventive and entertaining.

Edward Bond (b. 1935).

Saved. 1965. M.

Saved, which did not pass the censor, was first presented to the English State Society.

As a result of casual sexual intercourse with the promiscuous Pam, Len gets involved with her morose South London family, with Fred, the putative father of her baby, and with Fred's lewd gang, which murders the baby on the stage.

Since the play is largely in delinquents' argot, and is limited to a photographic study of inarticulate people, it is in itself somewhat inarticulate, but it constitutes a frank and compassionate social document.

Bertold Brecht (1898–1956).

Perhaps the most original and vigorous dramatist and producer of the century, the Bavarian Brecht was remarkable in his command of both literary and theatrical genius.

His practice and theory underwent constant modification. Early plays, like *Baal*, written to provide entertainment, reveal a satiric and anarchic attitude, and in 1928 the ironic *The Threepenny Opera* (P), made him famous. From 1930 onward his work became explicitly communistic, marked by the rejection of the individual in favour of a social ideal. But although Brecht always remained "committed" to Marxist ideology, most of his later plays, written after his withdrawal from Nazi Germany, are less didactic than humanist in spirit and it is by these mature works that he is best known in Britain.

After 1949 Brecht consolidated the famous Berliner Ensemble in East Berlin, where he developed his influential techniques of production.

The most permanent feature of Brecht's mature drama are the Epic form and the *Verfremdung*, or "alienation" effect, both developed in reaction to the traditional dramatic form, which he dubbed "Aristotelian." He considered that the closely constructed Aristotelian play, which encourages the audience's emotional participation in the action, syphons off the spectator's emotion, leaving him a passive and acquiescent member of society.

According to Brecht, the drama should be not ritual but debate. The spectator should be a detached observer, calmly investigating the view of the world that confronts him, rationally considering arguments and stimulated to decisive social action. It is taken for granted that he will find the solution to problems in communism.

Brecht therefore developed his "Epic," or narrative play, loosely constructed with a sequence of individual scenes, functioning as independent dramatic illustrations or quotations to the narrative.

He uses a variety of techniques to establish the narrative tone, such as an actual story-teller on the stage, explanatory verses relayed before the scenes, and banner headlines which foretell the events to be portrayed. Although by throwing the action thus into the past tense, he discards the lure of suspense, his dramatic intelligence, vigour, and inventiveness excite lively interest and curiosity.

To break down the traditional identification of the spectator with the action, Brecht developed his celebrated "alienation" effect, devising techniques to keep him at a critical distance. This implies using an image that suddenly makes the familiar appear strange and novel to the onlooker, so that he is shocked into recognising its significance.

His productions were thus avowedly non-realistic and theatrical, sometimes appearing like an inspired charade. He used not only direct narration but direct address to the audience, formalised settings and properties, masks and stylised make-up, sometimes grotesque in character. His text, "scarcely more than a prompter's copy," was freely adapted during rehearsal, so that an acquaintance with the pattern of Brecht's mime and gesture is often necessary to the full understanding of his plays.

Few find in Brecht's mature work the plea for communism that he intended, and many of his protagonists, designed as exponents of capitalist villainy, appeal strongly to the sympathy. The compelling and fascinating central ambiguity can be ascribed, as Esslin has pointed out, to the tension between Brecht's conscious reason and the unconscious emotional experience on which every creative writer must intuitively draw. This profound tension is the major source of Brecht's power.

Brecht's influence has been pervasive, especially on the dramatists Arden, Bolt, Whiting, and Shaffer, and on the producer Joan Littlewood. Above all his iconoclastic attitude and his fertile experiment have been invaluable in encouraging a new and empirical approach to drama.

Baal. Written 1918.

The amoral vagabond poet, Baal (O'Toole), driven by instinct and emotion, expresses the subjective experience of the youthful Brecht.

Galileo. Written 1938–9. M.

Brecht intended Galileo's recantation as an image of the scientist's allowing the State to assume authority over science. It has also been interpreted as Galileo's cunning expedient, allowing him to continue research.

Mother Courage. Written 1939. M.

In his panorama of war's futility, Brecht designed Mother Courage—a camp follower in the Thirty Years' War—as an epitome of the haggling profiteer. But his intuitive understanding of this dynamic, maternal figure, bereaved eventually of all three children, has endowed her with an ambiguous fascination.

The Good Person of Szechwan. Written 1938–40. M.

Shen Te (Peggy Ashcroft), the benevolent prostitute, has to disguise herself as Shui Ta, the harsh task-master, in order to survive in an unjust commercial society.

Puntila. Written 1940–1.

The drunken generosity of the mean landowner, Puntila, designed by Brecht to highlight his harshness when sober, has however given him an attractive inconsistency. The chauffeur who rejects Puntila's daughter, is a Schweikian character.

The Caucasian Chalk Circle. Written 1944–5. M.

The prologue to this delightful fairy-tale constitutes an overt plea for communism rare in Brecht's later work. The rascally judge Adzak, who takes bribes from the rich and gives judgment in favour of the poor, is one of Brecht's typical contradictory characters.

Peter Brook. Director.

US (or ambiguously *U.S.*). 1966.

US is a collaboration between director, actors, designers, musicians, and writers. It is their attempt to confront the Vietnam war, though it cannot be fully understood or influenced, and likewise to involve the audience in encounter with the terrible fact.

Brook admits anti-American bias because of the giant disproportion between the adversaries and "our own close involvement with America."

The First Act is a violent theatrical assault on apathy. Brook re-employs techniques from Weiss's *Marat-Sade* and alternates utmost stillness, as in the initial mime of a Buddhist self-immolation, with loud music and noise. In the hideous uproar and confusion of a bombing raid at the climax a giant war-effigy from the proscenium crashes across the stage. Shattering assault is succeeded in Act Two by a penetration in depth, its centre being a dialogue between a white man about to burn himself alive and a girl whose cold, detached criticism gradually gives way to a bitter indictment of English parochial indifference. In an ambiguous poetic finale an actor silently releases butterflies, one of which he burns.

This daring and controversial use of theatre directly to involve the emotion of the audience in confrontation with contemporary political tragedy may mark a new departure.

David Campton (b. 1924).

Campton's brief "glimpses" or playlets use techniques of the Absurd, which he considers as

"a weapon against complacency," to expose the actual dangers that threaten society, especially the bomb. His most notable works are the collections of playlets, *The Lunatic View*, 1957, and *A View from the Brink*, 1961.

Albert Camus (1913–60).

It was the French existentialist philosopher and novelist, Camus, who first enunciated the concept of the Absurd, describing it as whatever in human experience is incompatible with man's desire for reason, justice, happiness, and purpose.

Like Sartre, Camus expressed his views through the traditional dramatic form, and the plays most familiar here were those written before he had moved on to a more humanistic philosophy.

Caligula. French publication 1945. P.

The Roman Emperor, Caligula, suddenly decides to act in accordance with the absurdity of the universe and by his violent and perverse crimes forces on the Senators his own recognition of the absurd meaninglessness of existence.

Cross Purposes. French publication 1945. P.

Man's futile desire for happiness is dramatised in the legend of the mother and daughter who murder for gain the visitor to their inn, only to discover they have killed the son of the house. They then commit suicide.

Giles Cooper (1918–66).

Everything in the Garden. 1962. P.

Cooper deftly uses sophisticated comedy for a sharp satire on the sacrifice of principle to money in an effeminate bourgeois society. Four bored middle-class wives become part-time employees in an exclusive brothel, while their complaisant husbands enjoy the tax-free profits. There is a sudden horrifying change of key when at a party a neighbour realises the position and the four men destroy this outsider in a kind of ritual murder. In Cooper's second version the play returns rather shakily to the comic vein. It is interesting to compare Pinter's *The Homecoming*.

Happy Family. 1966. P.

Cooper's last play, outwardly a light, witty comedy, is an incisive, assured satire on arrested development and snobish exclusiveness.

He pictures a completely introverted trio, the well-to-do Mark and his two sisters for whom nobody exists outside the family circle, and who employ their leisure with Meccano, Beatrix Potter, nursery jingles, and the fear of punishment exercised by the sadistic Mark.

When the elder sister introduces a fiancé, Gregory, he acts as a catalyst, for between him and the younger sister there is the first dawning of tenderness and love. But Gregory is also retarded, an only child who hankers for family life, and also a compulsive liar, a grocer posing as a solicitor. He is a "nobody" to Mark who soon contrives that he shall be ousted and the nursery prattle is resumed

The bizarre situation aptly satirises that obsession with the clutter of the past that stifles natural growth and a lack of cognisance of other people which is frighteningly inhumane.

It is illuminating to contrast Triana's use of the same family triangle.

Shelagh Delany (b. 1939).

It is now a decade since Shelagh Delaney, the Salford girl from a secondary modern school, attracted attention with *A Taste of Honey*, 1958 (M). It was followed in 1960 by *The Lion in Love* (M), her last play to be presented.

Although both plays were improved on and produced by Joan Littlewood, they are naturalistic and owed some of their popularity to their fresh and artless picture of the poorer workers and drifters. Verisimilitude in the portrayal of seedy localities was then more of a novelty. *A Taste of Honey* still has significance, both in its unconventional subject, the pregnancy of an unmarried adolescent expecting a black baby and her friendship with a homosexual lad, and also in the direct candour of its emotions. *The Lion in Love* although more mature in outlook is artistically unremarkable.

Nigel Dennis (b. 1912).

Dennis, also a novelist, is a hard-hitting satirist in the tradition of Voltaire and Shaw, and in a Shavian preface to his first two plays he wittily defines his favourite targets. One is the doctrine of Original Sin as preached by Saint Augustine, the other the assumptions of psychoanalysis. He argues that both of these undermine natural self-reliance, and tend to delegate power over the mind to a hierarchy, clerical or medical, which may threaten personal individuality. The Preface is a lively firework display, but Dennis' arguments are sometimes one-sided and negative, more striking than valid.

One of the few dramatists to write in a Shavian tradition, he shows considerable dramatic talent, especially in his vigorous first acts, with their strikingly novel situation and witty and intelligent dialogue. But in the middle of his plays satire gets the upper hand and discussion diverts interest from the characters and tends to hold up the action and to weaken the structure, as in some of the later plays of Shaw himself.

Cards of Identity. 1956.

The play was adapted from Dennis' own novel. The "Mallets," members of a club formed to give people a changed identity, inveigle local people to a country house, where by exploiting psychological techniques they induce them into accepting changed names, memories, and identities and then use them as servants. Only in face of their Bank Manager do the victims rediscover their original personalities.

Dennis uses the adroit situation to illustrate the thesis developed in his Preface. Arguing that the basis of personality is memory, Dennis infers that the psychologist can edit his patient's memories, inject his own viewpoint and so undermine and manipulate personality. This plausible thesis is not verified by any appeal to scientific evidence.

The Making of Moo. 1957.

Compton, a colonial civil servant, has weakened the native taboo on murder by unwittingly killing the river god. He decides to invent the new religion, of Moo (the name suggested by the lowing of cattle), complete with mythology, musical ritual, and ethical code. In this daring satire on revealed religion Dennis exposes similarities between pagan trust in the efficacy of ritual blood sacrifice and the Christian doctrine of Atonement for Original Sin. In his Preface he suggests that to conform to a religious sect is to belong to an Identity Club, which threatens the individuality of its members.

August for the People. 1961.

Opening with a satire on the admission of the public—at a fee—to private "stately homes", the play proceeds to an indictment of the tameness of the common man. It lacks the pungency and inventiveness of Dennis' early work.

Marguerite Duras (b. 1914).

The French novelist and script-writer of the film *Hiroshima Mon Amour*, has recently turned to drama. She has the sensitive novelist's flair for dialogue and for exploring the contradictions and the ebb and flow of feeling in intimate relationships, so that her naturalistic plays move subtly and quietly towards their climax, which is often the agony of parting as in the one-act play *La Musica* (1966. P.).

Days in the Trees. 1966.

Duras's first full-length play is virtually a trio whose theme is the love-hate relationship between mother and son. The now ageing woman had indulged her own emotion by spoiling him, conniving at his playing truant for "whole days in the trees," and thereby undermining both their lives. "I've never loved anybody else," he tells her on her final visit to Paris, but she can no longer hide from herself his callous egoism and misery, as now a gambler and pimp he lives contemptuously with the girl for whom he procures.

Peggy Ashcroft's performance as the mother was widely acclaimed as the finest of her career.

Friedrich Dürrenmatt (b. 1921).

The German-Swiss Dürrenmatt acknowledges the Greek dramatists, Shakespeare, and Swift as major influences. He describes his work as "theatre of paradox," revealing "precisely the paradoxical effects of strict logic." He is an unsparing critic of contemporary society, whose dangerous tendencies he exposes in striking and bizarre fictions, reminiscent of the later Shaw.

The Marriage of Mr. Mississippi. 1959.

An extravaganza poses the opposition between two principles carried to their logical and farcical extreme. One is a passion for the law of Moses, interpreted as retributive justice. The other is pure Marxism. The two characters embodying these principles, together with a Quixotic lover, are manipulated and destroyed by an unscrupulous politician.

The Visit.

An old multi-millionairess revisits her birthplace and offers the inhabitants £1,000,000 to murder her former lover, who had denied her paternity order. Gradually persuading themselves that they are acting justly they comply.

Dürrenmatt cleverly maintains suspense in his withering satire on love of money, hypocrisy, and the sycophancy of press and radio.

The Physicists. 1963.

Dürrenmatt has said that this arresting play is not so much about the hydrogen bomb as about society itself and the impossibility of escaping the consequences of one's thinking.

The central character, attempting to suppress scientific discoveries that may lead to the hydrogen bomb, retires to a private asylum pretending to be in contact with King Solomon. There he is first in danger of two spies, pretending to the delusion that they are Einstein and Newton, and eventually of the mad proprietress whose use of his discoveries will lead to the destruction of the human race.

The Meteor. 1966.

Another play of paradox has as hero a man who wishes to die but cannot.

Schwitter (Patrick Magee), famous dramatist and Nobel prizewinner, already proclaimed dead in hospital, returns to the garret of his youth to die. In vain. As the old egoist swaggers, drinks, makes love, one by one those who touch his orbit meet their death.

The symbolism is unclear. Is Schwitter the egoistic kind of artist who feeds on the lives of others? The most effective incident—his dialogue with an ancient tart—cynically suggests that his art also has been prostitution, for he too has supplied artificial emotion to meet public demand.

The chief weakness of the play is that the surprise wears thin. An original idea adequate to a one-act play has been inflated too far.

Charles Dyer.

Dyer's first success was *The Rattle of a Simple Man.*

The Staircase. 1966.

The frankest play concerning homosexuality to be publicly staged is a dialogue between the middle-aged Charles Dyer (Scofield) and Harry C. Leeds (Magee) during a wretched Sunday night in their poky barber's shop in Brixton, the cage they have co-habited for twenty years.

Charlie is sardonic, aggressive, cruel; Harry, "a messy talker" is softer, protective. Their endless squabbling in ribald argot, comic, and searing, vents their exacerbated irritation, but underneath is glimpsed the pain of social isolation, the mother fixation, the frustrated hankering for offspring, the fear of exposure.

Although all proper names are anagrams of Charles Dyer and the author suggests that everything may take place in Charles's mind, Peter Hall's production was firmly realistic.

T. S. Eliot (1888–1965).

In his attempt to revive poetic drama the distinguished poet, T. S. Eliot, was moved by deeply religious and social aims, modestly regarding his work as experimental, "that of the first generation only." The verse he evolved was of a flowing poetic rhythm, "close to contemporary speech" and based on natural stress. Normally he used a line with three stresses and varying length.

In his two plays of the 'thirties Eliot had adopted the ritualistic themes and patterns of Greek drama and had achieved a certain tragic intensity. But the *Cocktail Party* inaugurated a new style, the theme still being Christian redemption and the plot deriving from Greek drama, but the idiom, that of the fashionable comedy of manners. In spite of subtle organisation the liaison has been an uneasy one.

It is curious that the creator of Prufrock should seem unable fully to animate his dramatis personae. This is partly because their inspiration is literary, partly because they are used to illustrate Anglican doctrine and to convey a message. Nor do they belong to the impeccable background against which they are so carefully placed.

The wealth and subtlety of reference of these plays and the beauty of the language make them a delight to the reader, but they are less compelling on the stage.

The Cocktail Party. 1949. F.

This play has its origin in Euripides' tragicomedy *Alcestis*, the demi-god Hercules being replaced by Reilly, the psychiatrist, whose intervention breaks the back of the play, for it is not easy to sympathise with people who let their actions be so directed.

The Confidential Clerk. 1953.

Described as "high farce," this play derives from another tragi-comedy of Euripides, the *Ion*, whose theme of parents seeking their lost children reappears in Terence, Plautus, and Shakespeare.

The Elder Statesman. 1955.

Eliot here returns to a tragedy, the *Oedipus at Colonus* of Sophocles, but the youthful peccadilloes of Lord Claverton appear pallid compared with the patricide and incest of Sophocles' protagonist.

Jules Feiffer.

Feiffer, the New York strip-cartoonist of international fame, had a one-act play, *Crawling Arnold*, performed here in 1965.

Little Murders. 1967.

The blustering Newquist family of New York embody what Feiffer has called the "national paranoia" in face of "random violence," and when the daughter, Patsy, introduces her fiancé, Alfred, who is so strong that he never retaliates, they are incredulous. But Patsy is killed by some stray bullet, Alfred adopts the Newquist ethos, and the family is happily united sniping down harmless passers by.

The main theme is clear. "Man hates war but is fascinated by it. . . . Peace is a Sissy." The play began as a novel and that may account for the plethora of other stimulating ideas about politics, religious attitudes, and so on which are never fully integrated. It may also account for some highly polished satirical vignettes, most entertaining but self-contained and not entirely relevant.

Brian Friel.

Friel is an Irish short-story writer who has now written four plays.

Philadelphia, Here I Come! 1967.

On the eve of emigrating to America a Donegal boy is torn by memories of his dead mother and his lost sweetheart and is disturbed by farewell encounters and failure to communicate with his taciturn father. His inner conflict is exteriorised by the novel device of two actors playing the same part, one his public the other his private self, which gives occasion for moments of comedy and pathos. Apart from this the play is naturalistic, its shape little more than episodic, and is kept afloat by its Irish poetic eloquence and charm.

Launched at a Dublin Theatre Festival, it had a long run in America before reaching England.

Max Frisch (b. 1911).

Frisch, a German-Swiss who has been influenced by Shaw and Brecht, dramatises current issues in ingenious, apt, and witty parables that have a lucid economy of outline.

The Fire-Raisers. 1961. M.

A delightful Absurdist satire on bourgeois self-delusion and ineptitude shows Biedermann (Alfred Marks) persuading himself that he can cajole the incendiaries about to set fire to his house by inviting them to a good dinner. The situation is analogous to that of Benes of Czechoslovakia who included communists in his government, and to that of the Germans who connived at Hitler.

Andorra. 1964. M.

An incisive and moving satire on the vicious pervasiveness of antisemitism shows the Andorrans' betrayal of the lad Andri, reputedly a Jewish foundling, to the invading totalitarian state. Andri is in fact a Gentile and his assumption of Jewish traits is an example of identity imposed from without by society.

Christopher Fry (b. 1907).

Fry was widely acclaimed in the 'forties for bringing verse back to the stage. His delightful verse, which plays over the surface of his plays like lambent flame, has been compared by Allardyce Nicol to that of the youthful Shakespeare.

Fry has written highly original comedies and religious plays and his work is informed by an implicit spirit of affirmation and hope, conveyed with gaiety and insouciance. He has a gift for devising ingenious situations in terms of poetic fable and metaphor.

Venus Observed. 1950.

Hope Wallace commented on the "dancing, glancing felicity" of this unusual comedy, in which Olivier was protagonist.

A Sleep of Prisoners. 1951.

This original religious play was commissioned for performance in churches during the Festival of Britain.

The Dark is Light Enough. 1954.

An eccentric and saint-like old countess (Edith Evans) gives asylum to men from both sides in the Hungarian rising of 1848. The theme of non-intervention is presented with a lightness and elegance which completely save the play from didacticism.

Curtmantle. 1962.

A historical play concerning Becket and Henry II concentrates on the contradictory nature of Henry. Fry deliberately uses a plainer and rougher verse and some prose.

Athol Fugard (b. 1932).

After working in the Far East and Europe, Fugard now has his own Theatre Group in his home town, Port Elizabeth.

The Blood Knot. 1966.

Of two brothers belonging to the mixed race of "Cape Coloureds," one "tries for white." The dialogue between them, both comic and naïve, and fraught with intense love and hate, is a microcosm of the terrible strains imposed by racial segregation.

Jack Gelber.

Gelber is one of the few Americans to attempt plays of the Absurd.

The Connection.

Beckett's theme of waiting is presented through drug addicts waiting for their dope, to the improvisations of a jazz quartet, but the realistic ending is inconsistent with the Absurdist style.

Jean Genet (b. 1910).

The French Genet, abandoned as a child, has lived as social outcast and criminal and, while politically "uncommitted," has mirrored his bitter repudiation of society in plays of frightening impact.

His dramatis personae have been the rejected murderers (*Deathwatch* (F)), despised servants (*The Maids* (F)), prostitutes (*The Balcony* (F)), Negroes (*The Blacks*), and Algerian peasants (*The Screens*). These have realised their fantasies of sex, power, violence, and revenge only by compulsive ritual acts, so that sequences of arresting ceremonial, sometimes Absurdist, replace character study and coherent plot.

In his destructive scorn of contemporary society, his recourse to rituals of violence, and his incantatory language, Genet satisfies the requirements of Artaud's Theatre of Cruelty.

The Maids. 1956. F.

Two sisters, maids to a fine lady, continually take it in turn to enact the rôle of mistress and maid so that each can vent her envy and rancour on the mistress. When their plot to murder the mistress misfires, one of them herself drinks the poisoned cup of tea.

Their compulsive charade, designed originally for a cast of young men, mirrors the obsessive and self-destroying conflict of envious love and hate in the mind of the outsider.

Triana's *The Criminals* has a similar theme and technique.

The Balcony. 1957. F.

This censored play had its world première at the Arts Theatre Club. It opens in a brothel, where the frequenters enact their fantasies of power by dressing up as bishop, judge, or general, until after an abortive revolution they are called upon by the Court to impersonate these authorities in actuality. Eventually the defeated revolutionary leader visits the brothel to enact the part of Chief of Police, who is then satisfied that his image also has been established in popular regard. The film gives a softened version of the play.

Jean Giraudoux (1882–1944).

Two plays of the French dramatist, Giraudoux, who had stimulated the return of poetry to the stage, were produced here in the 'fifties. *Duel of Angels*, 1953, with Vivien Leigh, was a posthumous work. *Tiger at the Gates*, 1955 (M), with Michael Redgrave, was a translation by Fry of a fine play of 1934. Giraudoux here used the classical legend of Troy as a vehicle for a protest against the stupidity of war.

Willis Hall (b. 1929).

In 1958 Hall was one of the few playwrights giving a candid realistic picture of the under-privileged, as in his best play *The Long and the Short and the Tall* (P) about soldiers trapped in the Malay jungle in 1942. He later collaborated with Waterhouse in North country comedies such as *Celebration* and *Billy Liar*.

David Halliwell.

Little Malcolm and His Struggle Against the Eunuchs. 1965. F.

A deliciously funny send-up of the angry young man cult is located in a Huddersfield garrett. Here Malcolm, a beatnik ex-art student, compensates for his inadequacies—professional and sexual—by fantasies of Hitlerian power. He imposes on his three chums his farrago of "Dynamic Insurrection", which so distorts reality that they all finally beat up the nice girl who wants to help Malcolm.

The sources of disaffection and violence are scrutinised incisively but with sympathy.

Michael Hastings.

Hasting's *Don't Destroy Me* was produced when he was 18. *Yes and After* (P) appeared in 1957.

The Silence of Lee Harvey Oswald. 1966. P.

The play, an example of "living theatre," begins with a straightforward narrative of the assassination of Kennedy, illustrated by film sequences and stills.

From the President's Commission Hastings then reproduces verbatim passages from the interrogation of Oswald's widow, and mother. Briskly alternating with these are scenes giving an imaginative reconstruction of Oswald's relations with these two women, based on Oswald's diary and letters.

The constant alternation of fictional scenes with snippets of factual evidence disturbs concentration, and diffuses the sense of authenticity and authority achieved by the unvarnished *Oppenheimer* play.

Rolf Hochhuth.

The Representative. 1963. M.

Using some dramatis personae who represent historical personages, this play in verse exposes the failure of Pope Pius XII, Christ's "representative," to protest against the massacre of the Jews. Film sequences of the horrors of Auschwitz are used with harrowing effect.

N. C. Hunter (b. 1908).

With a feeling for atmosphere, Hunter portrays disappointed people, ruefully accepting their limited environment, but his plays lack passion, intellectual pressure, and novelty.

His West End successes have been *Waters of the Moon*, 1951, *A Day by the Sea*, *A Touch of the Sun* and *The Tulip Tree*, all produced with star actors.

Donald Howarth.

A Lilly in Little India. 1965. P.

In the manner of Dylan Thomas's *Under Milk Wood*, two households are revealed simultaneously. A fatherless boy, nagged by his mother, finds some self-confidence by growing a lily bulb. This brings him into touch with a motherless girl and their hesitant friendship is indicated with some distinction and charm.

Eugene Ionesco (b. 1912).

Ionesco, one of the leading Parisian playwrights of the Absurd, differs from Camus and Sartre in that he expresses his conviction of life's absurdity, not rationally, but through images that are in themselves absurd.

In 1948, while learning English from a primer, Ionesco stumbled on his vocation, his shocked reaction to the platitudes he was memorising being dramatised in *The Bald Prima Donna*. Here he singled out aspects of contemporary life which remain as the chief targets of his ridicule.

One is the empty, myopic existence of the petit bourgeois, his lack of passion and thought, the yielding to conventional pressures, the urge to conform. Another is the desiccation of language which, stereotyped and inadequate, has become "nothing but clichés, empty formulas and slogans."

Ionesco's sense of life's absurdity has deep roots, for he is keenly aware of the anguish of the modern world, of the flight from reason, both tragic and absurd in its potentialities. He believes that by dramatising his own inner hurt he can best reveal a universal experience. In *The Shepherd's Chameleon* he has plainly stated that for him "the theatre is the projection on to the stage of the dark world within," the world of dream, anguish, dark desires, inner contradictions, and obsessions.

It follows naturally that he is little preoccupied with specific social problems. Regarding the human condition as wider and deeper than the social condition, he dislikes any kind of political message or conformism and deliberately repudiates the "committed" and didactic play.

Iconoclastic in both his principles and technique, Ionesco—as he indicated in *Victims of Duty*—has challenged most dramatic assumptions, including realism, the concept of the "Aristotelian play," consistent characterisation, motivation, plot, and the distinction between tragedy and comedy.

Discarding so much, Ionesco has evolved a new technique of shock tactic, using most ingenious theatrical devices to express his convictions. He attempts "to go right down to the very basis of the grotesque, the realm of caricature . . . to push everything to paroxysm, to the point where the sources of the tragic lie. To create a theatre of violence—violently comic, violently tragic."

In his plays, as in those of Pinter, the traditional dividing lines between tragedy and comedy melt away, for his amusing images are at the same time poignant, expressing as they do human disappointment and folly, so that his hilarious comedy may have a tragic import.

A characteristic technique is the use of proliferating material objects, which externalise the anxieties of his characters—an accumulation of chairs or eggs, for instance, or an expanding corpse. He hopes thus "to make the stage settings speak; to translate action into visual terms; to project visible images of fear, regret, remorse, alienation."

The discarding of proved theatrical techniques is risky. Shock tactics are successful only as long as they surprise by their novelty. It is a measure of Ionesco's talent that he continues to invent the novel and arresting.

In two of his most recent plays, *Rhinoceros* and *Exit the King*, the nihilism for which Ionesco has been criticised has been relieved by the assertion of the human value of fortitude.

Ionesco's plays were introduced into England in the 'fifties and they have had a marked and specific impact on English drama, especially on Simpson and Saunders. Although Pinter has a philosophy and style all his own, his work is based on similar presuppositions.

The Bald Prima Donna. Written 1948.

Characters from an English language manual come to life and pour out their clichés in a "parody of a play," which Ionesco first considered to be a "tragedy of language," but which proved theatrically very funny. The first dialogue between husband and wife is now a classic.

Thus Ionesco, almost by accident, wrote the first of many satirical exposures of the sterile language of those who live a merely mechanical existence.

The Lesson. Written 1950. P.

A nervous old professor coaches an eager young girl. Elaborately "proving" the impossibility of communicating by words, he arbitrarily decides what various words shall mean, until he rapidly gains assurance and eventually rapes and murders his pupil, the fortieth that day.

Ionesco illustrates the prostitution of language as a means to power, the sexual element in power, and the sadism lurking in the teacher–pupil relationship and indeed in all authority.

Jack. Written 1950.

Urged by his conventional family to settle down to married life, the Bohemian son, Jack, resists Roberte, the proposed bride, because having only two noses she is not ugly enough. He eventually succumbs to Roberte II with three noses. Ionesco parodies submission to bourgeois conformity.

The Chairs. Written 1951. P.

An ancient concierge and his wife prepare for a crowd of guests who are to hear his final message to posterity. As the totally invisible guests arrive the couple fetch more and more chairs for them, until, with the entry of the professional orator who is to pronounce the message, they jump into the sea. But the orator is deaf and dumb and his writing on the blackboard is a meaningless jumble.

The empty chairs constitute a most effective theatrical image for man's failure to communicate, and the dumb orator makes the record of a lifetime seem utterly futile. It may also suggest how meaningless can be the words of author and actor. Ionesco says, "The theme of the play is nothingness made concrete."

Victims of Duty. Written 1952.

By transforming a detective into a psychoanalyst, Ionesco argues that there is little difference between the psychological drama and the mere detective play.

Amédée. Written 1953. P.

A corpse in the flat of a married couple, constantly growing at a frightening rate, is a gruesome and appropriate image of their dead love.

Rhinoceros. Written 1958. P.

More and more rhinoceroses appear in a small provincial town. They are the inhabitants who, one after the other, want to be turned into these thick-skinned, aggressive animals. Finally only Bérenger (Olivier) resists the urge to conform.

The terrifying lure of conformity is here skilfully and movingly illustrated.

Exit the King. Written 1963.

In an agnostic counterpart of the 15th-century *Everyman*, Ionesco shows King Bérenger (Alec Guinness), in his disintegrating palace, reluctantly submitting to the process of dying, his final resource being fortitude alone. This dramatic elegy, inspired by the final scenes of Richard II, is designed with bold simplicity, presenting man's mortal dissolution with unflinching honesty and a tenderness new in Ionesco.

Alfred Jarry (1873–1907).

Ubu Roi. 1966.

In 1896, Jarry, initiator of the "Pataphysics" movement, scandalised Paris with his startling *Ubu Roi*, precursor of Absurd drama.

The characters appear as grotesque puppets, shocking and comic. The shameless, greedy Ubu caricatures both Macbeth and bourgeois vulgarity and in his brutal conquest of Poland becomes a monstrous prototype of ruthless cruelty.

Ann Jellicoe (b. 1928).

Ann Jellicoe's initial work as producer has left its mark on her plays. In an interview given soon after her unusual play, *The Sport of My Mad Mother*, she expounded her aims.

Discounting the concept of man as a rational creature and stressing that people are driven by their emotions, fears, and insecurities, she concentrated in her early plays on people in a highly emotional and irrational condition. What is more unusual, she deliberately tried to stir up in the audience the very emotions that were being portrayed on the stage. To do this she employed violent sensory and emotional stimuli—a barrage of visual action, rhythm, sound and sheer noise. Words were reduced to a minimum and these few frequently incantatory and devoid of meaning. Ann Jellicoe wanted the audience to yield unthinkingly to the emotional impact and to refrain from asking "What does this mean?" Needless to say literary values were being sacrificed to theatrical.

While these plays were often intense and exciting, they were severely limited in range and manner and to some degree obscurantist. The emotional is only one aspect of human experience, and it is inextricably entangled with intellectual experience which is just as valid. To dwell almost exclusively on the irrational to the neglect of coherent speech—man's hard-won tool of thought—is partial and misleading.

The function of the artistic image is so to reveal aspects of experience that they can be recognised and harmonised, and to elucidate the significance of the image intelligence is necessary.

It is interesting that in her latest play, *Shelley*, Ann Jellicoe appears to have discarded her theories.

The Sport of My Mad Mother. 1957. F.

A gang of teddy boys, living in terror of another gang which never appears, is dominated by the fierce and enigmatic Greta. Exulting in their feelings of violence, they express themselves in inarticulate and disjointed words and phrases, staccato cries and incantatory songs. Flim, a commentator, emphasises these with a set of instruments, including a motor-horn, which make sounds that are often discordant and arhythmic.

All this makes a receptive audience aware of what it may feel like to belong to an adolescent gang, but Greta is not easy to accept. A mother-schoolmistress figure, she finally gives birth to a child and is evidently an embodiment of the Indian goddess, Kali. The epigraph of the play is "All creation is the sport of my Mad Mother, Kali." In 1964 Ann Jellicoe explained that the play is based on myth and uses ritual, bodying forth "fear and rage at being rejected from the womb or tribe." Such symbolism demanding an interpretation of its significance is out of key with a play so deliberately "anti-intellect" and restricted to a direct emotional impact.

The Knack. 1961.

The knack in question is that of getting girls and three out of the four characters are frankly exposed in the irrational grip of sex. The inhibited Colin struggles with the over-experienced Tolen for the possession of Nancy (Rita Tushingham) and again the action is carried forward as much by improvisation as by coherent speech. The film version, which in 1965 won the Grand Prize at Cannes, captures the spirit of the play.

Shelley. 1965.

A lucid, well-documented chronicle play illustrates incidents in Shelley's life. Unfortunately the simple straight-line structure is not suited to the complexity of poetic genius. One would not guess that this is the Shelley capable of writing *Prometheus Unbound*. The personality that emerges is that of the selfless social idealist and pamphleteer and the theme his theory of free love, involving two women—Harriet and Mary—in disaster. The predicament is viewed more from the women's angle and the initial germinal situation, that with Harriet, who is presented as innocently pathetic, is so over-simplified as to be false.

The frequent change of brief scenes, effective in themselves, has a fragmented effect.

Erroll John. A West Indian playwright.

Moon on a Rainbow Shawl.

A play that won first prize in *The Observer* competition of 1956 depicts life among the poor in the Caribbean islands.

Heiner Kipphardt.

In the Matter of J. Robert Oppenheimer. 1966. M.

The play, already performed in 23 capitals, concerns Oppenheimer, "father of the A bomb." The source is documentary, the 3,000 pages of proceedings before the Personnel Security Board of the US Atomic Energy Commission in 1954.

A hearing taking over a month with 40 witnesses has been condensed and shaped so that evidence is represented by only 6 witnesses. Kipphardt's aim was to follow Hegel in stripping away the adventitious circumstances so that the essential situation clearly emerges. He has made a few additions, such as monologues and final statements, and all deviations from the literal documents are based on historical data.

The play therefore has an extraordinary authenticity and grip while the central dilemmas are lucidly presented. As *The New Scientist* points out, it is for the audience to answer the searching questions raised. Was Oppenheimer, with his communist connections, a security risk? Can a scientist work with state authorities and keep his integrity? Is he responsible for the use made of his discoveries?

Arthur L. Kopit.

Oh Dad, Poor Dad. 1961. M

Described by its young American author as a "tragifarce," this play won a prize at Harvard in 1960. Madame Rosepettle, a wealthy widow, is a parody of the devouring American "Mom," who emasculates husband, suitor, and son. She travels about accompanied by her husband's dead body in a coffin and her son Jonathan, aged seventeen, whom she treats as a child of ten. When in a final wildly comic and gruesome scene a young girl offers Jonathan love, the father's body falls across the bed and he is so terrified that he strangles her. The story is a frightening Freudian phantasy, the treatment deft and farcical, but there is little latent content.

Bernard Kops (b. 1928).

Kops, who was born in Stepney, of Jewish working folk, left school at the age of thirteen.

His plays include *The Hamlet of Stepney Green*, 1958 (P), *Good-bye World*, 1959, *Change for the Angel*, 1960, *The Dream of Peter Mann*, 1960 (P),

the one-act, *Stray Cats and Empty Bottles*, and *Enter Solly Gold*, 1962, chosen for performance in the provinces by Centre 42.

Kops is less successful with realism than with fantasy, enlivened with the gaiety of local colour and frequent Jewish folk-song.

Most of his plays are variations on a basic design—that of the idealistic dreamer-hero, with an uneasy relationship with his easy-going mother, who in some cases is courted by a suitor whom he dislikes. Eventually the hero realises that a devoted girl is his true mate. Kops' plays thus draw nourishment from a deep emotional source, that of the Oedipus-Hamlet myth, on to which he grafts the happy ending of the fairy tale.

Social criticism, especially of mass-produced goods is often a secondary theme.

The attraction of the plays is their fairy-tale charm and naïveté, their uninhibited joyousness and the easy way in which the rhythm of dialogue flows into verse, song, and dance. Kops is like a Jewish J. M. Barrie, with the significant difference that most of his heroes renounce their dream for reality.

The artistic tension between spontaneity of feeling and excellence of form has become so relaxed that dramatic intensity is often sacrificed. The plays are loosely constructed, and the dialogue sometimes so naturalistic as to be banal.

Ray Lawler. An Australian playwright.

The Summer of the Seventeenth Doll.

A vigorous realistic play was directed by John Sumner both in Melbourne, 1955, and in London. The seventeenth annual "lay-off" of two cane-cutters with their girl friends in Melbourne proves a tawdry fiasco. The more local theme—the awakening from the "Australianist" dream of the virile outback hero—carries with it the universal implication of the pain of disenchantment.

The Piccadilly Bushman. 1955.

This play proved disappointing.

D. H. Lawrence (1885–1930). *See also* **M5.**

It is remarkable that the plays of Lawrence should have had to wait half a century before coming to the stage.

In 1965, at the Royal Court, Peter Gill directed Lawrence's first play, *A Collier's Friday Night*, written in 1906. He followed it in 1967 with *The Daughter-in-Law* and in 1968 he re-staged these two, together with *The Widowing of Mrs. Holroyd*, in a special Lawrence season acclaimed by the critics.

These plays, written before the First World War, depict Lawrence's Nottinghamshire mining community with faithful realism. The themes are the universals already familiar through the contemporary *Sons and Lovers*—sex antagonism, the wife who feels "superior" to her miner husband, her possessiveness of the gifted son and jealousy of his wife or sweetheart.

Events of hearth and home, with profound emotional implications, move forward with a leisurely naturalism that is undisturbed by a forced plot and that seems extraordinary modern in its idiom.

Henry Livings (b. 1929).

The protagonist of Livings' frank and realistic comedies of working life is normally the little man, whose unforseen reactions culminate in hilarious disaster which topples down the petty rulers. Farce and near fantasy are lightly used to suggest a plea for the disregarded people who support the social edifice.

Stop It, Whoever You Are. 1960. P.

The insignificant Perkin Warbeck, a lavatory attendant in a factory, is involved in a series of ludicrous mishaps, but indirectly gets his own back on his harsh and frigid wife and his mean, pompous landlord. The comedy, which is very funny indeed, culminates in a fantasy-like scene of Warbeck's death, a séance, and a gas explosion.

Big Soft Nellie or the Sacred Nit.

A farcical comedy has as protagonist a mother's boy who is the laughing stock of his mates.

Nil Carborundum. 1962. P.

The scene is the kitchen of an R.A.F. station and the action culminates in a riotously-funny mock commando raid, which exposes both the pilfering cook and service routines that are now an anachronism.

Eh? 1964. M.

In an ultra-modern factory the incompetent young boiler-man, Val (David Warner), need attend to the boiler for only a few minutes during the 24 hours. Since he brings his bride to sleep in the bottom bunk and gives most of his attention to growing giant mushrooms, he neglects his duties and blows the place to smithereens. Again a light-hearted farcical comedy shows the underdog confounding established authority. A further significance is a fool's lapse starting the "mushroom cloud."

Robert Lowell (b. 1917).

The first dramatic work of the distinguished American poet, Robert Lowell, is *The Old Glory*, a recent trilogy of plays in free verse based on stories of Hawthorne and Melville. Their unifying motif is the flag.

Benito Cereno. 1967.

The third and best play of Lowell's trilogy is based on a short story by Herman Melville, which had its origin in actual incident.

About the year 1800, while off Trinidad, Delano, Captain of an American trader, observes that a Spanish trader, the *San Domingo*, is in great difficulties and generously goes to her aid.

Captained ostensibly by Benito Cereno, the *San Domingo* is in fact in the hands of her cargo of revolted slaves who have spared his life only that he may navigate them back to Africa. The effete and exhausted Cereno lives at the knife point at the hands of Babu, the wily and insinuating Negro who is in actual command.

Delano fails to realise this, for Cereno dare not speak plainly, and the American is too opaque and self-assured to interpret ironic hints. Only when Babu openly defies him is he enlightened, but too late. The only safe course now left to him is open violence and without warning his seamen massacre all the Negroes.

In a final ominous incident the last survivor, Babu, cries out "The future is with us" before Delano empties his pistol into the Negro's body, crying, "This is your future."

This is one of the most truly poetic plays to be seen in London for many years, lucid in verse, rich in themes and suggestive power, austere in design, while the theatrical poetry of mimes, rituals, and masques is used with ironic significance. The Director, Jonathan Miller, envisaged it as a kind of inverted *Tempest*, the Spanish ship a black magic island and Cereno a drugged Prospero held captive by Babu, and he produced it in the formal and stylised manner of opera.

The play is also remarkable in its relevance to America's dilemma, domestic and foreign, including her ambiguous attitude to the contemporary Negro. Jonathan Miller points out that Lowell here shows "the penalties of uninformed generosity" and of the trilogy as a whole he says, "These plays are about the big-hearted blindness of the American nation and they show quite clearly how the country's cardinal virtues can . . harden into the very vices which so disable the American pursuit."

In a world increasingly threatened by discord between white and coloured peoples *Benito Cereno* has an even wider implication.

John McGrath (b. 1935).

Of Irish extraction, McGrath, who had wide experience in the army before reading English at Oxford, has now had several plays published.

Events while Guarding the Bofors Gun. 1966. M.

In situation, McGrath's masculine and disciplined play is a realistic counterpart of Giles Cooper's radio fantasy *Mathry Beacon*.

The futility of military routine is exposed with steely irony as, on a freezing night in Germany,

during the Cold War, seven men guard the obsolete Bofors gun. The frustrating situation also engenders personal conflict. The uncontrollable desperado O'Rourke defies Lance Bombardier Evans. An insecure boy of 18, Evans is so obsessed by the hope that promotion may provide him a way of escape to England that he connives at insubordination. Finally O'Rourke's reckless suicide destroys them both.

Bakke's Night of Fame. 1968.

A play, faithfully based on the novel, *A Danish Gambit*, by William Butler, takes as subject the prisoner's last night in the condemned cell of an American prison.

Bakke, condemned for an apparently motiveless murder, enjoys being as provocative as possible, discomforting the well-meaning guard by first requesting then contemptuously rejecting the traditional routine of food and consolation. He entangles the priest with his contention that society is exercising not justice but revenge, his only constant demand being that he shall meet his "buddy," the executioner.

This granted, Bakke so needles and infuriates the executioner that the man is betrayed into a violent outburst, gloating over his imminent task. Bakke, gleeful and triumphant, has proved his point about revenge.

McGrath shows great ingenuity and expertise in manoeuvre and sudden surprise, but he has not quite achieved the tension and suspense nor the progression of the *Bofors Gun*. The significant encounter with the executioner comes too late and is treated too briefly.

David Mercer (b. 1928).

Mercer is author of the play *Ride a Cock Horse*, 1965, and the film-script, *Morgan*. He is concerned with the modern predicament of the able, educated young man of working-folk origin, a reflection of his own situation, and depicts him as estranged from his parents, disorientated, and childless.

Belcher's Luck. 1966.

The ricketty English class structure is the framework of a complex play.

On his ramshackle country estate, contemptuously served by his former batman, Belcher, Sir Gerald is becoming senile. Helen, his icy, avaricious niece, persuades Belcher to goad her uncle to his death so that they may together inherit the property. She then scornfully dismisses Belcher in favour of Victor, his bastard son.

Victor, expensively educated by Sir Gerald, is mentally unstable and impotent, but this familiar Mercer figure is now on the periphery. The conflict between the chaste and physically timid Sir Gerald and the coarse and drunken Belcher has become the compelling focus.

Arthur Miller (b. 1915).

Arthur Miller, an admirer of Ibsen, shares his strong sense of moral purpose and of the individual's responsibility to the community. This is balanced by a sympathetic understanding of the insecurity of the individual in modern society.

Miller's characters, deeply felt and realised, are fallible men who suffer through their own errors of character or judgment in social conditions which are incomprehensible, indifferent, or even hostile to them.

A recurrent pattern is that of paternal responsibility within a patriarchal family unit, and the father's distress as he sees his errors hurting wife and sons. But the sense of responsibility flows outwards to society as a whole, of which the family is but the growing point. Significantly—apart from the benign mother-figures—Miller's most balanced characters are lawyers.

His plays are well constructed, the dialogue economic and telling, and he has progressed from the realism of *All My Sons*, published 1947, to much freer experimental techniques, while the prose style has become more fluid and eloquent.

Death of a Salesman. Published 1949. P.

A compassionate and finely-balanced play exposes the impingement of hire-purchase commercialism on the ageing salesman, Willy Loman, a weak, foolish, and deeply affectionate man, and also reveals his overwhelming sense of guilt towards wife and sons. The play is worked out on two planes, the inexorable present and Willy's past which obsessively enacts itself within his mind. The film version with Frederick March, is excellent.

The Crucible. Published 1953.

In 1949 Marion Starkey's *The Devil in Massachusetts* dealt with a witch-hunt in Salem in 1692, and pointed out its relevance to our own age, also rent by "ideological intensities." In 1952 the activities of McCarthy gave it a special urgency.

In his powerful play Miller uses this historical incident to depict not an indifferent society but one in which positive evil is unleashed. The evils he explores are the persecution of a minority and the interference of the Establishment in the individual conscience.

Characteristically Miller focuses attention on the plain man, John Proctor, and he invents his former adultery with Abigail, so that the play is not a partisan manifesto but a study of the complex contradictions of actual life. The self-righteous fanaticism of the persecutors and Proctor's own growth in self-knowledge and courage are faithfully and poignantly portrayed.

A View From the Bridge. 1956. P.

Eddie Carbone, a Brooklyn docker, is so gripped by jealous possessiveness of his wife's niece, that he eventually betrays her two kinsmen, illegal immigrants, to the Authorities.

In a play of repressed sexual passion, with hints of incest and homosexuality, Miller shows mastery of a kind of situation new to him and the heightening tension is realised in taut and disciplined sequences.

A lawyer, Alfieri, acts as a Greek chorus but is powerless to intervene, for Eddie infringes something more primitive than the legal code and it is by the primitive vendetta that he is eventually killed.

Incident at Vichy. 1966. P.

Miller here turns to the responsibility of society for the individual in a play which exposes the latent racial hostility which even the best men may unconsciously harbour.

The example he takes is antisemitism, the place and time Vichy in 1942, the scene a bleak anteroom within sound of a railway, where sealed trucks are deporting Jews to the furnaces of Auschwitz. Here a group of men and a boy, Jewish suspects, await investigation. There is an atmosphere of chill horror and suspense as each tries to summon up his own pitiful defence against the premonition of the ghastly journey he must embark on, once he is summoned behind the closed door.

Eventually only two men remain, the two most aware and articulate, Doctor Leduc, a Jewish analyst (Anthony Quayle) and Von Berg (Alec Guinness), the only Gentile of the group, a cultured and humane Viennese Prince, who is horrified by the vulgarity and barbarism of the Nazis.

In their final dialogue Doctor Leduc convinces the Prince of his unconscious antisemitism and the Prince gives his safe-conduct to the doctor.

A subsidiary theme of the play is the way society imposes extrinsically an identity on the individual, in this instance, as in Frisch's *Andorra*, the rôle of victim on the Jewish people. Through Leduc, Miller also criticises the Jews' acceptance of their rôle.

This disturbing play makes the greatest demands on the emotions, intelligence and humanity of the audience, who like the Prince to some degree undergo psycho-analysis. But the play is also characterised by a fine restraint. As in Æschylus' *Agamemnon* the violence takes place behind closed doors, with the significant difference that in Miller's play the chorus and victims are identical.

Roger Milner.

How's The World Treating You? 1965.

A comedy in the nonsensical-satirical vein of Henry Livings does not maintain the conviction of its lively and amusing first Act.

John Mortimer (b. 1923).

Mortimer, a barrister, first won success with his short plays, such as *The Dock Brief*, 1957, and *Lunch Hour*, 1960 (M)., originally written for radio and television.

Here his talents are seen at their best, especially his gift for seizing on an unusual encounter between "the lonely, the neglected, the unsuccessful," whom he envisages in realistic settings of shabby gentility, and he is particularly sympathetic to those who allow their fantasy to overlap or swamp actuality.

But the moment of insight that gives pathos to his short plays is not enough to illuminate those of full length, like *What Shall We Tell Caroline?* and *The Wrong Side of the Park*, which lack substance.

Two Stars for Comfort (1960, M.) is also unsatisfactory. In its basic situation it is an inflated version of *Collect Your Hand Baggage* (M), with little beyond sentiment and pseudo Laurentian special pleading to fill the gaps.

The Judge. 1967. M.

After 40 years' absence from his native city, the bachelor Mr. Justice Chard returns for his last assize, but his conduct is disturbing, for he seems to expect some unspecified accusation. Suspicion centres on Serena's Bohemian establishment, but when the judge finally confronts Serena there he demands condemnation of himself.

It is revealed that as a youth he had on one occasion had relations with her knowing her to be a minor, and had subsequently paid for an abortion and that his whole life had been slowly undermined by a rankling sense of crime and inconsistency. When Serena tells him that there was no occasion for an abortion and that she got the money from him to go abroad with her lover, the bewildered and frustrated Chard goes berserk.

The plot is thus an inversion of Dürrenmatt's *The Trial*. The commanding themes of guilt and the difficult and exhausting process of judging are boldly focused in the compulsive personality of Chard, many-sided and realised in depth. Balancing the themes of guilt and retribution is that of permissiveness, represented by Serena. She is unfortunately pictured in a superficial way as a shallow Bohemian, and her ménage is not unlike that satirised by Mrozek in *Tango*. Although she has some charm, she is too patently silly and childish to command respect and much of the potential tension of the play is therefore slackened and relaxed. Is the author too indulgent to his off-beat characters?

In the scenes with the judge Mortimer returns to the milieu of *The Dock Brief* and much of the attraction of the play is in his wry attitude, fascinated, tolerant, and amused, to the ceremonies and quiddities of the legal process.

Slawomir Mrozek (b. 1930).

Mrozek, a Pole, who began as journalist and cartoonist, has recently extablished a reputation for satirical short stories and short plays.

Tango. 1966.

Mrozek's first full-length play is like a satirical cartoon, an expressionistic exposure of the cultural and political vicissitudes of 20th-century Europe as liberalism, fascism, and communism succeed one another.

A slovenly household of ageing Bohemians sentimentally cherish their memories of youthful rebellion against social convention when just to dance the tango was an act of defiance.

The son, Arthur, detesting their sloppy anarchy of taste and morals, enlists his reactionary great-uncle Eugene in his own counter-revolution to restore the *status quo*. But he soon resorts to fascist rant and force, terrorising the family until he is himself cut down by his own henchman, the tough lout, Eddie. The curtain falls as Eddie forces Eugene to partner him in a tango.

To an English audience especially the flatness of characterisation incidental to the cartoon style may be a little unsatisfying, but the novel satire is exhilarating.

Peter Nichols.

Nichols is well known as a successful TV playwright.

A Day in the Death of Joe Egg. 1967. F.

Nichols has shown remarkable sensitivity and skill in developing his theme—the especial difficulties of monogamy when the only child, a ten-year-old girl, is a hopelessly retarded spastic. He uses comic techniques of revue as the parents re-enact their frustrating encounters with doctors and clergy. But below the jesting façade grows the realisation that the wife's compulsive maternity blinds her to her husband's needs and that his endurance is crumbling. The climax comes when after attempting to end the child's life by neglect he creeps away from home.

Nichols, who has a spastic child has said, "It's play about marriage. . . . It's not autobiographical."

Eugene O'Neill (1888–1953).

Although O'Neill's work belongs to the first half of the century, three of his later works had their delayed première here in the 'fifties, two of them making a great impression.

Recognised as the greatest and most influential of American playwrights, O'Neill at his best came to close grips with the serious issues of human life, showing man battling with a harsh environment and with his own inner passions. He was deeply involved with his characters, often the flotsam and jetsam of humanity, conceived with disillusioned compassion, and he could create the powerful theatrical situation which rivets the audience. On the stage these gifts went far to compensate for a looseness of structure and a dialogue which is singularly flat, poor in vocabulary, and lacking in rhythm. His plays are better acted than read.

O'Neill, lacking the advantage of an American dramatic tradition, experimented with many European techniques before finding his own most personal style—a faithful realism with suggestive overtones of emotion and reflection.

British playwrights like Wesker and Alun Owen resemble O'Neill. They also are committed to individuals, especially to working people living insecurely. Like him they reveal the subtle and inhibiting ties that bind members of a family or gang, subjects which lend themselves to a similar rather sprawling and diffuse structure and dialect style. So far they have not matched O'Neill's passionate and gripping intensity.

The Iceman Cometh. Published 1947.

In a naturalistic play, whose prototype is Gorky's *The Lower Depths*, down-and-outs await the arrival of the dionysiac Hickey. But Hickey has just murdered his wife and his abortive attempt to rouse them from "pipe dreams" to reality leaves them sunk even more deeply than before in drink and self-deceit. The pessimistic theme is that of Ibsen's *The Wild Duck* and the situation that of Beckett's *Waiting for Godot*.

Long Day's Journey Into Night. Published 1955.

An avowed autobiographical play depicts O'Neill's family on the day when his mother (Gwen Francgon Davies) relapses into drug addiction and Eugene learns that he must leave the doomed circle for a sanatorium. As it was there that he chose his vocation, this constitutes the one note of hope in a deeply mournful reverie. The Freudian love–hate relationships are unfolded with tender understanding.

Joe Orton (1933–67).

Orton was a successful commercial playwright who also won praise from serious critics especially for his dialogue.

His range is narrow and he is preoccupied with crime, perverted sexuality, and violence portrayed without inhibition as hilariously comic, sometimes with satiric effect. The macabre plots give occasion for a flow of deadpan repartee, normally smutty, sometimes merely facetious, often very apt and funny indeed, always a parody of the would-be genteel. Nearly all Orton's characters speak alike and are as undifferentiated in their lingo as in their lack of morality.

The satire is in the form of caricature or parody and apart from its implications it is almost impossible to discover in Orton any expression of human value or aspiration. It is not always easy to discriminate between the unsavoury matter of his plays and the expertise and aplomb with which it is manipulated, and some feel that he defaces the image of life.

Entertaining Mr. Sloane. 1964. P.

The handsome young wastrel, Sloane, already a murderer, finds a cosy refuge with Kath. A slattern of forty, she smothers him with motherliness and, sexually insatiable, she seduces him from the first night. Her brother, Ed, a homosexual, soon employs Sloan as his "chauffeur." When Sloane tries to escape their possessiveness, his brutal murder of their father puts him into their power and they agree quite literally to share him, each having him for six months at a time.

The play scores by a skilfully handled plot, an ironic "poetic justice" and the sly and genteel euphemisms of the salacious dialogue, and it won the London Critics Variety Award as the best play of 1964.

Basically the plot is that of Pinter's *The Birthday Party*. In both cases a man on the run is sheltered by a slovenly older woman, but here Kath's sexuality vulgarises the situation and as she constantly refers to herself as Sloane's "mamma" and to their unborn child as his "brother" it is highly suggestive of incest. The kindly husband of Pinter's play has been replaced by the homosexual smart-Alec, Ed.

Loot. 1966. M.

Helped by his accomplice a young criminal secretes the loot from a burglary in his mother's coffin. This is the key situation in a macabre and complicated farce, which is also an exuberant caricature of funeral ritual, of a police which is represented as hamhanded and venal, and of cheap detective fiction. The characters are cardboard puppets manipulated by the plot and the play is notable for the fact that vice is completely triumphant. It won the *Evening Standard Award* for the best play of 1966.

Crimes of Passion. 1967. M.

A double bill consists of *The Ruffian on the Stair*, 1966, Orton's first play, and *The Erpingham Camp*, 1967. Frequent and fussy scene changes betray their origin in radio and television respectively.

The Ruffian on the Stair.

It is illuminating to see how Orton's first play, a grotesque and savage comedy, uses the plot but not the atmosphere of Pinter's first play, *The Room* (q.v.). Orton cuts any aura of mystery and makes all explicit. The occupants of the room are now Mike, a criminal living with an ex-prostitute, Joyce. The intruder is a boy ostensibly seeking revenge for his brother with whom he had lived in homosexual incest, and whom Mike had murdered. He is in fact seeking his own death and provokes Mike to murder him by pretending that he has seduced Joyce.

The Erpingham Camp.

A satire on holiday camps shows an uprising of the merrymakers who eventually kill Erpingham. The ebullient parody has some highly comic incidents.

It was first projected as a film script, a modern version of Euripides' *The Bacchae*, but was rejected by Lindsay Anderson. Euripides' great play with Freudian foresight shows Pentheus destroyed by revellers because he had repudiated the liberating worship of Dionysus. (*See* H123.) Orton's sketch completely lacks any such insight or complexity and Erpingham meets his fate simply because he is stupid and dictatorial.

John Osborne (b. 1929).

Osborne has considerable theatrical talent, torrential eloquence and the journalist's flair for seizing the mood of the moment.

All these gifts were evident in *Look Back in Anger* which was perfectly timed and its success immediate. The protagonist, Jimmy Porter, voiced the pent-up feelings of contemporary youth, especially of the classes newly educated, now baffled by the complacency of the privileged classes who had muddled through two wars and left them without sense of security or direction. The play's pervasive mood of self-pity and strident denunciation runs, with some variation, through much of Osborne's later work, although with the passing of years it seems increasingly subjective and irrelevant to the current situation.

In his major plays, *A Patriot for Me* excepted, Osborne keeps to the same basic pattern of characterisation and structure. In Jimmy Porter he created an unforgettable character, a myth. But Jimmy with some change of occupation and age is constantly reappearing, disaffected, disorganised by self-pity, articulate, and dominating. Archie Rice and Bill Maitland are older but they also are Narcissus figures driven on by sado-masochistic urges to destroy themselves and their circle. Osborne's minor characters are sketched in a perfunctory, rather stagey way, serving chiefly as audience or target to the protagonist, and there is little dramatic confrontation of equals.

Closely linked with the structure of the plays is the nature of the dialogue. Osborne's forte is rhetoric, the thinly disguised monologue, splendidly uninhibited, with some of the inebriation and excitement of the pub, and with the same coarse and bawdy jests. Sometimes it is a tirade of invective, sometimes shrill and hysterical, always commanding, always flowing exclusively from the protagonist. Minor characters are given little opportunity for repartee or discussion, their rôle being for the most part to act as "feed."

Osborne's plays appear to be satiric in intention but in comparison with the masterpieces of Ibsen and Shaw they express merely negative hostility against the "establishment" and are not based on any clear concept of the values that should be realised in a good society.

"There aren't any good, brave causes left." says Jimmy Porter. Neither here nor in any other play is there anything to suggest that Osborne does not endorse this destructive statement, one of the silliest of the century.

His invective is moreover too general, indiscriminate, and direct to be effective. His weapon is the bludgeon of sarcasm, seldom the rapier of irony. Some notable exceptions are to be found in *Luther* where the targets are limited and specific and the speech where Tetzel sells indulgences is finely ironic. In this play Osborne has learned from the intelligence of Luther and the process of history. He is in general too emotional and subjective a writer to excel in an art which demands disciplined thought and detachment.

The sameness in structure and tone in Osborne's work is cleverly mitigated by experiment in theatrical techniques. The realism of the garret scene in *Look Back in Anger* was in 1956 strikingly original. In *The Entertainer* and *Luther* he profited by the example of Brecht, and *Under Plain Cover* was influenced by Genet.

Look Back in Anger. 1956. F.

This play is concerned with misalliance in a garret. Jimmy Porter, aggressively working-class in allegiance, has married Alison, a colonel's daughter. The son of an indifferent mother, Jimmy has identified himself with his father and is now making a neurotic attack on his wife, bent on breaking her nerve by a relentless barrage of savage vituperation against her and her privileged family. When she goes home because she is pregnant, her friend Helena takes her place and somewhat improbably becomes Jimmy's mistress. Alison having lost her baby returns and only when Jimmy reduces her to grovelling before him do they resume their unstable contact.

The play was arresting in its shabby setting, at that time a novelty, and in its theme of social and sexual tension expressed in terms of furious diatribe, for it cleverly synthesises the attack on Alison with an attack on the privileged classes. Jimmy's marriage to her symbolises plunder and rape on these classes with all the excitement that rape arouses and her sensational replacement by Helena gives another fillip.

It is interesting to note that the pattern of personal and social relationship between Jimmy, Alison, and the Colonel echoes that of Jean, Julie, and the Count in Strindberg's *Miss Julie*.

The play's central weakness is in its portrayal

of character. The supporting characters are too compliant to be convincing but more disturbing is Osborne's ambivalent attitude to the neurosis of Jimmy. It is impossible to escape the feeling that Jimmy is not objectively presented and that this immature and wantonly destructive figure is to some degree the mouthpiece of the author.

The play is satirical in intention but not in effect, since Jimmy's anger is plainly the outcome of jealousy. It is rather a melodrama of words, shocking the complacent and preparing for the reception of new playwrights. The film version is recommended.

The World of Paul Slickey.

This comedy with music was a failure. It was an attempt at social satire, but in its indiscriminating attack on a multitude of targets failed to maintain any consistent standard of reference.

The Entertainer. 1957. F.

Osborne here attempts to use the Brechtian device of "endistancing," employing a framework of music-hall scenes, where Archie Rice (Olivier), a seedy comedian, tries to hold the stage with tawdry patter and songs in a dubious show with nudes called "Rock'n Roll New'd Look." These are intended to "endistance" realistic scenes of Archie's shabby home. But the "endistancing" device serves little purpose for the overall mood of unquestioned disillusion "whooped up" by drink and patter is in both planes unrelieved. Querulous complaint that England has lost the glory and glamour of Edwardian days is crystallised on the realistic plane by the report of the death of Archie's son at Suez and in the music-hall by the presentation of a nude Brittania, wearing only her helmet.

Osborne turns to the music-hall because he claims it to be a folk art, with a technique that "cuts across the restrictions of the so-called naturalistic stage," with an immediate, direct contact. The film version is good.

Luther. 1961. F.

Luther, based on a recent biography, is a less subjective work, although Osborne again takes for his hero a rebel, the son of an unsympathetic mother, and emphasises the emotional and not the intellectual sources of Luther's protests.

The play is imitative of Brecht's *Galileo* both in its loose "epic" structure and also in the attempt to present the protagonist in an equivocal light. The first two acts give a sympathetic and leisurely portrayal of Luther's early conflicts of conscience and vigorous attack on superstition while in the third act he is hurriedly presented as having treacherously let down the peasants who had been encouraged to rise against the Emperor. But the political reasons for Luther's dilemma are not even hinted at and we are invited not to think, as in *Galileo*, but to condemn while ignorant of relevant facts. Structurally this sudden *volte face* is most damaging to the play.

The most effective scenes, such as Tetzel's selling of indulgences and Martin's sermon at Wittenberg are splendid rhetoric, without a word of dialogue and directed straight at the audience.

Skilful period production and the acting of Albert Finney as Luther made the play theatrically effective.

Two Plays for England. 1962.

Two slight plays make a double bill.

The Blood of the Bambergs is a parody of a royal wedding. Monarchy is held up to ridicule along with its trappings of ceremonial and fulsome adulation by press and radio. The bridegroom having just been killed in his racing-car, an Australian press photographer is secretly passed off in his place. The final act is a film with an unctuous running commentary, the film device deriving from the German Expressionist theatre, where it was first used by Ernst Toller.

Under Plain Cover is intended as an attack on sensationalism in the press. The first part shows a pretty provincial couple dressing up in rôles symbolic of sex fantasy, their activities accompanied by a thin trickle of dialogue. In the second half dramatic presentation is abandoned in favour of a charade and commentary by a reporter who reveals that the couple were brother and sister, a feeble presentation of the compelling theme of incest. The first scene is a pallid imitation of the brothel scene in Genet's *The Balcony*, where the assuming of symbolic rôles has powerful sexual and political implications lacking in Osborne's play.

These sketches do not profess to offer convincing studies of character in action and unlike intelligent satire they do not imply positive standards nor use the mature techniques of irony and wit, but rely on parody and mimicry.

Inadmissible Evidence. 1964. F.

A play, which many have praised highly, has the ingredients of a commercial success. It provides the sensational spectacle of a middle-aged solicitor, Bill Maitland, obsessed with sex, and disintegrating under the influence of drink and drugs, and, thereby, such a rôle for the star actor (Nicol Williamson) as to constitute a stage *tour de force.*

The play opens with a dream sequence as Maitland is tried in the court of his own mind. What follows is his rancid outpouring of self-pity, as during forty-eight hours, he is progressively deserted by staff, clients, and mistress. Some of the minor characters are here reduced to unheard voices on the telephone and one actress serves to impersonate three faceless clients. Maitland's flagellation of himself and his circumstances is unrelieved and monotonous.

A Patriot for Me. 1965.

The protagonist of Osborne's best play, produced privately, is Redl, a distinguished army officer of the Austro-Hungarian Empire, who through his homosexuality is blackmailed into becoming a spy for Tsarist Russia.

Osborne is here finely objective and ironic. He uses a series of brief scenes with significant juxtaposition of characters and swift dialogue. The first act, showing Redl's gradual discovery of his nature, is extremely discriminating and adroit and the drag ball which opens Act Two is an astonishing *tour de force.*

Act Three shows a decline of tension as Redl, now a spy, himself declines, his fibre coarsened through a sequence of sordid infidelities by male lovers and prostitutes. His final unmasking and suicide is almost a foregone conclusion.

The play spans the years 1890–1913 and Osborne presents the ethos and atmosphere of the Imperial Army officer élite, undermined by espionage and treachery, in a vast and unforgettable panorama.

A Bond Honoured. 1966.

Osborne, in a free translation of *La Fianza Satisfecha*, is said to have distorted Lope de Vega's play and portrays yet another alienated, and narcissistic "hero."

Alexander Ostrovsky (1823–86).

The eminent Russian playwright is unfortunately little known in this country.

The Storm. 1966.

Written in 1859, Ostrovsky's fine realistic play portrays a social group unfamiliar to us, the petty tradesmen of an isolated township, who are avaricious, ignorant, and bigoted.

The widow, Kabanovna, is a warped and ruthless matriarch, who saps the vitality of her weak son and cruelly tyrannises over his hapless wife, Katerina. The lonely, susceptible girl yields to the love of a young stranger from Moscow. Then sheltering in a church during a violent storm, she is overcome by superstitious dread and remorse. She confesses and later kills herself.

This perceptive tragedy is that of young and sensitive people striving to escape the yoke of rigid elders, but in the last resort succumbing to the harsh creed by which they have been indoctrinated.

Alun Owen (b. 1926).

Of Welsh stock but with an Irish mother, Alun Owen spent his youth in Liverpool. Most of his writing has been for television.

His most characteristic style is the new naturalism used in a romantic nostalgic way to evoke the local colour of Liverpool. He seizes on the idiomatic dialects and the dramatic conflict implicit in the clash of race and religion between Welsh,

Ulster folk, and Irish, while the restless ambition of some of the younger generation to get away to sea or to London gives a wider horizon to a scene otherwise parochial.

Progress to the Park. 1959. P.

This, in Owen's favourite idiom, is a leisurely enquiry into the affinities and animosities of Liverpool working folk, especially of a group of four young men and a girl as they eddy about in street, pub, and park. The clash of race and religion is always just below the surface, and what thread of story there is concerns the crossing of young love by parental prejudice. The most lively character is Teifon, the voluble Welshman, originally a kind of commentator, and the mouthpiece of Owen's views.

The Rough and Ready Lot. 1959.

A carefully constructed historical play concerns four mercenary officers in a revolutionary army in South America just after the American Civil War. In a different milieu religious strife is again the theme. The convictions of an Irish Catholic clash violently with those of a Welsh militant atheist as to whether they shall shell a Catholic monastery which blocks the pass. Eventually both men are killed, together with the vacillating English colonel, and it is the "simple and ordinary" man, Kelly, who takes command, the conflict of belief still unresolved.

Harold Pinter (b. 1930).

Pinter, formerly an actor, is now considered as one of the leading playwrights of the "Theatre of the Absurd." He exerts an almost hypnotic power over his audience, for he has an assured theatrical expertise, an uncanny sense of the novel situation and the telling pause; and, as his plays find resolution in some final surprise, they are aesthetically satisfying.

His art has developed swiftly, and two main phases can now be distinguished. The early plays, culminating in *The Caretaker* in 1960, were concerned with the underprivileged and showed a growing sense of compassion and only a passing interest in sex. More recently Pinter has explored new ground. The plays have been much concerned with sexual experience; the background has usually been sophisticated; and the attitude detached, sometimes to the point of apparent indifference.

Whatever the subject, Pinter's plays have a certain poetic resonance, an imaginative absurdity. His power is probably due to his intuitive awareness of man's sub-conscious life and most of his plays present a dream-like sequence of events, half credible, half absurd. In the early plays the dream drifts into a familiar nightmare of the most primitive kind—that of the violent invasion of personal security—a fear that must have assailed man's stone-age ancestor as he lurked in the squalid shelter of his cave, terrified of wild beasts and the inexplicable catastrophes of nature. Many of Pinter's later plays are still dream-like, fantasies of sexual anxiety and gratification, especially as to marital fidelity.

The situation that first fascinated him was that of a room, a door, and two people. He has said, "Obviously they are scared of what is outside the room. Outside . . . there is a world bearing upon them which is frightening." The room is normally cosy but sordid, the people insecure, for Pinter is most interested in people when they are "at the extreme end of their living, where they are living pretty much alone." The danger that breaks in on them is both comic and shocking, but bizarre as the predicament may be, the play is anchored in actual experience. "I think it is impossible," he says, "—and certainly for me—to start writing a play from any kind of abstract idea. . . . I start writing a play from an image of a situation and a couple of characters involved and these people always remain for me quite real."

But his basic situation is so novel and striking that, like poetry, it can be interpreted on more than one level, both as a revelation of those periods of intense private anxiety when the individual, ill but distraught, holds on precariously to some tiny foothold, and also as an image of the predicament of the whole human race whose existence is threatened by ungovernable forces. Like Kafka, whom he admires, Pinter expresses vividly the feeling of inscrutable menace from some vague hinterland invading humdrum human existence. *The Birthday Party*, in particular, has much in common with Kafka's *The Trial*.

In his first three plays the threat is left deliberately unexplained, so that an aura of mystery surrounds the action and violence actually breaks through, but in *The Caretaker* there develops a more subtle menace from within, threatening the mind rather than the body and there is no overt violence.

The theme of uncertainty has persisted throughout. In his first play, *The Room*, 1957, he mystified his audience by contradictory information about insignificant details. This trick served perhaps to heighten the atmosphere of insecurity but some critics found it irritating, and in later plays, *The Collection*, for instance, we find instead a highly significant uncertainty as to people's veracity and motives. Pinter has explicitly stated that imprecision conveys a truer picture of our experience. "The desire for verification is understandable," he says, "but cannot always be satisfied," and he points out that it is particularly difficult to be precise about people's inner life and motives, especially if they are inarticulate. He consistently rejects the rôle of the omniscient playwright, like Ibsen, and looks at his characters through the eyes of the ordinary observer, frequently puzzled by human inconsistencies.

A related theme has been the ambiguous nature of personal identity, treated with increasing insight, from the puzzle as to who Riley may be in *The Room*, to the pathos of maimed personality in *The Caretaker*, and the possibility of divided personality in *The Lover*. Some of the disturbing fascination that Pinter exerts is due to the state of uncertainty in which he leaves his audience.

As a playwright of the Absurd Pinter is closest in feeling to Beckett, and he shares with Ionesco an awareness of the way that comedy interlocks with tragedy. "Everything is funny," says Pinter, "the greatest earnestness is funny; even tragedy is funny. And I think what I try to do in my plays is to get to this recognised reality of the absurdity of what we do and how we behave and how we speak." Occasionally, like Ionesco, he uses stage "furniture" to heighten the absurdity and both playwrights have a quick ear for the absurd clichés and *non-sequiturs* of everyday speech.

Pinter is a stylist in the use of stage dialogue, an expert in cockney dialect. It is talk rather than dialogue that he records, what Martin Buber has described as "monologue disguised as dialogue," for his characters talk at people rather than to them. They rarely listen or respond, each bolstering up his self-confidence in an intermittent "monologue" spiced with empty boasting. This is particularly appropriate to the confused and defeated people he portrays, who even in their defensive jargon shrink from human contact.

Although Pinter's dialogue appears on the surface to be little more than a tape-recording of casual talk, there is beneath the demotic prose a poetic rhythm more compelling than the carefully calculated verse rhythms of T. S. Eliot.

The Room. 1957. M.

Pinter's first play, written in four days for the drama department of Bristol University, is already characteristic. Rose, left alone at night, is nervously aware of the door of her dingy room, especially when a blind Negro, Riley, enters with a message from her father. Her husband on his return savagely kills Riley and Rose goes blind.

The murder of Riley, possibly a rather clumsy death symbol, is melodramatic, but the lit room is a vivid dramatic image of man's tiny area of comfort in an indifferent universe.

The Dumb Waiter, written 1957, produced 1960. M. and P.

In a one-acter Ben and Gus, hired assassins working for some mysterious "organisation," uneasily await their unknown victim in a basement room in Birmingham. The sudden intrusion of a grotesque Ionesco-like dumb-waiter increases their anxiety, until it is revealed that the victim is Gus himself. Situation and dialogue

are both comic and taut with menace. The trite phraseology, as the killers mention "the senior partner," "the job," and "clearing up," ironically uses a business jargon. The tiny play is a microcosm of a treacherous world where violence can suddenly break up man's apparent alliances.

The Birthday Party. 1958. M.

In Pinter's first full-length play, the room is in a shabby boarding-house kept by the motherly Meg. Here Stanley, who claims to have been a concert pianist, has taken refuge, until he is suddenly unnerved by the arrival of a sinister pair, the specious Goldberg and the brutal McCann who like Gus and Ben are there "to do a job." They subject Stanley to a fantastic catechism, a parody of brain-washing, and during his phoney and ludicrous birthday party he is blindfolded and his glasses broken—symbolic of destructon of vision. Next morning the pair lead Stanley away, conventionally dressed in black jacket and striped trousers, incapable of speech, his personality disintegrated.

The menace here is economically sustained through indirect means, and the fact that the identity of the three main characters is never revealed adds to the terror. Some see Stanley as the political refugee; some, since he was a pianist, as the artist who is made to conform by the pressure of society. But by its deliberate lack of definiteness, the play has a wide reference to all who seek refuge from a strange and hostile world.

The Caretaker. 1960. M.

The play is set in a junk-filled room, where the kindly Aston lives in his brother's derelict house. He brings home an old tramp, Davies, who grudgingly agrees to stay as "caretaker" and then tries to encroach further by playing off one brother against the other, until finally rejected by both.

In a naturalistic background Pinter has created two unforgettable characters, presented in psychological depth with reference to their past, and has depicted their failure to come to terms with compassion and restraint.

Davies is one who bites the hand that feeds him. His very identity is suspect for he passes under an assumed name, having "left his papers" years ago "at Sidcup." But he never retrieves them, like Beckett's Krapp repressing part of his past. Aston haltingly tells Davies how he once had periods of unique lucidity, now destroyed by a terrifying shock-treatment he was subjected to in mental hospital, but Davies' only reaction is later to threaten him. It is remarkable that when Aston finally rejects Davies' last encroachment the plight of the tramp should seem as pitiful as Aston's own, Pinter having wisely rejected his first intention to end the play with the violent death of Davies.

This mature play shows a man actually opening the door to his fears and mastering them. Aston in his long speech faces the wrong done to him by "people." His unique vision destroyed, his only creative outlet has been tinkering with his hands, but as he tries to break out of his isolation by befriending another crippled human being, he unhappily meets a man so twisted by his own suffering and resentment that he cannot respond. Some find in Aston a moving image of the mystic and artist in man whose creative insight is destroyed by an imperceptive and mechanical society. The film is excellent.

A Slight Ache. 1961. M.

A short play, first heard on the Third Programme in 1959, shows an elderly couple haunted by a match-seller, who stands speechless at their gate. Eventually the wife takes him into the home instead of the husband. It is possible that the silent match-seller may represent the unconscious desires of the wife and the anxieties of the husband.

A Night Out. 1961. M.

First broadcast and televised in 1960, this compassionate and realistic brief play shows the clerk, Albert, trying one night to escape from the retarding domination of his nagging and self-righteous mother. After threatening her violently he finally finds himself in the room of a prostitute who proves equally peevish and would-be genteel. It is doubtful whether Albert's violent gestures have won him any independence.

The Collection. 1962. M.

In an assured, sophisticated comedy of manners, originally presented on television in 1961, Pinter makes authentic use of mystification.

Did Stella in fact sleep with a stranger, Bill, in Leeds? She tells James, her husband, that she did so, but during the course of the friendship that develops between the two men, Bill gives three contradictory accounts of what is supposed to have occurred, while Harry, an older man who has given Bill a home, becomes increasingly jealous of James.

There is irony in that Stella's story, told perhaps to pique her husband, should impel him away from her to male society and the changing of partners has the elegant formality and economy of a dance movement.

Pinterian violence is here only lightly indicated; in James' half playful throwing a knife at Bill and in Harry's ferocious account of him as a "slum slug" that he has picked up.

The Lover. 1963. M.

An arresting short play shows the husband (Alan Badel) and the wife (Vivien Merchant) first as affectionate but distant partners, and then with provocative change of clothes as erotic lovers. The performance of symbolic rôles, including dressing up in fetish garments, had already been used by Genet. Pinter cleverly adapts the device to discriminate between the apparently incompatible strands in the marriage relationship, a distinction analogous to that between Aphrodite Urania and Aphrodite Pandēmus, the Love Sacred and Profane of classical mythology.

The Homecoming. 1965. M.

Teddy (Michael Bryant), a Doctor of Philosophy in an American University, brings his wife, Ruth (Vivien Merchant), on a surprise visit to his former home in North London, where Max (Paul Rogers), his widowed father, still lives with his two younger sons, Lenny and Joey. It is gradually revealed that Ruth before her marriage had been a "model" and the family decide to keep her as their common mistress, while Lenny, a pimp, arranges that she shall earn her keep as a prostitute. The plot is underlined by Lenny's bragging anecdotes of sexual brutality—a counterpart to the more undifferentiated violence of the earlier plays.

Because this black comedy is played with clinical detachment, the audience is induced to suspend emotion. Only at the last moment is this cool acceptance shattered by an outburst of human feeling when Max, aged 70, crawls sobbing to Ruth asking to be kissed and the audience is shocked into feeling the degradation involved.

On the surface the play is a disillusioned glance at life. "It would be ridiculous to maintain that what we know merits reverence," says Lenny. It may also be interpreted as a fantasy of sexual gratification, which in a dream state escapes the taboo of ethical and humane feeling and can be indulged in without demur. The use of some accepted sex symbols and the slow and trance-like acting, especially that of Ruth, is dream-like in its effect and the final shock of degradation is analogous to waking up and realising what the dream has implied.

It is possible also to see in Teddy an acquiescent Hamlet. He returns home from a foreign university to find marital infidelity, for it is disclosed that his mother had been unfaithful with an uncle figure. Ruth is the counterpart of Ophelia, who was bidden by Hamlet, "Get thee to a nunnery"—(an Elizabethan cant term for brothel). Teddy is like Hamlet also in that he prefers "to operate on things and not in things."

The Homecoming is professionally brilliant, but it lacks the depth of reference and emotional power of Pinter's earlier plays.

Hal Porter. An Australian playwright.

The Tower. P.

Set in Hobart in 1850, a well-constructed traditional play tensely presents violent passion and incident veiled by the steely dialogue of mannered society.

The Professor. 1965.

A play set in the Far East, with a Japanese heroine, was less successful.

Terence Rattigan (b. 1912).

With a flair for witty farce and social comedy, Rattigan expertly serves up a nourishing morsel in an appetising *vol-au-vent.*

More recently he has attempted to penetrate suffering as in *The Browning Version*, 1948, and *The Deep Blue Sea*, 1952. *Variations on a Theme* was less successful and incidentally provoked Shelagh Delaney into writing her first play.

David Rudkind.

Afore Night Come. 1962. P.

In a Worcestershire orchard the fruit pickers enact the ritual murder of a freakish old tramp whom they dread as a threat to their virility. A realistic working day world is infused with the primitive terror of *The Golden Bough.*

Jean-Paul Sartre (b. 1905).

The plays of the French philosopher, Sartre, can be fully interpreted only in the light of his atheistic existentialist philosophy. Discarding conventional morality, Sartre insists that the individual must evolve his own ethical code through daring freely to choose and act for himself. He must also will this freedom for others, and by seeking to establish an interdependence of freedoms he "engages," or "commits" himself in the political struggle.

Sartre himself is a communist and his best plays, like those of Brecht, are fully "committed" to left-wing ideology. They have sought to vindicate the inevitability of violence in the struggle for freedom and to decry the "bourgeois morality" which shrinks from such crime.

Sartre is also concerned with the "absurdity" of man's predicament as a rational creature in an illogical and indifferent universe, but unlike Ionesco he presents the situation, not through absurd images but through the medium of the traditional well-made play.

Sartre has had a considerable influence on the climate of ideas, encouraging an attitude of harsh disillusion and stimulating the current discussion as to whether or not drama should be a vehicle for social and political convictions. It is interesting to contrast the views of Wesker and Pinter on this issue.

Lucifer and the Lord. Published 1951. P.

The dilemma between non-violence and force is here given greater universality by being projected back into the time of the Peasants' Revolt in Germany. The brilliant General Goetz, having failed in a policy of Christian love, unflinchingly embraces a ruthless violence as the only possible "realist" social ethic.

Nekrassov. Published 1956.

A satirical farce ridicules the sensational anti-communism of a section of the popular French press.

Altona. Published 1956. P.

This play, showing a former Nazi officer going mad in an attempt to justify his own resort to torture, is an attack on "Western morality" in its own recourse to torture, used by French colonials in Algiers. The film version well reproduces the claustrophobic horror.

James Saunders (b. 1925).

In Saunders' early work the influence of Ionesco is apparent in the satirical use of a banal dialogue, in which the characters converse without communicating, and in the reference to some concrete symbol which represents their anxieties or predicament. His later work is reminiscent of Pirandello. Nevertheless Saunders' ingenious plays have a freshness and vigour all their own.

Alas Poor Fred.

In a one-act play a friend who had some time ago been cut in half is the symbol of a married couple's former passionate love life, long since sundered. The situation is like that of Ionesco's *Amédée.*

The Ark. 1959.

In a more direct style this full-length play of ideas re-interprets the Old Testament story.

Ends and Echoes. 1960.

This is the general title for three clever one-acters. In *Barnstable*, the most amusing one, a house is gradually collapsing around its unwitting inhabitants, a symbol of the disintegration of their conventional way of life.

Next Time I'll Sing to You. 1963.

Based on Raleigh Trevelyan's book on the hermit of Canfield, who died in 1942, this moving play uses the rehearsal style of Pirandello's *Six Characters*. Like an elegiac quintet is explores the theme of solitude.

A Scent of Flowers. 1964.

Like the previous play, this is a reconstruction of the past. It is gradually revealed that the character, Zoe, is in fact the spirit of a girl who has just committed suicide, because her love for a married man is incompatible with her religion. The play proceeds by her touching encounters with the circle of relatives and friends to whom she had turned in vain for help.

Neighbours. 1967.

Neighbours was presented with another short play, *Dutchman* (F), byLeroi Jones. Both use an emotional encounter between a Negro and a white woman to focus the strain between the races.

A Negro invites himself into the flatlet of a young woman on the floor below. With some hesitation she entertains him. He then steadily challenges her enlightened liberalism as merely patronising and finally in what amounts to moral blackmail asks her to come and sleep with him. Confused and compassionate she yields.

The initial meeting is conveyed with much delicacy. Then as the Negro assumes the rôle of counsel for the prosecution, a logical pattern is unconvincingly forced on the naturalistic material.

Alan Seymour. An Australian dramatist.

The One Day of the Year. P.

Like Lawler's *Summer of the Seventeenth Doll*, this realistic and moving play examines one of Australia's cherished legends—this time the celebrations of Anzac Day. It is set in Sydney in the working class home of the sentimental "digger," Alf Cook, whose son Hughie is at the university. Alf's deep anger and hurt when Hughie publishes his satirical photographs of the Anzac Day celebrations in which Alf had taken part focuses the universal clash between generation, culture, and class.

Peter Shaffer

Shaffer is an assured and ingenious dramatist whose first success was with the realistic well-made play and who has since moved on to freer modes of composition.

His plays operate successfully on two levels: they offer insight into the subtleties of personal relationships, especially into the difficulties of adjustment between people of different cultural background, and they also involve discussion of ideas. The aesthetic problem of distinguishing between genuine love of art and snobbish pretension is a recurring theme, often presented in a triangular situation.

Five Finger Exercise. 1958. P.

An alive, realistic play shows Clive, the young Cambridge student, growing away from his stifling mother, with her pretensions to modish culture, but failing to make contact with his honest philistine father. The advent of an enigmatic stranger, Walter, acts as a catalyst. Mother and son are both attracted to Walter, the father's fierce jealousy is aroused and Walter is narrowly saved from suicide.

Shaffer shows some of Ibsen's precision in his

probing of a family situation where the members change and develop as they become painfully aware of their hidden drives.

The Private Ear and the Public Eye. 1962.

Two short and spare triangular plays both demonstrate the influence of artistic taste on the relationship between the sexes.

The Private Ear.

Bob, a shy music-lover, asks Ted to help him entertain a girl whom he has met at a concert. But the ignorant girl is won by the complacent Ted's vulgar patter and Bob, left alone, defaces his gramophone record and forces himself to listen to the broken music of love.

The Public Eye.

A witty, ironic comedy shows Charles, a correct and pompous dilettante, unwarrantably jealous, employing a private detective, Louis (Kenneth Williams) to spy on his wife. She becomes attracted to Louis because of their shared joy in things of beauty. With the entry of the iconoclastic Louis, a brilliant, comic invention, farce and tenderness go hand in hand with high comedy

The Royal Hunt of the Sun. 1964.

A sweeping " epic " drama of Pizarro's fantastic conquest of Peru skilfully uses, as narrator, " old Martin ", who watches his own boyhood as page to Pizarro. Shaffer deploys " total theatre " in dazzling ceremonial, processions and masks, in ritual dancing, mime and strange, metallic music.

There is rich thematic material in the clash of " two immense and joyless powers ", in the conflict of Christianity and Sun worship. Personal tragedy develops in the mutual attraction felt by the grizzled Pizarro (Colin Blakeley) and the young Inca, Atahualpa (Robert Stephens). Captor and prisoner, they painfully seek for the god in each other and the Inca accepts death both as a sacrifice to friendship and the final test of his faith.

Black Comedy. 1965.

A highly successful brief comedy frankly uses an effective device of Chinese theatre. During a party the lights fail and the stage, although supposed to be in darkness, is still fully illuminated, so that the ludicrous behaviour of the dramatis personae is visible only to the audience.

Robert Shaw (b. 1927).

The Man in the Glass Booth! 1967.

Donald Pleasance played the chief part with dazzling virtuosity in an arresting and histrionic play based on Shaw's own novel.

The American tycoon, Goldman, is profoundly disturbed by the irony of the Pope's announcement that the Jews have been forgiven for the crucifixion for, German Jew in origin, he had known the agonies of the concentration camp. He acts strangely, and disguises himself as his double, his cousin Dorff. Dorff, a gentile German, had been a colonel in the S.S. in the same camp and notorious for his sadism.

Goldman, now Dorff, contrives that Eichmann-like he shall be kidnapped by Israeli agents. At his trial he justifies Nazism, makes accusation and insinuations against the Jews and gloats over the obscene cruelties which had defiled the victims. When an old woman reveals his true identity, the mystified court point out that his devil's advocacy has harmed his own people.

The heart of the play, Goldman's motivation, remains a confusing puzzle. Is he an anti-semitic Jew? Does he imagine himself as a Christ figure suffering vicariously? Is he demented by past agonies? Or is the author trying to depict sado-masochism, the whole spectrum of man, the light and shadow in the Jungian sense, not only of the individual but also of the race? Or is Shaw not not entirely in control of complex material derived from the leisurely form of the novel?

The play certainly suffers structurally from having only one protagonist circled by flat figures so that there is plenty of assertion and rhetoric but little valid confrontation, discussion, or elucidation. It presents not a genuine dramatic conflict but a contrived enigma.

Much time is wasted in the opening sequence in establishing the Hollywood ostentation and sentimentality of Goldman's apartment and the verbal style see-saws between argot and the florid and pretentious.

It is interesting to contrast *The Investigation* of Weiss, whose fidelity and austerity have an overwhelming effect.

N. F. Simpson (b. 1919).

N. F. Simpson's plays of the Absurd are in the peculiarly English vein of Lewis Carroll and Edward Lear, a world of surrealist fantasy, *non-sequitur* and nonsense. It is almost a contradiction in terms to organise such material coherently and to do so in a full-length play is a *tour de force* which Simpson brought off in his *One Way Pendulum*. His best work ridicules the mechanical and conventional existence, the attenuation of feeling, of the little suburban home, his usual milieu.

The Resounding Tin [illegible] 1957. P.

A most unusual [illegible] which pokes fun at suburban life, discards plot, progress, and characterisation, and the [illegible]form dialogue is one continuous flow of [illegible]er verbal paradoxes and *non-sequiturs*. The apologetic " author " appears at intervals and in the final act there is a parody discussion of the play by a panel of " critics "—devices used by Ionesco in *The Shepherd's Chameleon*.

Simpson's verbal agility is exhilarating, but some find the play over-cerebral. It is certainly at the opposite end of the spectrum from Ann Jellicoe's *The Sport of My Mad Mother*.

One Way Pendulum. A Farce in a New Dimension. 1959. F.

Here Simpson has devised a framework built of whimsy and yet firm enough to carry its own logic and to be dramatically satisfying. The characters are drawn simply, but consistently, each with his own " humour," in the manner of Ben Jonson and the dialogue is a close parody of banal family interchange.

The play concerns a suburban family, the Groomkirby's, whose son, Kirby, is teaching a collection of weighing-machines to sing the Hallelujah Chorus. His ineffectual father is combining his two favourite hobbies of law and " do it yourself " carpentry, by building an enormous model of the Old Bailey in the living-room, where the phlegmatic mother pays a charwoman to eat up the " left-overs."

Finally a trial takes place in the Old Bailey and Kirby is convicted of murdering forty-three people in order that he may wear black, the weighing-machines being part of a complicated device to cause a holocaust of death.

The main theme of the play is the tyranny of things, which is exemplified by the absurd Ionesco-like objects. These are treated with the respect due to human beings while human beings are treated as things, and father and son are so obsessed by things that they cannot get into touch with one another.

The tyranny of mechanical routine and social custom is also indicated. Kirby will only eat when a cash-register rings and will only wear black when it is sanctioned by funeral convention.

The anxiety and guilt which result from a starved and mechanical existence are finally symbolised in the nightmare parody of a trial scene in the final act.

Although the stage objects are novel and intriguing and can be assigned a clear meaning they lack the suggestive power of Ionesco's chairs or rhinoceroses. Contrived rather than intuitive, they illustrate more than they illuminate the human condition. But the play is an original and successful experiment and the implied comment on the unconscious assumptions and compulsive habits of the Groomkirbys has a wide reference.

The film version is recommended.

The Cresta Run. 1965.

A play about counter-espionage proved disappointing, partly because its mockery is directed at a schoolboy dream rather than at a general malaise, partly because it lacks the bold structural

outline of *One Way Pendulum*. Even the absurd objects—keys, codes, disguises—are trivial compared with the "Old Bailey." Simpson has also lost some of the claustrophobic compulsion of his earlier plays by his constant switching of the action from the home of the suburban couple to the Ministry and back again.

It is unfortunate that a promising latent theme —the compulsion felt by the Security man to divulge his secret information—is swamped by trivia, while the best jest is only a casual aside—the suggestion that in England Intelligence should logically be in the hands of private enterprise!

The Hole, 1957, and *The Form* are one-acters in the same style as the full-length plays.

Wole Soyinka (b. 1934).

Soyinka, a Nigerian and an English graduate, is an admirer of Brecht, Arden, and Dürrenmatt.

The Road. 1965.

The Road, set in a drivers' haven in Nigeria, successfully produced with a large cast of coloured actors, later won a Dakar award.

The Lion and the Jewel. 1966. O.U.P.

In a lively comedy, presented by the Ijinle Company of African actors, the jewel is Sidi, the belle of a Yoruba village. Elated at being photographed for a glossy magazine, she rejects both the native schoolmaster and the old chieftain, the Lion, until cunning seduced by him she exultantly joins his harem.

Native culture, with vivid ritual dance and music, is presented as more alluring and virile than European, which is mocked both in amusing mimes and in the shabby, ineffective schoolmaster infatuated with Western gadgets.

Tom Stoppard (b. 1937).

Stoppard has written plays for radio, including the engaging *Albert's Bridge*, and for television.

Rosencrantz and Guildenstern are Dead. 1966. F.

Stoppard's diverting play is a gloss on *Hamlet* and he dovetails snatches of Shakespeare's tragedy with his own action or rather inaction, for his archtype is Beckett's *Waiting for Godot*.

He humorously chooses as protagonists the two nonentities, Rosencrantz and Guildenstern. Summoned inexplicably to Elsinore, they hang about, always on the fringe of great events they do not understand, passing the time, like Shakespearean jesters, in witty word play and fruitless speculation as to their situation and destiny.

Their predicament is a suggestive image of the bewilderment of the ordinary man faced with world events beyond his grasp and, at a deeper level, with the existential problem of man's very being on this earth, and the imminence of death.

The rehearsals of the Players, the counterpart of the enactments of Pozzo and Lucky in *Godot*, create a further film of unreality and illusion.

The play is too long, the second act not sufficiently contrasted with the first, but it is remarkable that a play which clearly has its provenance in Shakespeare and Beckett should be so delightfully fresh and original.

David Storey.

Storey has written plays and novels, including *This Sporting Life*.

The Restoration of Arnold Middleton. 1967.

Arnold is a jesting, eccentric young schoolmaster whose latest acquisition is an outsize suit of armour, but his clowning disguises an inner malaise. He is less attracted to his wife than to his mother-in-law, and he eventually assaults her and becomes plainly unhinged. Only when she departs is he suddenly restored to his wife and sanity.

Here is an interesting first play on a theme reminiscent of Mercer's *Morgan*, with the gorilla suit. Storey however does not offer sufficient interpretation of his protagonist's instability nor of his lightning recovery. The exuberant hilarity of the comedy confounds the issue.

Cecil P. Taylor.

Taylor is quizzically interested in left-wing types, especially their inconsistencies and fallacies. He is very successful in a brisk, brief comedy like *Allergy*, 1966 (P). In *Bread and Butter*, 1966 (P) his naturalistic outline biography of two Jewish couples in the Gorbals between 1931 and 1965 is sympathetically done but too slight to sustain the full-length play.

Gwyn Thomas (b. 1913).

The Keep. 1962.

A realistic and fluent comedy of character in a South Wales home is strengthened by the sardonic twist of its surprise ending.

Jackie the Jumper. 1963.

A period play with music is set in the Chartist era.

Jose Triana (b. 1931).

Triana, born in Cuba, spent four years in Madrid but returned to Cuba after Castro's revolution and has now written several plays.

The Criminals. 1967.

The first Cuban play staged here depicts three adults, a brother and his two sisters, acting out fantasies of childhood, hatred of thwarting parents, and the tyranny of home, which culminate in a frenzied ritual of their murder of the parents at the end of Act One. The trial of the children in Act Two gradually develops into an enactment of the parents' mutual detestation. As the curtain falls the ritual begins afresh.

This intense play, in the genre of "Theatre of Cruelty" (q.v.), has less wealth of imagery than Weiss's *Marat-Sade* but a greater universality of reference than Genet's world of criminals and perverts. It may have been influenced by the work of Arrabal, the Spanish playwright working in France, whose characteristic, says Esslin, is the "highly disturbing mixture of innocence and cruelty."

Triana shows great psychological insight; children's play is often a dramatic projection of their inner anxieties and conflicts and at all ages the sterile process of fantasy gives only temporary relief and must be endlessly and exhaustingly repeated. The most significant moment of the play is when the word "love" is timidly offered as an alternative only to be rejected.

An extremely apt parallel to Triana's vision was the contemporary Reith lecture (26 Nov. 1967), when Dr. Leach, the social anthropologist, criticised our unthinking acceptance of the inward turning type of family life, where "parents and children huddled together in their loneliness take too much out of each other. The parents fight: the children rebel." Of such a family Dr. Leach said, "The strain is greater than most of us can bear," and he considered it to be the source of our social discontents.

Triana's play effectively shows it as a potent source of man's aggression. Some critics have seen in it implications of Castro's resistance to the dominance of America.

Peter Ustinov (b. 1921).

Ustinov's versatile and ingenious comedies have proved more popular than his serious plays. Recent productions include *Romanoff and Juliet*, 1956, *Photo Finish*, 1962, and *Halfway up the Tree*, 1967.

Boris Vian (1920–59).

The French Vian was influenced by the Absurdist approach of Ionesco.

The Empire Builders. 1962.

Man's futile flight from death is imaged in a family trying to escape from a terrifying noise by moving up to a higher and higher floor and meaner quarters. Eventually the father alone reaches the attic, where he dies.

The Generals' Tea Party. 1966. P.

Written in 1951, Vian's biting, absurdist satire on the military mentality represents his general

behaving like a small boy, afraid of Mama, and asking his playfellows—other generals—to tea. After deciding that war would be a nice idea, they then select the target—prophetically Algeria.

Roger Vitrac (1899–1952).

The French Vitrac, an associate of Artaud, attempted Surrealist plays which anticipate the Theatre of the Absurd.

Victor. 1964.

Victor is a boy of 9 but 7 foot tall and with a mature intelligence. He and his outsize girl-friend are the only rational beings in a farcical adult world.

Peter Weiss (b. 1916).

The German-speaking Weiss has adopted Swedish nationality and Marxist doctrine.

The "Marat Sade." 1964.

The full title of this verse play, one of the most impressive exemplifications of Artaud's Theatre of Cruelty, is *The Persecution and Assassination of Jean-Paul Marat as Performed by the Inmates of the Asylum of Charenton under the Direction of the Marquis de Sade!* As the title indicates this complex work operates on receding planes of cruelty, thus exciting in the audience that vivid experience of violence which is the aim of Artaud.

Artaud's demand for primitive ritual which shall exorcise repressed fantasy is met not only by Corday's threefold visit and murder of Marat but also by the lunatics' frenzied miming of the ceremony of the guillotine—a background motif to the whole play. Meanwhile the use of pantomime and gesticulation on the open stage satisfy Artaud's demands for spectacle, for "poetry in space."

Peter Brook, the brilliant Director, has pointed out that these elements are not inconsistent with a Brechtian "alienation"—achieved by the device of a play within a play, the protesting comments of the Director of the asylum, the intellectual debates between Sade and Marat and not least by the ribald songs of a grotesque quartet of zanies. The final effect is an inextricable blend of the comic and the violent.

The Investigation. 1965.

A documentary of the Frankfurt War Crime Trials, edited by Weiss, had a multiple première in East and West Germany and at the Aldwych. Described by Weiss as an "Oratorio in 11 Cantos," after Dante's *Inferno*, it indicts the millions, including the German monoply capitalists, who tacitly supported the Nazi atrocities.

At the first impact the grisly facts leave an overwhelming impression of horror. It is remarkable that the author's restraint and dignity in presenting them and the formal austerity of his design have in retrospect the effect of catharsis.

Arnold Wesker (b. 1932).

Wesker, son of a Jewish-Hungarian father and a Russian mother, first became a chef, and worked in Norwich, London, and Paris, before taking a six months' course at the London School of Film Technique, where he wrote his first play.

He is known not only as a dramatist but also as a devoted socialist. Since 1962 much of his time has been given to his efforts to bring an enjoyment of good drama and art to people who would otherwise lack opportunity. To this end he has founded—under the aegis of the Trade Unions—the well-known Centre 42.

Wesker's early plays were in the naturalistic idiom, centred on the vivid portrayal of an East End Jewish family and a farm-labourer's family in Norfolk. He evidently found naturalism inadequate and there gradually appeared in his work strains of Expressionism, which in *Chips with Everything* became the dominant style. Wesker's hold on dramatic structure is erratic, but he has an exhilarating sense of movement on the stage.

His most individual characteristic is his passionate concern for his characters. They are presented in the round, living, aspiring, and erring, so that they achieve an independent existence, especially the women. Although male protagonists like Ronnie Kahn and Pip are seen both in their strength and weakness. Wesker does not entirely detach himself from them, somehow conveying his personal reactions to them—a conflict of love and exasperation. He has nevertheless gone much further than Osborne, for instance, in creating a truly objective image, as his more flexible dialogue indicates. He has a keen ear for social and personal idiosyncracies, especially urban Jewish volubility and the fumbling speech of the country labourer.

Like Sartre, Wesker is deeply "committed." He is a convinced socialist but not a propagandist, for his plays explore the moral and practical difficulties of the socialist position and he shows unusual honesty in portraying Ronnie Kahn, the most vocal of socialists, as a weak if not renegade personality.

The Trilogy—The trilogy consists of three naturalistic plays in which a discursive history of the Jewish family, the Kahns, is fused with political debate on the course of socialism

Chicken Soup with Barley. 1958. P.

This is the springboard of the trilogy. It opens on October 4, 1936, the morning of Moseley's attempted march through the East End of London, when the curtain rises on the basement flat of the Kahns, a Jewish family dedicated to socialist activities. It is 1957 when the play ends with the disillusion of the son, Ronnie, at the Russian occupation of Hungary.

Each of the Kahns is a live human being, presented not for moral judgment but with sympathy. Especially commanding is the mother Sarah. What Jung might call an "extraverted feeling type," she is ignorant of events, contemptuous of books, a strenuous mother figure, and yet in her aggressive dynamic the most masculine person of the group, in contrast to her amiable but shiftless husband, Harry, and the vacillating Ronnie.

The central theme of the play is the conflict between attitudes of mind, "caring," or concern for the welfare of others, and indifference to it. The battle is fought on two fronts, in the home and politically, it being taken for granted that socialism is an expression of "caring." The stalwart Sarah is the centre of the two-fold conflict, for she attacks both social inertia and that of her husband and son.

Structurally the play is sprawling, but Wesker already shows his intuitive sense of theatrical movement. At the end of Scene I there is an exhilarating leap forward as the little band of fighters surges from the basement to the light. A more experienced dramatist might have placed such a triumphal movement as the final climax, but the general pattern of the play is of recoil and listlessness, held only by Sarah's unshakeable faith in caring and Ronnie's honesty with himself.

Roots. 1959. P.

There is here a skilful shift of scene to Norfolk, where Beatie Bryant (Joan Plowright), a farm-labourer's daughter on holiday from London, revisits her family. Beatie is engaged to Ronnie, who has for three years been trying to educate her, especially in the arts and in the intelligent use of words (the "bridges" of communication). She has ignored his advice but endlessly parrots his sayings to her phlegmatic family.

Preoccupied with the primal necessities of life the Bryants are the coarse "roots" from which Beatie has sprung. In spite of a rough friendliness they are ignorant, prejudiced, stubborn, and above all inarticulate.

When on the day appointed for his visit, Ronnie sends instead a letter saying their marriage would not work, Beatie is at last galvanised by shock into finding thoughts and words of her own. These folk she realises are without spiritual roots or standards. Then comes her ecstatic moment of self-realisation. She is at last thinking and speaking for herself.

Although he does not know it Ronnie has

realised his ambition, " to save someone from the fire."

The play is well constructed, the characters and dialogue are convincing, Beatie delightful. The ideas discussed about " roots " and " bridges," develop organically from the situation.

I'm Talking about Jerusalem. 1960. P.

In 1946 the Kahns' daughter and her husband, Dave, settle in Norfolk to put into practice the theories of William Morris, but Dave, finding that his hand-made furniture cannot compete economically with the factory product, faces their failure and in 1959 they return to London.

The theme of disillusion is here fully analysed by the voluble Kahns, but the mood escapes despair and Dave's self-respect and sober appraisal of unpalatable facts is contrasted with the embittered cynicism of a friend.

The play is weak structurally. There is insufficient action and Dave is not a sufficiently commanding figure to hold things together. Then the intimate study of tender family relationships, suitable to a novel, is embarrassing, except for brief moments on the public stage.

Two symbolic moments in Act II indicate that Wesker was realising the limitations of realism. One is the miming of a simple ritual of reconciliation, the other a ritual enactment of the story of creation.

The Trilogy as a Whole—Wesker's trilogy throws up vital questions of good and evil both personal and social, the chief perhaps being that of heredity. Must Ronnie and Beatie inherit their parents' limitations? Is Mrs. Bryant right when she says, " The apple don't fall far from the tree "? Is man foredoomed and his struggle vain? Ironically it is the undependable Harry who suggests that giving people some love may help them to change, while of socialism he says, " It'll purify itself." Who was right and in what degree?

The Kitchen. 1959. P.

In a two-acter, Wesker draws on his experience as a chef to give a vivid impression of a day in the kitchen of Marango's restaurant. The play is notable for its skilful contrasts in pace and movement. The quiet morning quickens to a frenzy of anxiety at lunch-time, and the doldrums of the afternoon are succeeded by the sudden outburst of a German who goes beserk.

The swirling vortex is an image of the blind activity of society, and, while avoiding the rigidity of allegory, Wesker clearly indicates that the kitchen is a microcosm of the world, where men with their casual contacts find themselves in a situation beyond their grasp. The play ends with the dramatic irony of Marango's failure to perceive that work and food alone cannot satisfy man's desires.

Although it destroyed the claustrophobic atmosphere the film version caught very well the movement of the play.

Chips with Everything. 1962. P.

In *R.U.R.* (*Rossum's Universal Robots*) the Expressionist playwright, Karel Capek, used robots as dramatis personae. In *Chips with Everything* Wesker brilliantly deploys the techniques of Expressionism to illustrate the process whereby military discipline can reduce individuals to a robot-like uniformity, both the complacency of authority and the inertia of the ranks.

A squad of nine R.A.F. conscripts is subjected to a battery of bullying abuse from the corporal and psychological manipulation by the commissioned officers, until, their personal identity submerged they learn to move as one mechanical unit and pass out to the blaring of a military band playing " God Save the Queen."

Expressionism is particularly appropriate to his purpose. He uses type characters to represent social forces—the best example being Corporal Hill—and the identity of the recruits is, with two exceptions, indicated very lightly. The dialogue is for the most part staccato, while brief, stylised, symbolic scenes, such as the square bashing and bayonet practice, succeed one another rapidly, a triumphant instance of Wesker's innate command of stage movement.

As to the two recruits presented in greater detail: the plight of the gentle Smiler, broken and suffering, is sufficiently generalised to give pathos and depth to the play without disturbing its tone, but the predicament of Thompson is treated with too much psychological detail to be in key, especially as the portrait is not entirely convincing.

The son of a general, Thompson is at first resistant to authority and appears to be trying to assume leadership of the squad. But the habits of a class that can eat " chips with everything " are too distasteful for him, and accused by the recruits of " slumming " and assailed by the blandishments of the officers, he suddenly capitulates and assumes officer's uniform.

The overall effect is tense and powerful and scenes of moving comedy, such as the breath-taking mime of stealing coke, alternate with those where the audience, facing the same direction as the recruits themselves, cannot escape feeling the obliterating effects of the military machine.

The Four Seasons. 1965. P.

The course of love through the four seasons of the year is traced through the shared experience of a man and woman whose previous marriages had foundered. Wesker has unfortunately applied an Expressionist style to unsuitable material, a static situation without incident or plot and the experiment has proved unsuccessful.

Their Very Own and Golden City. 1966. P.

The driving power of an unusual play is probably Wesker's own struggle to realise a communal and artistic ideal in Centre 42.

He skilfully integrates a sweeping expressionistic panorama of social trends since 1926 with the creation of rounded, idiosyncratic characters. The inspired architect, Andrew Cobham, has a vision of the ideal city that shall set a pattern of living for the community, but its full achievement is thwarted by obscurantist Trade Unions and by his accepting the patronage of a Tory Minister and a capitalist industrialist. Andrew's emotional life is split between frustrated friendship with an aristocratic girl and estrangement form Jessie, his homely wife.

A vantage point is offered by recurring dream-like scenes in Durham Cathedral. Acting as a flash forward they show Andrew the youth with his fellows and Jessie. Ecstatic with joy at the sublimity of the cathedral he envisages his own life-work. But the final scene, in keeping with the disillusion and compromise that have blighted his vision, serves as a sad, ironic flash-back.

John Whiting (1915–63).

John Whiting was an original playwright who was much preoccupied with the theme of self-destruction, but was slow to find his own style.

A Penny for a Song. 1951.

Written at a time of great personal happiness this is an agreeable whimsy, depicting two eccentric brothers in their Dorsetshire residence preparing to repel the armies of Napoleon. The appearance on the stage of a balloon and a home-made fire-engine give the authentic period touch of gentlemanly interest in scientific invention, and also impart to the farcical idyll a dash of pantomime.

Whiting cleverly gives a comic perspective to the recent fear of foreign invasion and so takes the sting out of terror.

Saint's Day. 1951.

This play, written before *A Penny for a Song*, won the award in a Festival of Britain Play Competition.

It concerns self-destruction, its central figure being the octogenarian Paul Southman, once a famous revolutionary poet who had long ago gone into self-imposed exile because of popular outcry against his work.

The plays opens well. Southman is a striking figure, an embodiment of the angry artist at war with society, and like Swift in his aggressive scorn of compromise, his scurrilous style and final madness. His situation is at first sufficiently distanced to be convincing, but when the fashion-

able young writer Procathren introduces the glossy contemporary world it begins to seem implausible. Later Procathren accidentally kills Paul's grand-daughter, Stella, and then orders three deserting soldiers to hang Paul and Stella's husband, also an artist, and the initially powerful theme is swamped by melodrama.

The play generally is overloaded with half-developed symbolism and allusion.

Marching Song. 1954. P.

In a play much concerned with the existentialist stress on the inescapability of choice, Whiting returns to the theme of self-destruction.

The setting is generalised—a wealthy house "above a capital city in Europe." Rupert Forster, formerly a general, who seven years previously had inexplicably lost a decisive battle, here meets his dilemma. He must either face a trial, which might cause political unrest, or commit suicide. The choices are represented by two people.

In Act II Forster encounters Dido, a young woman who revives his sense of humanity and will to live. She represents the female side of personality, the Jungian anima and her name recalls the Dido of the Æneid, who by her love deflected Æneas from the path of military duty enjoined by fate.

In Act III he has a very different meeting with Captain Bruno, the embodiment of military ambition, who represents the male aspect of personality. To him Forster at last confesses the cause of his fatal defeat. He had been so overcome with compassion for children whom he had destroyed while they were impeding his tanks that he had been unable to follow up his advance. Bruno stigmatises the delay as military error and guilt and Forster commits suicide rather than face disgrace and imprisonment

This is a strongly constructed play, its dominating theme worked out with single-minded austerity. But it lacks thrust and momentum. Forster's reversion to his original decision to commit suicide gives it a circular movement and it is more concerned to clarify judgment of the past than to affect the future. In its acknowledgment of the discrepancy between military code and humane ethic it is highly topical and stimulating.

The Devils. 1962. P.

Suggested to Whiting by Peter Brook, this intricate and distinguished play is based on Aldous Huxley's *The Devils of Loudun*, which treats of an actual case of suspected diabolism in France between 1623 and 1634.

Whiting employs two focal points. One is Grandier (Richard Johnson), again a man who invites his own destruction, a worldly and sensual priest who is yet gifted with a rare religious insight and compassion. The other is a hunchback prioress (Dorothy Tutin). Although she has not met Grandier, she becomes obsessed by fantasies of his amorous adventures and her resulting hysteria, which spreads throughout the convent, is suspected as diabolical possession, instigated by Grandier. Richelieu, for political reasons, uses this as a pretext to get rid of him. Grandier, in spite of excruciating torture and degradation, the prelude to his being burnt alive, struggles to retain his faith.

In its subject and theme *The Devils* is strikingly similar to Miller's *The Crucible*. Both plays show *l'homme moyen sensuel* accused of diabolism and beset by a woman's jealousy, fanatical superstition, and malignant spite, yet still keeping his integrity in the face of death.

There are significant differences. Whiting's intricate play is not realistic but Brechtian in style with a series of brief episodes and a commentary by a sewerman, whose ironic and sceptical remarks counterpoint Grandier's eloquence. It lacks Miller's reference to the contemporary scene and its final note is one of harsh pessimism, as the sewerman tells the prioress that Grandier's bones are being prized by the crowd as superstitious "charms."

The final act presents an almost unbearable spectacle of a barbarous ritual of physical torture as the maimed and twitching Grandier is paraded in public procession through the streets.

Tennessee Williams (b. 1914).

The American Tennessee Williams is a playwright of great talent, whose freely flowing naturalistic plays combine violence and melodrama with haunting portrayal of personality, fluent dialogue, and original settings.

Of recent years the following major plays have been produced in Britain: *The Glass Menagerie*, 1948, revived 1965 (P); *A Street Car Named Desire* 1949 (P); *The Rose Tattoo* (P); *Cat on a Hot Tin Roof* (P); *Camino Real*, the least realistic play, 1957 (P); *Suddenly Last Summer* (P), *Period of Adjustment*, 1961, and *The Two-Character Play*, 1967.

Although his plays breathe the atmosphere of the Deep South—often decadent in tone—Williams, unlike the extravert Miller, is preoccupied not with social issues but with the inner life of his characters. Compelled by their own passions and obsessions and caught in the web of family relationships, they break away only at great cost and pain to themselves and others, so that a mood of determinism, sombre but not altogether despairing, broods over much of Williams' work.

He portrays the vulnerability of those who desire or love anything intensely, humanity's sense of guilt, defiant aggression and despair, all of which he claims to find within himself. The violence characterising so much of his work reaches its climax in *Suddenly Last Summer*.

Especially poignant are Williams' penetrating psychological studies of life's pathetic failures; the crippled Laura retreating to her glass menagerie, Blanche Dubois, of *Street Car*, and the alcoholic Brick and his childless wife in the *Cat*.

The Two Character Play. 1967.

Like the early *The Glass Menagerie*, the play treats of an ill-omened brother–sister relationship.

Believing them to be mad, the cast of a touring theatrical company have just deserted the two star actors, a brother and sister, Felice and Clare. Alone on the stage, the pair hysterically decide to put on Felice's own work, *The Two Character Play*. This play within the play is also about a brother and sister who stay immured in an overgrown house in their terror of facing the world outside. Their father had killed their mother and then committed suicide and people now suspect the brother–sister relationship. Whether it is the relationship of Felice and Clare or of the dramatic personae is left ambiguous in a Pirandello-like piece hovering on the confines of reality and illusion, sanity, and madness.

Charles Wood (b. 1932).

Wood is known for his plays *Cockade*, 1963, three one-act plays, two directly concerned with the army, and for *Fill the Stage with Happy Hours*, 1967 (P).

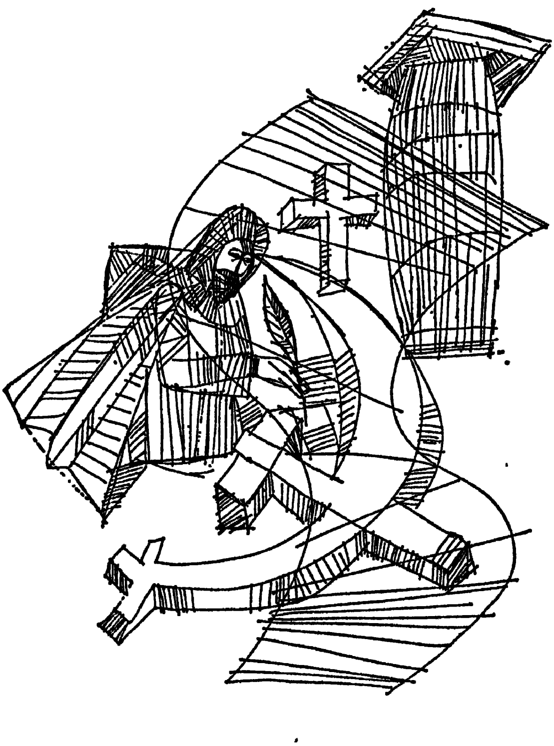
Dingo. 1967.

Wood uses some expressionist techniques to present a phantasmagoria of the last War, beginning in the desert and grinding through Stalag to the unconditional surrender of Germany. It is an assault on the emotions and sensations in a passionate attempt to bring home war's physical horror and spiritual attrition, but Wood's specific concern is to expose latent jingoism and political expediency and the futility of the heroism they demand.

The scurrilous words matter less than certain persistent images: the ranker, Dingo, epitome of bitter disillusion; Tanky, rendered simple-minded because he was powerless to release his mate, screaming to death in a flaming tank; an ENSA comedian who serves to parody Churchillian rhetoric, and breezy morale-boosting of High Command; a young subaltern, dressed as a blonde in a bikini for a concert party designed to cover an escape from Stalag, and now, with Tanky, lolling dead from the barbed wire.

The play is powerful but sprawling, cluttered, one-sided. It attacks the idea that Britain played a more disinterested rôle than in previous wars. It was fought, not for others, says Dingo, but "for all the usual reasons," an emotive statement that needs scrutiny.

IDEAS & BELIEFS



IDEAS AND BELIEFS

This section explains many of the ideas and beliefs which people have held at different periods in history. Beliefs may be true or false, meaningful or totally meaningless, regardless of the degree of conviction with which they are held. Since man has been moved to action so often by his beliefs they are worth serious study. The section throws a vivid light on human history.

Man has always felt a deep need for emotional security, a sense of "belonging." This need has found expression in the framing of innumerable religious systems, nearly all of which have been concerned with man's relation to a divine ruling power. In the past people have been accustomed to think of their own religion as true and of all others as false. Latterly we have come to realise that in man's religious strivings there is common ground, for our need in the world today is a morality whereby human beings may live together in harmony.

There is also to be found in man an irresistible curiosity which demands an explanation of the world in which he finds himself. This urge to make the world intelligible takes him into the realm of science where the unknown is the constant challenge. Science is a creative process, always in the making, based on experiment and rational argument, and fired by curiosity and imagination. Basic scientific ideas and some of the results of recent scientific activity are to be found in Section F.

In this dictionary the subjects fall broadly into three groups: religious, philosophical, and political. In writing of beliefs, especially cherished beliefs, and of how they fit into the modern picture of the world, it is difficult to avoid causing some offence but the reader is assured that the writer has tried to be fair and helpful.

A

Abecedarians, name (derived from A B C) of a small German religious sect, founded by the Anabaptist Storch in 1522, who claimed that, as knowledge of the Scriptures was communicated directly by the Holy Spirit, it was wrong to learn to read. *See* **Baptists**.

Activists, those in a political movement who insist on taking active steps towards their objectives rather than merely putting forward a programme.

Adoptionism, in Christianity, a doctrine advanced at various times which holds that Jesus was not born divine but, in virtue of his human spiritual achievements, was designated by God as the Son of God at the moment of his baptism in the Jordan, as told in all the four Gospels. Among the sects who held this "heretical" doctrine were the Paulicians (*q.v.*). The "Adoptionist" view differs from the orthodox "Conceptionist" view only in regard to the moment in the life of Jesus when the incarnation took place.

Adventists, a group of American religious sects, the most familiar being the Seventh-Day Adventist Church, which observes Saturday as the true Sabbath. With more than a million members throughout the world, it shares with other Adventists a belief in the imminent second coming of Christ (a doctrine fairly widespread in the U.S.A. during the early decades of the 19th cent. when the end of the world was predicted by William Miller for 1843, then for 1844). Modern Adventists content themselves with the conviction that the "signs" of the Advent are multiplying, the "blessed event" which will solve the world's ills. Believers will be saved, but the sects differ as to whether the unjust will be tortured in hell, annihilated, or merely remain asleep eternally.

Agnosticism. *See* **God and Man**.

Albigenses, also known as **Cathari**. French 12th cent. heretical sect (named after the town of Albi in Provence), who maintained that material things belonged to the realm of Satan and that salvation was to be achieved by crushing all animal instincts, particularly the sexual instinct: universal continence would end the domination of matter by the extinction of the human race. The eating of animal flesh was forbidden and vegetarianism enjoined in order to weaken the desires. Those who rigidly kept to these rules were initiated into the grade of the "Perfect"; those unable fully to comply were known as the "Believers". Condemned as heretics by Pope Innocent III, the sect was finally exterminated in the Albigensian Crusade led by Simon de Montfort towards the end of the 12th cent. (In his thoroughness, de Montfort also succeeded in destroying the high culture of the Troubadours.) *See* **Manichaeism**.

Alchemy, ancient art associated with magic and astrology in which modern chemistry has its roots. The earliest mention of alchemy comes from ancient Egypt but its later practitioners attributed its origins to such varied sources as the fallen angels of the Bible, to Moses and Aaron, but most commonly to Hermes Trismegistus, often identified with the Egyptian god Thoth, whose knowledge of the divine art was handed down only to the sons of kings (cf. the phrase "hermetically sealed"). Its main object was the transmutation of metals. Egyptian speculation concerning this reached its height during the 6th cent. in the Alexandrian school. Brought to Western Europe by the Moslems, one of its most famous Arab exponents was Jabir (*c.* 760–*c.* 815), known to the Latins as Geber, who had a laboratory at Kufa on the Tigris. One school of early Greek philosophy held that there was ultimately only one elemental matter of which everything was composed. Such men as Albertus Magnus (1206–80) and Roger Bacon (1214–94) assumed that, by removing impurities, this *materia prima* could be obtained. Although Bacon's ideas were in many ways ahead of his time, he firmly believed in the philosopher's stone, which could turn base metals into gold, and in an elixir of life which would give eternal youth. Modern science has, of course, shown in its researches into radioactivity the possibility of transmutation of certain elements, but this phenomenon has little bearing on either the methods of the alchemist or the mysteries with which he surrounded them.

Anabaptists. *See* **Baptists**.

Analytical Psychology, the name given by Carl Gustav Jung (1875–1961) of Zürich to his system of psychology which, like Adler's Individual Psychology (*q.v.*), took its origin from Freud's psychoanalysis (*q.v.*) from which both diverged in 1911. Briefly, Jung differed from Freud: (1) in believing that the latter had laid too much emphasis on the sexual drive as the basic one in man and replacing it with the concept of *libido* or life energy of which sex forms a part; (2) in his theory of types: men are either extrovert or introvert (*i.e.* their interest is turned primarily outwards to the world or inwards to the self), and they apprehend experience in four main ways, one or other of which is predominant in any given individual—sensing, feeling, thinking, or intuiting; (3) in his belief that the individual's unconscious mind contains not only repressed material which, as Freud maintained, was too unpleasant to be allowed into awareness, but also faculties which had not been allowed to develop—*e.g.*, the

emotional side of the too rational man, the feminine side of the too masculine one; (4) in the importance he attaches to the existence of a collective unconscious at a still deeper level which contains traces of ancient ways of thought which mankind has inherited over the centuries. These are the *archetypes* and include vague primitive notions of magic, spirits and witches, birth and death, gods, virgin mothers, resurrection, etc. In the treatment of neuroses Jung believed in the importance of (*a*) the present situation which the patient refuses to face; (*b*) the bringing together of conscious and unconscious and integrating them.

Jung's school of thought is undeniably not popular with scientific psychologists, but his emphasis on the more spiritual side of man's nature has brought him support from those of a religious or philosophical turn of mind, notably in the Roman Catholic Church.

Anarchism, a political philosophy which holds, in the words of the American anarchist Josiah Warren (1798–1874), an early follower of Robert Owen, that "every man should be his own government, his own law, his own church." The idea that governmental interference or even the mere existence of authority is inherently bad is as old as Zeno, the Greek Stoic philosopher, who believed that compulsion perverts the normal nature of man. William Godwin's *Enquiry Concerning Political Justice* (1793) was the first systematic exposition of the doctrine. Godwin (father-in-law of Shelley) claimed that man is by nature sociable, co-operative, rational, and good when given the choice to act freely; that under such conditions men will form voluntary groups to work in complete social harmony. Such groups or communities would be based on equality of income, no state control, no property; this state of affairs would be brought about by rational discussion and persuasion rather than by revolution.

The French economist Proudhon (1809–65) was the first to bring anarchism to the status of a mass movement. In his book *What is Property?* he stated bluntly that "property is theft" and "governments are the scourge of God." He urged the formation of co-operative credit banks where money could be had without interest and goods could be exchanged at cost value at a rate representing the hours of work needed to produce each commodity. Like Godwin, he disapproved of violence but, unlike Marx, disapproved of trades unions as representing organised groups.

In communistic anarchism these ideas were combined with a revolutionary philosophy, primarily by the Russians Michael Bakunin (1814–76) and Peter Kropotkin (1842–1921) who favoured training workers in the technique of "direct action" to overthrow the state by all possible means, including political assassination. In 1868 anarchists joined the First International which broke up a few years later after a bitter struggle between Bakuninists and Marxists. Subsequently small anarchist groups murdered such political figures as Tsar Alexander II of Russia, King Humbert of Italy, Presidents Carnot of France and MacKinley of America, and the Empress Elizabeth of Austria.

Anarchism and communism differ in three main ways: (1) anarchism forms no political party, rejects all relationship with established authority, and regards democratic reform as a setback; (2) communism is against capitalism, anarchism against the state as such; (3) both have the final goal of a classless society, but anarchism rejects the idea of an intermediate period of socialist state control accepted by communism. Philosophical anarchists, such as the American writer Henry David Thoreau (1817–62), were primarily individualists who believed in a return to nature, the non-payment of taxes, and passive resistance to state control; in these respects Thoreau strongly influenced Gandhi as did the Christian anarchist Tolstoy. *See also* **Syndicalism**.

Anglicanism, adherence to the doctrine and discipline of the Anglican, as the genuine representative of the Catholic Church. *See* **Church of England**.

Anglo-Catholicism. To Queen Elizabeth I the Church of England was that of the "middle way" in which human reason and commonsense took their place beside Scripture and Church authority. The extent to which these various factors are stressed creates the distinctions between "high" and "low" church. Anglo-Catholics tend to reject the term "Protestant" and stress the term "Catholic" and, although few accept the infallibility of the Pope, some Anglo-Catholic churches have introduced much or all of the Roman ritual and teach Roman dogmas. *See* **Catholicism**, **Tractarianism**.

Animatism, a stage in primitive religion in which life is attributed to inanimate objects.

Animism (see above) is a more advanced stage in which it is believed that natural objects may be the *abodes* of souls or spirits.

Anthropomorphism, the ascription of human physical and moral qualities to God or gods (in psychology to gods or animals). Psychologists use the term *Anthropopathy* for the ascription of such qualities specifically to the Deity.

Anthroposophy, a school of religious philosophic thought based on the work of Rudolf Steiner (1861–1925), a German theosophist. His best known work is in education and medicine. The centre of the Anthroposophical Society is at Goetheanum, Basel, Switzerland. Schools, curative homes, and clinics are to be found in many parts of the world. Though concerned with reincarnation and destiny, anthroposophy is essentially Christian in outlook.

Anticlericalism, resentment of priestly powers and privileges, traceable in England to Wyclif's insistence in the 14th cent. on the right of all men to have access to the Scriptures. The translation of the Bible into the common tongue was a great landmark in the history of the Bible and the English language. Wyclif's principles were condemned by the Roman Church of his time but were readily accepted during the Reformation. Tudor anticlericalism arose from motives ranging from a greedy desire to plunder the riches of the Church to a genuine dislike of the powers of the priesthood whose spiritual courts still had the right to decide on points of doctrine or morals in an age when the layman felt he was well able to decide for himself. In innumerable ways the Church was permitted to extort money from the laity. It is generally agreed, says Trevelyan, that the final submission of church to state in England was motivated quite as much by anticlericalism as by Protestantism. The rise of the Reformed churches in England satisfied the people generally and anticlericalism never became the fixed principle of permanent parties as happened in France and Italy from the time of Voltaire onwards.

Antisemitism, a term first applied about the middle of the last century to those who were anti-Jewish in their outlook. Although this attitude was prevalent for religious reasons throughout the Middle Ages, modern antisemitism differed (*a*) in being largely motivated by economic or political conditions, and (*b*) in being doctrinaire with a pseudo-scientific rationale presented by such men as Gobineau (1816–82) and Houston Stewart Chamberlain (1855–1927), and later by the Nazi and Fascist "philosophers." Beginning in Russia and Hungary with the pogroms of 1882 it gradually spread south and westwards where, in France, the Dreyfus case provided an unsavoury example in 1894. Thousands of Jews from Eastern Europe fled to Britain and America during this period; for in these countries antisemitism has rarely been more than a personal eccentricity. During the last war the murder of six million Jews by the Nazis and their accomplices led to a further exodus to various parts of the world and finally to the creation of the state of Israel.

The individual Jew-hater makes unconscious use of the psychological processes of projection and displacement: his greed or sexual guilt is projected on to the Jew (or Negro or Catholic) because he cannot bear to accept them as his own emotions, and his sense of failure in life is blamed on his chosen scapegoat rather than on his own inadequacy.

But there are social causes too and politicians in some lands are well versed in the technique of blaming unsatisfactory conditions (which

they themselves may have in part produced) upon minority groups and persuading others to do the same. Historically, the Jew is ideally suited for this role of scapegoat: (1) in the Middle Ages when usury was forbidden to Christians but not to Jews, the latter often became moneylenders incurring the opprobrium generally associated with this trade (*e.g.*, to the simple-minded Russian peasant the Jew often represented, not only the "Christ-killer," but also the moneylender or small shopkeeper to whom he owed money); (2) many trades being closed to Jews, it was natural that they concentrated in others, thus arousing suspicions of "influence" (*i.e.* Jews are felt to occupy a place in certain trades and professions which far exceeds their numerical proportion to the population as a whole); (3) even with the ending of ghetto life, Jews often occupy *en masse* some parts of cities rather than others and this may lead to resentment on the part of the original inhabitants who begin to feel themselves dispossessed; (4) Jews tend to form a closed society and incur the suspicions attached to all closed societies within which social contacts are largely limited to members; marriage outside the group is forbidden or strongly disapproved of, and the preservation, among the orthodox, of cultural and religious barriers tends to isolate them from their fellow citizens. Discrimination, hateful as it is, does not come from one side only and it is such barriers as these that help to maintain an old and cruel folly. *See* **Racism, Zionism, Judaism.**

Antivivisection, opposition to scientific experimentation upon live animals based, according to its supporters, both on the moral grounds of the suffering imposed, and on the less secure claim that many doctors and scientists of repute have rejected the value of information gained in this way. It is true that the protagonists of the movement during its early days in the mid-19th cent. included a number of eminent physicians and surgeons, but few today—whatever their moral scruples—would deny the value of the results obtained. The Animal Defence and Anti-vivisection Society (one of the half-dozen or more in Britain) claims to have co-ordinated medical opposition by "the foundation of various associated medical bodies and the publication of numerous articles by members of the profession whilst at the same time drawing attention to methods of prevention and cure of disease not associated with animal experimentation." These include such methods as homeopathy, nature cure, herbalism, physiotherapy, hydrotherapy, and psychotherapy of which it would be not unfair to say that the first three are long outdated and the last three are merely auxiliary methods of treatment in specific diseases. Without animal experiments we should be without vaccines sera, or antitoxins against smallpox, tetanus, typhoid, diphtheria, poliomyelitis, and a multitude of other diseases; we should have no detailed knowledge about vitamins, or about the effects of radioactive fall-out; we would be unable to test out new drugs for safety before using them on human beings.

Apartheid, an Afrikaans word meaning "apartness," referred to by South African Government spokesmen as "separate development" or "self-development." To others it means the system of total racial discrimination between Black and White South Africans—the permanent inhabitants of the country—as enforced by the Nationalist Party since it came to power in 1948. Some degree of racial segregation has existed in South Africa since the earliest days of colonialism in the mid-17th cent. and the policy was continued by the United Party under Smuts and Hertzog from 1934 onwards though it was never a political issue. This changed when the Nationalist Party gained power and oppressive measures against the non-White segment of the population have grown steadily under Malan, Strydom, Verwoerd and Vorster. *Apartheid* involves the beliefs in racial purity and *baaskap* or white supremacy which is maintained by discriminatory legislation. The official policy of the South African Government is to create separate self-governing Black states in which the Africans would be guided to self-government and, it is claimed, eventually to independence. The first so-called bantu reserve was set up in the Transkei in 1962. But Africans with 70 per cent of the population would have only about 13 per cent of the land; cities and mineral areas would remain the reserve of the Whites. Total *apartheid* or complete separation of the Black and White races in South Africa remains unlikely to be realised since mining, the main industry of the country, is based on relatively low-paid African labour.

Apartheid has been condemned by the General Assembly of the United Nations and the Secretary-General, U Thant, has expressed the hope "that, in response to the repeated recommendations and decisions of the United Nations organs the Government of the Republic of South Africa will abandon its policies of *apartheid*, and also implement measures aimed at bringing about racial harmony based on equal rights and fundamental freedoms for all the people of South Africa." *See also* **Section C, Part I.**

Apollinarianism, the heretical belief taught by Apollinaris (*c.* 313–*c.* 390), bishop of Laodicea, near Antioch, that in Jesus the human mind was replaced by the Divine Mind or Logos. The sect was later absorbed by the Monophysites (*q.v.*).

Arianism, formed the subject of the first great controversy within the Christian Church over the doctrine of Arius of Alexandria (d. 336) who denied the divinity of Christ. The doctrine, although at first influential, was condemned at the Council of Nicaea (325), called by the Emperor Constantine, at which Arius was opposed by Athanasius, also of Alexandria, who maintained the now orthodox view that the Son is of one substance with the Father. Arius was banished and the heresy had died out by the end of the 4th cent., but disbelief in the divinity of Christ has formed part of the doctrine of many minor sects since, notably in Unitarianism (*q.v.*).

Arminianism, the doctrine of Jacobus Arminium or Jakob Harmensen (1560–1609), the Dutch minister of a Protestant church in Amsterdam, who had trained in the universities of Leyden and Geneva where he learned the Calvinistic doctrine of predestination (*See* **Calvinism**). Later he became deeply convinced of the falsity of this belief which maintained that God had, by an eternal decree, predestined which people were to be saved and which eternally damned. In face of the bitter opposition of his opponent Franz Gomar and his party who held this view, Arminius asserted that God bestows forgiveness and eternal life on all who repent and believe in Christ. In England a modified Arminianism was later to become the theology of Wesleyan Methodism.

Assassins, a sect of Moslem Shi'ites, founded by the Persian Hasan i Sabbah (*c.* 1090), which for more than two centuries established a rule of terror all over Persia and Syria. The coming of the Mongols in 1256 destroyed them in Persia and the Syrian branch suffered a similar fate at the hands of the then Mamluk sultan of Egypt, *c.* 1270. It was a secret order, ruled over by a grand master, under whom the members were strictly organised into classes, according to the degree of initiation into the secrets of the order. The devotees, belonging to one of the lower groups, carried out the actual assassinations under strict laws of obedience, and total ignorance of the objects and ritual of the society. It is believed that the latter were given ecstatic visions under the influence of hashish, whence the term *hashshashin*, which became corrupted to "assassin."

Associationism. In psychology, the Associationist school of the 19th cent. accepted the association of ideas as the fundamental principle in mental life. It was represented in Britain by the two Mills and Herbert Spencer, in Germany by J. F. Herbart (1776–1841). To these, mental activity was nothing but the association of "ideas" conceived of as units of both thought and feeling—the emotion of anger or the perception of a chair were both "ideas"—and apart from them the self did not exist. Personality was simply a series of these units coming and going, adding to or cancelling each other out, in accordance with rigid and mechanistic scientific laws.

Assumption of the Virgin. The Roman Catholic

belief, that the Blessed Virgin ascended bodily to heaven after her death, was proclaimed by Pope Pius XII towards the end of 1950. It is now, therefore, binding on all Catholics under pain of anathema and the guilt of mortal sin. Protestants are liable to make the mistake of supposing that such dogmas are new additions to the faith invented by the pope of the moment. According to Catholic doctrine, no addition can be made to the "faith once delivered to the saints," and every dogma is justified by reference to Bible texts and the traditions of the Church. Both Eastern and Western Churches have been permitted to believe in the Assumption of the Virgin for over a thousand years, and the new dogma merely clarifies the old belief and makes it binding on the faithful.

Astrology, a pseudo-science bearing much the same historical relationship to astronomy as alchemy did to chemistry. Originally it was divided into the two branches of Natural Astrology which dealt with the movements of the heavenly bodies and their calculation, and Judicial Astrology which studied the alleged influence of the stars and planets on human life and fate. It was the former that developed into modern astronomy; the latter was, and remains, sheer superstition.

Astrology owes most to the early Babylonians (or Chaldeans) who, being largely nomadic in an environment which permitted an unobstructed view of the sky, readily accepted the idea that divine energy is manifested in the movements of the sun and planets. Gradually this concept became enlarged and the relative positions of the planets both in relation to each other and to the fixed stars became important together with the idea of omens—that, if a particular event occurred whilst the planets were in a particular position, the recurrence of that position heralded a recurrence of the same sort of event. Soon the planets became associated with almost every aspect of human life. They were bound up with the emotions, with parts of the body, so that astrology played quite a large part in medicine up to late mediaeval times. Not only was the position of the planet to be considered but also the particular sign of the zodiac (or house of heaven) it was occupying, and it was believed possible to foretell the destiny of an individual by calculating which star was in the ascendant (*i.e.* the sign of the zodiac nearest the eastern horizon and the star which arose at that precise moment) at the time of his birth. Astrology was popular among the Egyptians, the Romans (whose authorities found the Chaldean astrologers a nuisance and expelled them from time to time), and during the Middle Ages when astrologers were often highly respected. Because of people's innate desire to see into the future there are, alas, still astrologers about to exploit ignorance.

Atheism. *See* God and Man.

Atomism. (1) in philosophy, the atomists were a group of early Greek thinkers, the most important of whom were Leucippus (fl. *c.* 440 B.C.) and his younger contemporary Democritus (*c.* 460–370 B.C.). Prior to these men, although it had been agreed that matter must be composed of tiny ultimate particles and that change must be due to the manner in which these mingled or separated from each other, it was supposed that there existed different types of particle for each material—*e.g.* for flesh, wood, hair, bone. The atomists taught that atoms were all made of a single substance and differed only in the connections (pictured as hooks, grooves, points, etc.) which enabled them to join each other in characteristic ways. Theirs was the first move towards modern atomic theory and a predecessor of the modern concept of chemical linkages. (2) in psychology, atomism refers to any theory which holds that mental states can be analysed without loss into elementary units, *e.g.* Associationism and Behaviourism (*q.v.*).

Authoritarianism, a dictatorial form of government as contrasted with a democratic one based on popular sovereignty. Its alleged advantages are the avoidance of the delays and inefficiency said to be characteristic of the latter, but like "Bolshevism" the word is used today mainly as a form of abuse.

B

Baconian Method, the use in science and philosophy of the inductive (as opposed to the deductive or Aristotelian) method of reasoning as proposed by Francis Bacon (1561–1626). Deduction argues from supposedly certain first principles (such as the existence of God or Descartes's "I think, therefore I am") what the nature of the universe and its laws *must* be, whereas Bacon denied the possibility of proving religious or metaphysical doctrines by thought and argument. The only means of obtaining true knowledge of the universe, in his view, was by the amassing of facts and observations so that when enough were obtained the truth would be known in the same way that a child's numbered dots in a playbook joined together by a pencilled line create a picture. This method, known as induction, is essentially the method of modern science, although it is generally agreed today that Bacon underrated the importance of hypothesis and theory since the greatest possible number of observations are of little significance until the scientist's intuition makes sense of them.

Baptists, a Christian denomination whose distinctive doctrines are that members can only be received by baptism "upon the confession of their faith and sins" and that "baptism in no wise appertaineth to infants." Baptism is therefore by total immersion of adults. Modern Baptists base their doctrines upon the teaching of the Apostles and some hold that the Albigenses (*q.v.*) maintained the true belief through what they regard as the corruption of the Roman Church in mediaeval times. On the other hand any connection with the Anabaptist movement during the Reformation is rejected and the beginning of the modern Church is traced to John Smyth, a minister of the Church of England who in Amsterdam came under the influence of the Arminians (*q.v.*) and Mennonites. Smyth died in 1612 when the first Baptist church in England was built at Newgate. This, the "General" Baptist Church, rejected Calvinistic beliefs and held the Arminian doctrine of redemption open to all, but some years later a split occurred with the formation of the "Particular" Baptist Church which was Calvinist in doctrine. In 1891 the two bodies were united in the Baptist Union and today the sect is spread throughout the world, notably in the U.S.A.

The Anabaptist movements of Germany, Switzerland, and Holland also practised adult baptism in addition to a primitive communism and demanded social reforms. Persecuted by both Catholics and Protestants, their leader, Thomas Münzer, and many others were burned at the stake (1525). However, this sect was noted for its violence under a religious guise, and its taking over of the state of Münster in 1533 was characterised by wild licentiousness, since, as Antinomians, they believed that the "elect" could do no wrong. A revival begun by Menno Simons (d. 1561), a Dutch religious reformer, led to the formation of the Mennonite sect which, whilst rejecting infant baptism, gave up the objectionable features of the Anabaptists This reformed sect still exists as small agricultural groups in the original strongholds of the movement and in the United States.

Beat Generation, a term first used by the American writer Jack Kerouac in his novel *The Town and the City* to define various groups spread across the face of the country, but notably New York and San Francisco, which, belonging to the post-war generation, represented a complex of attitudes. Briefly, these are: rejection of the values of the past and lack of conviction in the possibility of a future for humanity—hence an acceptance of nothing but the immediate present in terms of experience and sensations; rebellion against organised authority, not out of any political conviction (as in the case of anarchism), but rather from lack of any interest or desire to control events, nature, or people; contempt for the "Square"—the orthodox individual who, stuck firmly in his rut, "plays it safe" and remains confident of the rightness and decency of his moral values. The "Beatnik" has con-

tracted out of what one of them describes as "an increasingly meaningless rat-race rigged up by and for Squares" which wastes effort and brutalises feeling. He loathes the pretences without which, he claims, the Square cannot succeed, and throwing off all masks is indifferent to the opinions of others, his dress, or the need to work, thus entering into "the inescapable truth and squalor of his own being." He "digs" (likes) everything, tries everything from drugs to sexual relationships, which have no significance outside the sensations of the moment to the advanced Beatnik or "hipster." All men are addressed as "man," all women as "chick." Of course, the above is an intellectualisation by such Beat writers as Kerouac, Allen Ginsberg, and Carl Solomon or Norman Mailer of a philosophy which for many Beatniks would be meaningless, being satisfied with any excuse for their own exhibitionism, sexual promiscuity, and psychopathic tendencies. Beards (in men), bare feet, sloppy clothes, and unwashed bodies were the familiar Beatnik uniform.

The Beat generation of the 1940s and 50s has given way to the Love generation or Flower people, with their flowers, beads, and cowbells. Their social philosophy is the same—living in the present, unconventionally, seeking personal freedom, believing drugs to be essential, claiming to be acting against the rat race, dissociating themselves from politics, taking a superficial interest in the religions of the East, borrowing much of their language, music, and ideas on dress from the American "hippy": yet believing in the creation of a new and gentler society based on different forms and values with only the weapons of love and flowers to bring it about.

Behaviourism, a school of psychology founded in 1914 by J. B. Watson (1878–1958), an animal psychologist at Johns Hopkins University, Baltimore. Its main tenet was that the method of introspection and the study of mental states were unscientific and should be replaced by the study of behaviour. When animals or human beings were exposed to specific stimuli and their responses objectively recorded, or when the development of a child, as seen in its changing behaviour, was noted, these alone were methods which were truly scientific. Watson contributed an important idea to psychology and did a great deal towards ridding it of the largely philosophical speculations of the past. But he also went to absurd extremes, as in his view that thought is nothing but subvocal speech, consisting of almost imperceptible movements of the tongue, throat, and larynx (*i.e.*, when we think, we are really talking to ourselves), and his further opinion that heredity is, except in grossly abnormal cases, of no importance. He claimed that by "conditioning," the ordinary individual could be made into any desired type, regardless of his or her inheritance.

The work of Ivan Pavlov had begun about 1901, but was unknown in America until about ten years later, and it was through another Russian, Vladimir Bekhterev, that the concept of "conditioning" was introduced into the country. Bekhterev's book *Objective Psychology*, describing his new science of "reflexology," was translated in 1913 and played a great part in the development of Behaviourist ideas. The conditioned reflex became central to Watson's theory of learning and habit formation (*e.g.*, he showed that a year-old child, at first unafraid of white rats, became afraid of them when they came to be associated with a loud noise behind the head). Finally all behaviour, including abnormal behaviour, came to be explained in terms of conditioned responses; these were built up by association on the infant's three innate emotions of fear, rage, and love, of which the original stimuli were, for the first, loud noises and the fear of falling; for the second, interference with freedom of movement; and for the third, patting and stroking. The Behaviourist method is widely used all over the world as a technique in psychological research, but in the Western world there remain few Behaviourists of the out-and-out Watsonian type. The work of Freud has made it impossible to ignore the importance of introspection in psychology.

See **Utilitarianism.**

Bolshevism, an alternative name for **Communism** (*q.v.*), usually used in the West in a derogatory sense. When the Russian Social Democratic Party at a conference held in London in 1903 split over the issue of radicalism or moderation, it was the radical faction headed by Lenin (who subsequently led the 1917 Revolution and became first Head of State of the Soviet Union) which polled the majority of votes. The Russian for majority is *bolshinstvo* and for minority *menshinstvo*; hence the radicals became known as Bolsheviki and the moderates as Mensheviki, anglicised as Bolsheviks and Mensheviks. *See* **Communism, Marxism.**

British Israelites, a religious group who hold the race-theory that the English-speaking peoples (of the White Race) are the lineal descendants of the "lost Ten Tribes" of Israel (deported by Sargon of Assyria on the fall of Samaria in 721 B.C.). They believe the Anglo-Saxons to be God's "Chosen People" in the literal sense of the term as it is used in the Old Testament by whom the world will be brought in readiness for the Millennium. The official organisation is the British–Israel World Federation of which the official journal is the *National Message*. Some British Israelites have the notion that the future can be foretold by the measurements of the Great Pyramid.

Buddhism, one of the great Oriental religions. It arose against the background of Hinduism in north India in the 6th cent. B.C., its founder (real or legendary) being the Hindu prince Siddhartha Gautama, known as the Buddha or "Enlightened One." Distressed by the problem of human suffering from which even death allowed no escape—since Buddha accepted the Hindu doctrine of a cycle of lives—he left his palace and his beloved wife and child to become a religious mendicant and ascetic, studying without success for six years the beliefs of Brahmin hermits and self-torturing recluses. After this fruitless search he sat down under a tree (the Bo-tree) and finally came to understand the cause and cure of suffering. The result of his meditations are enshrined in the "four noble truths" which are: (1) that existence is unhappiness; (2) that unhappiness is caused by selfish desire or craving; (3) that desire can be destroyed; (4) that it can be destroyed by following the "noble eightfold path" whose steps are: right views; right desires; right speech, plain and truthful; right conduct, including abstinence not only from immorality but also from taking life, whether human or animal; right livelihood, harming no one; right effort, always pressing on; right awareness of the past, the present, and the future; and lastly, right contemplation or meditation. The more man acquires merit by following these rules in his chain of lives, the sooner is *Nirvana* attained; he loses his individuality, not by annihilation, but "as the dewdrop slips into the shining sea," by merging with the universal life.

Buddhism teaches the way of salvation through ethics and discipline; it preaches the law of *karma*—that a man's actions control his destiny after death as inevitably as cause follows effect, so that his future is solely in his own keeping. A universal God plays no part in this religion, and in many Buddhist nations no word exists for the concept which was neither affirmed nor denied by Buddha himself but simply ignored. Nor did Buddha claim to be other than a man, although much superstition entered the religion at a later date; prayers were made to Buddha, ritual developed, sacred relics preserved under stupas, and the belief in a succession of Buddhas introduced; the sacred writings (*Tripitaka*) are divided into three parts: for the layman, the monks, the philosophers. They were produced by devotees at three councils—the first held immediately after the death of Buddha at the age of 80, the last at the order of King Asoka in 244 B.C. The founder himself wrote nothing.

Buddhism spread to Ceylon, Nepal, Tibet, Mongolia, Indo-China, Burma, Siam, China, and Japan, although on the whole losing influence in India. In Tibet, Buddhism developed into Lamaism (*q.v.*). In Ceylon and Burma it persisted in its pure form (the Hinayana), while in China and Japan it developed into the Maha-

yana with its bodhisattvas and avatars. Sects developed, one of the most important being the Chinese **Ch'an** (Japanese Zen) **Buddhism** (*q.v.*). Outside Asia there are active movements in many Western countries where the serenity and rational humanism of Buddhism appeals to intellectuals as diverse as staid humanists and eccentric beatniks.

Bushido, the traditional code of honour of the Samurai or Japanese military caste corresponding to the European concept of knighthood and chivalry with which it took its separate origin in the 12th cent. Even today it is a potent influence among the upper classes, being based on the principles of simplicity, honesty, courage, and justice which together form a man's idea of personal honour. *Bushido* was strongly influenced by **Zen Buddhism** (*q.v.*).

Calvinism, the branch of Protestantism founded basically (although preceded by Zwingli and others) by Jean Chauvin (1509–64), who was born in Noyon in Picardy. John Calvin, as he is usually called, from the Latin form of his name, Calvinius, provided in his *Institutions of the Christian Religion* the first logical definition and justification of Protestantism, thus becoming the intellectual leader of the Reformation as the older Martin Luther was its emotional instigator. The distinctive doctrine of Calvinism is its dogma of predestination which states that God has unalterably destined some souls to salvation to whom "efficacious grace and the gift of perseverance" is granted and others to eternal damnation. Calvinism, as defined in the Westminster Confession, is established in the Reformed or Presbyterian churches of France, Holland, Scotland, etc., as contrasted with the Lutheran churches, and its harsh but logical beliefs inspired the French Huguenots, the Dutch in their fight against Spanish Catholic domination, and the English Puritans. The rule set up under Calvin's influence in Geneva was marred by the burning at the stake of the anatomist Servetus for the heresy of "pantheism," or, as we should say, Unitarianism.

Perhaps its greatest single influence outside the Church was the result of Calvinist belief that to labour industriously was one of God's commands. This changed the mediaeval notions of the blessedness of poverty and the wickedness of usury, proclaimed that men should shun luxury and be thrifty, yet implied that financial success was a mark of God's favour. In this way it was related to the rise of capitalism either as cause or effect. Max Weber, the German sociologist, believed that Calvinism was powerful incentive to, or even cause of, the rise of capitalism (*q.v.*); Marx, Sombart, and in England, Tawney, have asserted the reverse view—that Calvinism was a result of developing capitalism, being its ideological justification.

Capitalism is an economic system under which the means of production and distribution are owned by a relatively small section of society which runs them at its own discretion for private profit. There exists, on the other hand, a propertyless class of those who exist by the sale of their labour power. Capitalism arose towards the end of the 18th cent. in England where the early factory owners working with small-scale units naturally approved of free enterprise and free trade. But free enterprise has no necessary connection with capitalism; by the beginning of this century monopolies were developing and state protection against foreign competition was demanded. Capitalism is opposed by those who believe in socialism (*q.v.*), first, for the moral reasons that it leads to economic inequality and the exploitation of labour and the consuming public, and that public welfare rather than private profit should motivate the economic system; secondly, for the practical reason that capitalism leads to recurrent economic crises. Defenders of the system, however, maintain that it conduces to efficient production by providing the strongest incentive to enterprise and good service.

Catholicism. For those who are not Roman Catholics the term "Catholic" has two separate meanings. The more general refers to the whole body of Christians throughout the world, the more specific refers to a particular view of Christianity. In this latter sense the Church of England, the Orthodox Eastern Churches, and others consider themselves "Catholic" meaning that (*a*) they belong to Christ's Church as organised on an accepted basis of faith and order; (*b*) they insist on the necessity of "liturgical" worship through established forms (*e.g.*, baptism, holy communion); (*c*) they emphasise the continuity of Christian tradition by the use of ancient creeds (*e.g.*, the Apostles' Creed, the Nicene Creed) and regard the ministry as a succession (Apostolic succession) deriving from early practice. In this sense there is thought to be no necessary contradiction between Catholicism and Protestantism regarded as a renewal of the Church in the 16th cent. by an appeal to the Scriptures as interpreted by the early Fathers of the Church. This definition obviously excludes Quakers, Christian Scientists, and many Nonconformist sects.

The Roman Catholic Church is the religious organization of all those who acknowledge the bishop of Rome as head of the Christian Church, recognizing him as the lawful successor of St. Peter, who was the apostle appointed by Christ to be the head of the Church. Whereas in the Protestant Churches prayer and preaching play a central part (each individual soul seeking direct communication with God), in Roman Catholic worship the central service is the Mass, or Holy Eucharist, the seven sacraments (baptism, confirmation, eucharist, penance, extreme unction, orders, and marriage) being administered by a special priesthood. Church discipline and organisation are strong and authoritarian. *See* **Papal Infallibility**.

Catholic Apostolic Church, a body of Christians which originated in England *c.* 1831, founded on the teaching of Edward Irving (d. 1834). They disapprove of the term "Irvingites" by which they are sometimes known. The common doctrines of Christianity are accepted; symbolism and mystery characterise the elaborate liturgy, and lights and incense are used.

Characterology, the attempt made over many centuries to classify people into personality types on the basis of physical or psychological characteristics. The first attempt was made by Hippocrates in the 5th cent. B.C. who classified temperaments into the *sanguine* (or optimistic), the *melancholic*, the *choleric* (or aggressive), and the *phlegmatic* (or placid); these were supposed to result from the predominance of the following "humours" in the body: red blood, black bile, yellow bile, or phlegm respectively. Theophrastus, a pupil of Aristotle, described, with examples, thirty extreme types of personality (*e.g.* the talkative, the boorish, the miserly, etc.); these were basically literary and imaginative but about the same time "physiognomy" arose which attempted to interpret character from the face. Physiognomy became of importance again during the Renaissance and there are still those today who believe in it in spite of the fact that, broadly speaking, there is no connection whatever between facial features and personality (*i.e.* although it may be possible to tell from the features that a man is an idiot or some extreme abnormal type and some idea of character may be obtained from an individual's characteristic facial expressions, it is not possible to tell (as Johann Lavater, the best-known physiognomist of the late 18th cent. believed) from the shape of the nose, height of the brow, or dominance of the lower jaw, whether anyone is weak, intellectual, or determined). The contention of the 19th cent. Italian criminologist Cesare Lombroso that criminals show typical facial characteristics—prominent cheekbones and jaw, slanting eyes, receding brow, large ears of a particular shape—was disproved by Karl Pearson early this century when he found that 3,000 criminals showed no significant differences of features, carefully measured, from a similar number of students at Oxford and Cambridge.

It has, however, been noted that people in general tend to be intellectual or emotional,

inward- or outward-looking, and this observation is reflected in the classifications of the Scottish psychologist, Alexander Bain (d. 1903), into intellectual, artistic, and practical; Nietzsche's Apollonian and Dionysian types; William James's "tender" and "tough-minded"; and C. G. Jung's introvert and extrovert. Careful experiments have shown that these are not clear-cut and that most individuals fall in between the extremes.

Some connection has been found between temperament and body-build. Ernst Kretschmer (b. 1888) showed that manic-depressive patients and normal people who are extroverted and tend to alternate in mood (as do manic-depressives to an exaggerated degree) are usually short and stout or thick-set in build; schizophrenics and normal people, who both show shyness, serious or introverted reactions, are usually tall and slender. The former of "pyknic" body-build are "cyclothyme" in temperament, the latter with "schizothyme" temperament are of two bodily types—the tall and thin or "asthenic" and the muscularly well-proportioned or "athletic." The American Sheldon has confirmed these observations on the whole and gone into further details. Louis Berman has classified personalities according to the endocrine glands predominating: thus the "adrenal" type is vigorous and persistent, those whose adrenal glands are less active tend to become neurasthenic; the hyperthyroid type is restless, the subthyroid listless; the individual in whom the front part of the pituitary is active is masculine to a high degree, when the posterior pituitary is active he may show feminine traits. It is quite true that in disease of these glands such traits develop but most scientists agree that Berman is over-enthusiastic in his claims so far as normal people are concerned. *See also* Q5(1).

Chartism, a socialistic movement in England (1837–55) which attempted to better the conditions of the working classes. Named after "The People's Charter" of Francis Place (1838), its programme demanded: (1) universal manhood suffrage; (2) vote by ballot; (3) equal electoral districts; (4) annual parliaments; (5) payment of members; (6) abolition of their property qualifications. Chartism was supported by the Christian socialists (*q.v.*), J. F. D. Maurice (1805–72), and Charles Kingsley (1819–75) with certain qualifications.

Chauvinism, a term applied to any excessive devotion to a cause, particularly a patriotic or military one. The word is derived from Nicholas Chauvin whose excessive devotion to Napoleon made him a laughing-stock.

Chirognomy, the attempt to read character from the lines in the hand (as contrasted with Chiromancy, the superstitious attempt to foretell the future in the same way) has few supporters, and not many psychologists would accept that handwriting reveals character in any way that is of practical use. It is highly probable that everything about an individual's acts or productions is *potentially* capable of revealing something about his character; the practical question is whether at present we can interpret them and it is ordinarily agreed that, in the case of the hand and handwriting, we cannot.

Christadelphians, a religious denomination formed in the U.S.A. about 1848 at the time of the American Civil War by John Thomas, an Englishman from London. They claim to represent the simple apostolic faith of the 1st cent., and, in common with many other sects, hold that they alone interpret the Scriptures truly. None but those who share their beliefs will rise from the dead and enjoy immortal life when Christ returns after the battle at Armageddon when His kingdom will be established on earth with its capital in Jerusalem. The political events of our time are regarded as fulfilments of biblical prophecies preceding the millennial reign of Christ over the earth. For them heaven and hell do not exist. In social life Christadelphians keep to themselves and hold aloof from organisational activities, though they do take an interest in political events if only from the point of view of their belief in biblical prophecy.

Christianity, the religion founded by Jesus Christ whose teaching is found in the New Testament's four Gospels. Simple as His creed may seem it soon became complicated by the various ways in which Christians interpreted it, and the differences within the early Church are reflected

in the numerous Councils held to define truth from heresy. The Eastern Church of the Byzantine Empire from the 5th cent. onwards had differed in various ways from the See of Rome and by 1054 the breach became permanent. The 16th cent. Reformation was the other great break in the unity of the Church and once Protestantism had given in effect the right to each man to interpret the Scriptures in his own way, the tendency to fragmentation increased so that, by 1650, there were no fewer than 180 sects, mostly dogmatic and intolerant towards each other. Today there are many more, some of which are mentioned in this section under the appropriate headings. Nevertheless there are signs today that the trend of disunity is being reversed. The modern ecumenical movement, which has its roots in the great missionary movement of the 19th cent., aims to bring about a reunion of Christendom by uniting Christians throughout the world on the simple basis of the acceptance of Jesus Christ as God and Saviour, *i.e.*, on the basis of Christian fellowship. The movement finds expression in the World Council of Churches (*q.v.*). The Christian life is expressed in the words of Christ: "Thou shalt love the Lord thy God with all thy heart and thy neighbour as thyself." For many it is the humanitarian side of Christianity that has meaning today: to accept responsibility for others, as well as for oneself.

Christian Democrats, a term describing the members of moderate Roman Catholic political parties existing under various names in Belgium, France, the German Federal Republic (most German Protestants are in East Germany), Italy, and the Netherlands. In several of these countries they are the largest parliamentary party, their platform being based on a programme of moderate social reform advocated by members who in many cases have been active in wartime resistant movements. In spite of efforts of Dr. Adenauer of Germany and Sr. Fanfari of Italy in 1955 a Christian Democratic International has failed to develop.

Christian Science, a religious denomination founded by Mary Baker Eddy (1821–1910), an American lady who sought to organise a church which would reinstate primitive Christianity and its lost element of healing. The sacred book of the movement is *Science and Health with Key to the Scriptures* published by Mrs. Eddy. Its main tenets are that nothing is real save God; that man's essential nature is spiritual and wholly good; that matter, evil, disease, and sickness are unreal—illusions of our mortal minds due to "wrong thinking." Therefore doctors, medicine, surgery and drugs are rejected as irrelevant, spiritual healing being the only cure for what is really mental error. Spiritual healing is claimed to have been brought about in many diseases by Mrs. Eddy herself, by the reading of her book, and, today, by Christian Science practitioners. The name of the movement is misleading since it has nothing to do with any of the natural sciences of which Mrs. Eddy had no first-hand knowledge. Mrs. Eddy was first interested in spiritualism, and afterwards, having been a patient of a faith-healer named Quimby, to whom she was indebted more than she cared to admit, she put herself forward as a mind-healer, claiming that she herself had been divinely healed. The denomination is apparently a wealthy one with widespread membership; its excellent newspaper the *Christian Science Monitor*, read by many outside the movement, gives well-written accounts of all the world events we imagine to be going on around us.

Christian Socialism, a movement launched in 1848, a year of revolutions throughout the continent, by a group in England designed to commit the Church to a programme of social reform. The leaders, notably J. F. D. Maurice, Charles Kingsley (both Anglican clergymen), and John Ludlow were deeply moved by the wretched conditions of the British working class and the two priests had, indeed, given active support to the Chartist movement (*q.v.*). However, all insisted that socialism in its existing forms ignored the spiritual needs of mankind and must be tempered with Christianity. Tracts were written to expose the sweated industries, the consequences of unrestrained competition, and the evils following the enclosure system; but, more concretely, Christian socialism fostered co-operative workshops and distributive societies based on those of the Rochdale pioneers, organised a working-man's college and set up elementary classes for education, and supported the trade-union movement's right to organise and bargain for its members.

The traditions of Christian socialism have been carried on by the Fabian Society, by adherents of Guild Socialism, and by individuals who reject Marx's teaching of revolutionary change, and seek to bring it about by the methods of action through political parties, education, and encouragement of the unions. They believe that Christ's teachings can only be fully realised in a new society since Christianity implies social responsibility, and material factors are admitted to have an important bearing on the ability to lead a truly religious life. In the U.S.A. the eminent theologians Paul Tillich and Reinhold Niebuhr support these views. The factory-padre in Britain and the Catholic worker-priests of France bear evidence to the continuing influence of the early movement. In England the Christian Socialist Movement (CSM) was revived in 1960 by the coming together of organisations like the Socialist Christian League and the Society for Socialist Clergy and Ministers. *See also* **Fabian Society, Guild Socialism.**

Church of England. There is some evidence of possible continuity with the Christianity of Roman Britain, but in the main the Church derives from the fusion of the ancient Celtic church with the missionary church of St. Augustine, who founded the See of Canterbury in A.D. 597. To archbishop Theodore in 673 is ascribed its organisation in dioceses with settled boundaries, and in parishes. St. Augustine's church was in communion with Rome from the first, but the Church of England was not brought within papal jurisdiction until after the Norman conquest, and was at no time under the complete domination of Rome. It remains the Catholic Church of England without break of continuity, but during the Reformation the royal supremacy was accepted and that of the pope repudiated. It is the Established Church (*i.e.*, the official church of the realm), crowns the sovereign, and its archbishops and bishops in the House of Lords can act as a kind of "conscience of the state" at every stage of legislation. The policy of religious toleration has been accepted since the 16th cent. The Church is organised in two ecclesiastical provinces (Canterbury and York) and 43 dioceses. Its form of worship is embodied in the Book of Common Prayer, which was compiled in 1549.

The **Anglican Communion** comprises the churches in all parts of the world which are in communion with the Church of England. All the bishops of the Anglican Communion meet every ten years in the Lambeth Conference (first held in 1867), over which the Archbishop of Canterbury by custom presides as *primus inter pares*. Observers and laymen were to be admitted to the 1968 Conference.

Church of Scotland, the established national church of Scotland, presbyterian in constitution, and governed by a hierarchy of courts—the kirk-sessions, the presbyteries, the synods, and the General Assembly. *See* **Presbyterianism.**

Clairvoyance. *See* **Telepathy.**

Communism, ideally refers to the type of society in which all property belongs to the community and social life is based on the principle "from each according to his ability, to each according to his needs." Since no such society as yet exists, the word in practice refers to the Communist Party's attempt to achieve such a society by initially overthrowing the capitalist system and establishing a dictatorship of the proletariat. The modern movement is based on Marxism as further developed by Lenin who applied Marx's analysis to the new conditions which had arisen in 20th cent. capitalist society. Noting the large trusts and combines which (according to the Marxian "theory of concentration") with their large concentrations of capital were ousting the small producers of an earlier stage, Lenin concluded that the state

(representing the ruling class) and these large capital interests were collaborating in imperialist policies which would inevitably lead to recurrent wars; that the skilled worker would become more important and, receiving higher wages, would betray the proletariat by moving to the right; and that the poorer workers would continue to support revolutionary socialism. Communists believe that their first task is the establishment of socialism under which there remain class distinctions, private property to some extent, and differences between manual and brain workers. The state is regulated on the basis "from each according to his ability, to each according to his work." In time this gives place to communism as described above and the state will wither away. Marxism–Leninism develops continuously with practice since failure to apply its basic principles to changed circumstances and times would result in errors of dogmatism. Two fundamental principles of communism are (1) peaceful co-existence between countries of different social systems, and (2) the class struggle between oppressed and oppressing classes and between oppressed and oppressor nations. China, for example, holds that it is a mistake to lay one-sided stress on peaceful transition towards socialism otherwise the revolutionary will of the proletariat becomes passive and unprepared politically and organisationally for the tasks ahead. *See also* **Trotskyism.**

Confessional Church, Lutherans in Germany who, led by Pastor Niemöller (b. 1892), opposed those teachings of the Nazi regime which they found incompatible with Christianity.

Confucianism. Confucius (Latinised form of K'ung-Fu-tzu) was born in 551 B.C. in the feudal state of Lu in modern Shantung province. He was thus a contemporary of Buddha, although nobody could have been more dissimilar. Where Buddha was metaphysical in his thought, Confucius was practical; Buddha was original, Confucius had hardly an original idea in his head; Buddha wanted to convert individuals to an other-worldly philosophy, Confucius wanted to reform the feudal governments of his time, believing that in this way their subjects would be made happier. Other religions have, in their time, been revolutionary; Confucius was a conservative who wanted to bring back a golden age from the past. The only respect in which Confucius agreed with the Buddha was that neither was particularly interested in the supernatural, and God or gods played little part in their religions.

Much of his time was spent in going from the court of one feudal lord to another trying to impress them by his example. For he suffered from the curious belief that the example set by the ruler influences his subjects. He made much of etiquette, trembling and speaking in low tones before princes, at ease and polite with his equals, and behaving with "lofty courtesy" to his inferiors. Promoting the idea of "the golden mean," he was not impressed by heroic deeds or unusual people, and was greatly displeased when he heard that a truthful son had reported that his father had stolen a sheep: "Those who are upright," he said, "are different from this; the father conceals the misconduct of the son, and the son conceals the misconduct of the father." One feels that Confucius would have felt not at all out of place in an English public school. Virtue brings its own reward in this world, ceremonial is important, politeness when universal would reduce jealousy and quarrels; "reverence the spirits but keep them far off." Destiny decides to what class a man shall belong, and as destiny is but another name for Nature prayer is unnecessary, for once having received his destiny, a man can demand and obtain from Nature what he chooses—his own will determines all things.

Although not very successful in his lifetime so far as the rulers were concerned, Confucius found numerous disciples before his death at the age of 70 who collected his teachings which are found, together with those of his later follower Mencius (372–289 B.C.), in the *Wu Ching* (five classics), and the *Shih Shu* (four books) which contain the Analects, The Great Learning, The Doctrine of the Mean, and the Book of Mencius. In time Confucianism became with Taoism and Buddhism one of the main religions in China. Unlike Buddhism it had little influence elsewhere.

Congregationalists, the oldest sect of Nonconformists who hold that each church should be independent of external ecclesiastical authority. They took their origin from the Brownists of Elizabeth's days. Robert Browne (*c.* 1550–*c.* 1633), an Anglican clergyman, who had come to reject bishops, was forced with his followers to seek refuge, first in Holland and then in Scotland where he was imprisoned by the Kirk. In later life he changed his views and is disowned by Congregationalists because of his reversion to Anglicanism. His former views were spread by Henry Barrow and John Greenwood who, under an Act passed in 1592 "for the punishment of persons obstinately refusing to come to church" (and largely designed for the suppression of this sect), were hanged at Tyburn. They had preached (*a*) that the only head of the church is Jesus Christ; (*b*) that, contrary to Elizabethan doctrine, the church had no relationship to the state; (*c*) that the only statute-book was the Bible whereas the Articles of Religion and the Common Prayer were mere Acts of Parliament; (*d*) that each congregation of believers was independent and had the power of choosing its own ministers. The body fled once more to Holland and were among the Pilgrims who set sail in the *Mayflower* for America in 1620 whilst those who remained were joined by Puritans fleeing from Charles I. They became free once more to live in England under the Commonwealth only to be repressed again under Charles II. Finally full liberty of worship was granted under William III. In 1833 the Congregational Union of England and Wales was formed which has no legislative power. It has issued a Declaration of Faith by which no minster is bound; he is responsible to his own church and to nobody else. The sect is widespread both in Britain and the U.S.A. where it is held in special honour because of its connection with the Pilgrim Fathers.

Conservatism. The name "Conservative" came into general use after 1834 in place of the older name of "Tory," although "Tory democracy" is now widely used to describe Conservative social reform policy. Originally the party of the aristocracy and landed gentry, Conservatism has been supported from the end of the 19th cent. by the large business interests, and more recently by lower-income groups in the population. Although originally based upon the teachings of Burke and Disraeli, Conservative doctrine has been considerably modified, especially since 1945 after defeat by the socialists. The Party's industrial policy seeks to reconcile the need for central direction with encouragement of individual enterprise, best described perhaps as "welfare capitalism." The Conservatives increased their parliamentary strength in three successive general elections from 1951–59, but were defeated by Labour in 1964. On the continent, Conservatism has generally been identified with fear of social progress, exaggerated respect for authority, and nationalism; such parties have more often than not been extremely reactionary and anti-democratic. *See also* **Section C, Part I.**

Coptic Church, the sect of Egyptian Christians who, holding "Monophysite" opinions (*i.e.*, refusing to grant the two natures, God and Man, of Christ), were declared heretical by the Council of Chalcedon in 451. They practise circumcision and have dietary laws. Their language is a direct descendant of ancient Egyptian. Like the Armenians, they are regarded as a heretical branch of Eastern Christianity. Their religious head is the patriarch of Alexandria.

Cynics, a school of philosophy founded in the time of Alexander the Great by Diogenes. Choosing to live like a dog by rejecting all conventions of religion, manners, or decency, and allegedly living in a tub, Diogenes unwittingly brought on his school the title "Cynic," meaning not "cynical," as the word is understood today, but "canine." His teacher, Antisthenes, who had been a disciple of Socrates, decided, after the latter's death, that all philosophy was useless quibbling and man's sole aim should be simple goodness. He believed in a return to

nature, despised luxury, wanted no government, no private property, and associated with working men and slaves. Far from being cynics in the modern sense, Diogenes and Antisthenes were virtuous anarchists rather like old Tolstoy (except that in the practice of their beliefs they were more consistent).

Darwinism. *See* **Section F, Part II.** *See also* **Vitalism.**

Deism. *See* **God and Man.**

Demonism, Demons, and the Devil. Demons are ethereal beings of various degrees of significance and power which are believed to be implicated in men's good, but especially evil, fortune. They are common to most cultures. From the anthropological point of view the demon arose as a widespread concept in the following ways: (1) as a psychological projection into the outer world of man's own good or evil emotions and thoughts; (2) as a survival of primitive animism (*q.v.*), thus spirits are believed to haunt places, trees, stones, and other natural objects; (3) when by warlike invasion the gods of the vanquished become the devils of the conquerors (as when the Jews occupied Canaan); (4) as a primitive belief that spirits of the dead continue after death to hover near their former habitation, and not always entirely welcome to the living; (5) the conception of a supreme source of evil (the Devil or Satan) which took shape among the Jews during their sojourn in Babylon under the influence of Zoroastrianism (*q.v.*), a religion in which the struggle between the two spirits, Good and Evil, reached its height in the imagination of the ancient world. The Satan of the Old Testament was first regarded as one of God's servants (in the Book of Job he goes up and down the earth to see whether God's commands are obeyed), but when the Jews returned from their captivity he had become identified with Ahriman, the spirit of evil, who was in continual conflict with Ahura Mazda, the spirit of good. As Dr. Margaret Murray has pointed out, the primitive mind ascribed both good and evil to one power alone; the division into God and the Devil, priest and witch, belongs to a higher stage of civilisation. *See also* **Witchcraft, Magic.**

Determinism and Free-will. The question of whether man is, or is not, free to mould his own destiny is one which has exercised the minds of philosophers since Greek mythology conceived of the Fates as weaving a web of destiny from which no man can free himself. Socrates emphasised that man could through knowledge influence his destiny whilst ignorance made him the plaything of fate; Plato went further in pointing out that man can, and does, defeat the purposes of the universe and its divine Creator. It is our duty to live a good life, but we can live a foolish and wicked one if we choose. Aristotle wrote " Virtue is a disposition or habit involving deliberate purpose or choice." If this were not so morality would be a sham.

The Problem for Theology. The last of the great philosophers of antiquity and one of the great influences in moulding Catholic theology was Plotinus (*c.* 204–270). Soul, he taught, is free, but once enmeshed in the body loses its freedom in the life of sense. Nevertheless, man is free to turn away from sensuality and towards God who is perfect freedom; for even when incarnated in matter the soul does not entirely lose the ability to rescue itself. This conception was carried over into the beliefs of the Early Christian Apologists because it appeared to be in line with the teaching of Jesus that He had come to save man from sin. Sin implies guilt, and guilt implies the freedom to act otherwise; furthermore an all-good God cannot be responsible for the sin in the world which must be man's responsibility and this again implies freedom. Pelagius (*c.* 355–*c.* 425), a Welsh priest, not only believed in freewill but, questioning the doctrine of original sin, said that when men act righteously it is through their own moral effort, and God rewards them for their virtues in heaven. This belief became fairly widespread and was declared a heresy by the Church, being attacked notably by St. Augustine (354–430), a contemporary of Pelagius, who believed in predestination—that, since the sin of Adam, God had chosen who in all future history would be saved and who damned. This represents one tradition in Christianity: the determinism which leads to Calvinism (*q.v.*). St. Thomas Aquinas (1227–74), the greatest figure of scholasticism and one of the principal saints in the Roman Catholic Church, compromised between the two positions in the sense that, believing man to be free, he yet held that Adam's sin was transmitted to all mankind and only divine grace can bring salvation. But even when God wishes to bestow this salvation, the human will must cooperate. God foresees that some will not accept the offer of grace and predestines them to eternal punishment.

The Problem for Philosophy. With the Renaissance, thinkers began to free themselves from the domination of the Church and to study the world objectively and freely without preconceptions. But the more man turned to science, the more he discovered that the world was ruled by apparently inexorable laws and, since the scientist must believe that every event has a cause, he was led back to determinism. Man as part of the universe was subject to law too and all that existed was a vast machine. Francis Bacon (1561–1626) separated the fields of religion and science but left man subject completely to the will of God. Thomas Hobbes (1588–1679) was a rigid determinist and materialist although, having had trouble with the church in France whence, as a royalist, he had fled, he took care to announce that the Christian God is the Prime Mover.

Modern philosophy begins with René Descartes (1596–1650), a Frenchman who tried to reconcile the mechanical scientific universe of his time with the spiritual need for freedom. He did this by separating completely mind and body; the former, he said, is free, the latter completely determined. But, by admitting that the will can produce states of body, he was left with the problem of how this could happen—a problem which the so-called Occasionists solved to their own satisfaction by stating that the will is free and God so arranges the universe that what a person wills happens. Baruch Spinoza (1632–77), a Dutch Jew whose independence of thought had led to his excommunication from the Amsterdam Synagogue in 1656, was a complete determinist. He asserted that God and Nature are one, everything that happens is a manifestation of God's inscrutable nature, and it is logically impossible that things could be other than they are. Thus both Hobbes and Spinoza were determinists for entirely opposed reasons. The former as a materialist, the latter because he believed in the absolute perfection and universality of God. Yet the great religious mystic and mathematician Blaise Pascal (1623–62) held that, no matter what reason and cold logic may indicate, we *know* from direct religious experience that we are free. John Calvin (1509–64) and Martin Luther (1483–1546) were both determinists. *See* **Calvinism, Lutheranism.**

To the more practical British philosophers, John Locke (1632–1704) and David Hume (1711–76), free-will was related to personality. Locke believed that God had implanted in each individual certain desires and these determine the will; the desires are already there, but we use our will to satisfy them. Hume argued that a man's behaviour is the necessary result of his character and if he had a different character he would act otherwise. Accordingly, when a man's actions arise from his own nature and desires he is free. He is not free when external events compel him to act otherwise (*e.g.*, if he strikes another because his own nature is such he is free as he is not if he is compelled to do so against his desire). Leibnitz (1646–1716), although as a German metaphysical philosopher holding very different general views, said much the same thing—that choice is simply selecting the desire that is strongest. But most of the 18th cent. from Voltaire onwards, with the great exceptions of Rousseau and the later German philosophers Kant, Fichte, Schopenhauer, and Hegel, who were initially influenced by him,

accepted determinism. Rousseau (1712–78) began to stem the tide by his declaration that man is a free soul striving to remain free and only prevented from being so by society and the cold science which stifles his feeling heart. Once again the will became important as Kant (1724–1804) asserted that belief in freedom is a moral necessity although it cannot be proved by reason; the moral nature of man shows that there is a "transcendental" world beyond the senses where freedom applies. Fichte and Schelling found freedom in the Absolute ego or God of whom each individual was part and thus also free. Hegel (1770–1831) saw the whole universe as evolving towards self-awareness and freedom in man although this could only be fully realised in a society that makes for freedom. Even God himself only attains full consciousness and self-realisation through the minds of such individuals as are free. This is the goal of the dialectical process. (*See* **Dialectical Materialism.**)

The Scientist's View. For the scientist the law of cause and effect is a useful hypothesis since, by and large, it is necessary for him to assume that all events are caused. Nevertheless the modern tendency is to think in terms of statistical probability rather than relentless mechanistic causality, and, although the free-will problem does not concern the scientist as such, it is clear that freedom and determinism (assuming the terms to have any meaning at all) are not necessarily opposed. In sociology, for example, we *know* that certain actions will produce certain results upon the behaviour of people in general, *e.g.*, that raising the bank rate will discourage business expansion. But this does not mean that Mr. Brown who decides in the circumstances not to add a new wing to his factory is not using his free-will. Even in the case of atoms, as Dr. Bronowski has pointed out, the observed results of allowing gas under pressure in a cylinder to rush out occur because most of the atoms are "obeying" the scientific "law" relating to such situations. But this does not mean that some atoms are not busy rushing across the stream or even against it—they are, but the general tendency is outwards and that is what we note. Lastly, the modern philosophical school of Logical Analysis would probably ask, not whether Free-will or Determinism is the true belief, but whether the question has any meaning. For what scientific experiment could we set up to prove one or the other true? The reader will note that some of the philosophers mentioned above are using the words to mean quite different concepts.

Dialectical Materialism, the combination of Hegel's dialectic method with a materialist philosophy produced by Karl Marx (1818–83) and his friend Friedrich Engels (1820–95). It is the philosophical basis of **Marxism** (*q.v.*) and **Communism** (*q.v.*). "Dialectic" to the ancient Greek philosophers meant a kind of dialogue or conversation, as used particularly by Socrates, in which philosophical disputes were resolved by a series of successive contradictions: a thesis is put forward and the opposing side holds its contradiction or antithesis until in the course of argument a synthesis is reached in which the conflicting ideas are resolved.

From Thesis through Antithesis to Synthesis. Hegel in the 19th cent. put forward the view that this process applies to the course of nature and history as they strive towards the perfect state. But to him, as to the Greeks, the conflict was in the field of ideas. The "universal reason" behind events works through the ideas held by a particular society until they are challenged by those of another which supersedes them and in turn, usually by war, becomes the agent of universal reason until the arrival of a new challenger. Hegel therefore regarded war as an instrument of progress and his Prussian compatriots found no difficulty in identifying their own state as the new agent of progress by universal conquest. Feuerbach, Lassalle, and other early socialists were impressed by some of Hegel's ideas: *e.g.*, that societies evolved (with the assumption that finally their own ideal society would be achieved) and that truth, morals, and concepts were relative so that a type of society that was "good" at one time was not necessarily so at another. But Marx and Engels in effect turned Hegel upside-down, accepted his dialectic but rejected his belief that ideas were the motive force. On the contrary, they said, ideas are determined by social and economic change as a result of materialistic forces. (*See* **Calvinism**, where it is pointed out that the Marxist view is not that Calvin changed men's economic ideas but rather that a developing capitalism unconsciously changed his.) The historical materialism of Marxism purports to show that the inexorable dialectic determines that feudalism is displaced by capitalism and capitalism by creating a proletariat (its antithesis) inevitably leads to socialism and a classless society. The state, as a tool of the dominant class, withers away. Dialectical materialism is applied in all spheres. As a philosophy there is little to be said for it save that it has shown us the close dependence of man's thoughts upon current material and social conditions. But as a battle-cry or a rationalisation of Marxism it wields immense power over the minds of men. *See* **Marxism.**

Diggers, one of the many sects which flourished under the Commonwealth (others were the Muggletonians, the Levellers, the Millenarians, and the Fifth Monarchy Men), so-called because they attempted to dig (*i.e.* cultivate) untilled land. Gerrard Winstanley, a profoundly religious man, and leader of the Diggers, believed in the economic and social equality of man and castigated the clergy for upholding the class structure of society. In his book *The True Leveller's Standard Advanced* (1649) he wrote: "Every day poor people are forced to work for fourpence a day, though corn is dear. And yet the tithing priest stops their mouth and tells them that 'inward satisfaction of mind' was meant by the declaration 'the poor shall inherit the earth'. I tell you, the Scripture is to be really and materially fulfilled. You jeer at the name 'Leveller'; I tell you Jesus Christ is the Head Leveller."

Disciples of Christ, a Protestant religious group founded in the United States early in the 19th century by Thomas Campbell, a Scot, his son Alexander, and Barton Warren Stone who had broken away from the Presbyterian church. The basis for faith and conduct is the Bible itself, each individual interpreting it for himself. The group has always had a liberal reputation and stands for racial equality and Christian unity. The Disciples of Christ Church is particularly strong in the central and western states of America.

Docetists, a Gnostic sect (*q.v.*) during the early centuries of Christianity who believed that, since it was unworthy that the Son of God should have died a humiliating death on the cross, the entity that was crucified was a mere phantom. Mohammed, who believed in Jesus as a prophet but not as divine, adopted these views. The heretical Albigenses were influenced by Docetism, Gnosticism, and Manichaeism (*qq.v.*).

Doukhobors, a religious sect of Russian origin, founded by a Prussian sergeant at Kharkov in the middle of the 18th cent., and now mainly settled in Canada. Like many other sects they belong to that type of Christianity which seeks direct communication with God and such bodies tend to have certain traits in common such as belief in the "inner light," opposition to war and authority in general, and often ecstasies which show themselves in physical ways such as shaking, speaking in strange tongues (glossolalia), and other forms of what to the unbeliever seem mass hysteria. Liturgy, ritual, or ceremony is non-existent. The Doukhobors were persecuted in Tsarist Russia, but in 1898 Tolstoy used his influence to have them removed to Canada where the government granted them uninhabited land in what is now Saskatchewan and seven or eight thousand settled down in peace which they enjoyed for many years. Recently, however, their practices have caused difficulties once more; for even the most tolerant government which is prepared to accept pacifism, total dependence on communally-owned agriculture, refusal to engage in commerce, non-payment of taxes, rejection of the marriage ceremony and separation "when love ceases"

finds it difficult to tolerate. ... civilisation advances ever closer to Doukhobor communities, their proneness to "put off these troublesome disguises which we wear"—*i.e.*, to walk about naked in the communities of their more orthodox neighbours. What the future of the Doukhobors in their various sects (for even they have their differences) will be it is impossible to say, but it is difficult to believe that these simple people can long resist the pressure of modern civilisation.

Druidism, the religion of Celtic Britain and Gaul of which Druids were the priesthood. They were finally wiped out by the Roman general Suetonius Paulinus about A.D. 58 in their last stronghold, the island of Anglesey. There are two sources of our present beliefs in Druidism: (1) the brief and factual records of the Romans, notably Pliny and Julius Caesar, which tell us that they worshipped in sacred oak groves and presumably practised a religion doing reverence to the powers of nature which must have had its roots in early stone age times and had many cruel rites *e.g.*, human sacrifice; (2) the beliefs put forward by William Stukeley, an amateur antiquarian who from 1718 did valuable work by his studies of the stone circles at Stonehenge and Avebury. However, influenced by the Romantic movement, he later put forward the most extravagant theories which unfortunately are those popularly accepted by those without archaelogical knowledge today. Stonehenge and Avebury were depicted as the temples of the "white-haired Druid bard sublime" and an attempt was made to tie up Druidism with early Christianity, above all with the concept of the Trinity. In fact, these circles have no connection with the Druids. They may have made ceremonial use of them but recent evidence suggests that the megalithic stones at Stonehenge (L109) belong to a Bronze Age culture (1860–1560 B.C.). Nor have Druidism and Christianity any relationship. Almost nothing is known of the religion. Yet such were its romantic associations that, even today, one hears of "Druidic" ceremonies practised at the appropriate time of year on Primrose Hill in the heart of London (though whether seriously or with tongue in cheek one does not know).

Dualism, any philosophical or theological theory which implies that the universe has a double nature, notably Plato's distinction between appearance and reality, soul and body, ideas and material objects, reason and the evidence of the senses, which infers that behind the world as we perceive it there lies an "ideal" world which is more "real" than that of mere appearance. In religions such as Zoroastrianism or the Gnostic and Manichaeism heresies (*qq.v.*), it was believed that the universe was ruled by good and evil "principles"—in effect that there was a good God and a bad one. In psychology, dualism refers to the philosophical theories which believe mind and body to be separate entities. The opposite of dualism is monism which asserts the essential unity of the substance of the universe.

E

Ecumenism, a world movement which springs from the Christian belief that all men are brothers and that the Christian Church should be re-structured to give reality to the belief. Christ's church exists not to serve its own members, but for the service of the whole world. Some see the answer in a united church of a federal type (unity in diversity), others in an organic structure with one set of rules. The period since the convening of the Second Vatican Council by Pope John has been one of fervent discussion among Christian theologians with the aim of promoting Christian unity. *See* **World Council of Churches**.

Education. Education was no great problem to primitive man, but as societies became more complex people began to ask themselves such questions as: *What* should young people be taught? *How* should they be taught? Should the aim of their education be to bring out their individual qualities or rather to make them good servants of the state?

The first teachers were priests who knew most about the traditions, customs, and lore of their societies and thus the first schools were in religious meeting places. This was notably true of the Jews who learned from the rabbis in the synagogue, and throughout the Middle Ages in Christendom as will be seen later.

The Greeks. We begin, as always, with the Greeks whose city-states, based on slavery, educated men (not women) for the sort of life described in Plato's *Dialogues*—the leisured life of gentlemen arguing the problems of the universe at their banquets or in the market-place. This made it necessary to learn debate and oratory (or rhetoric) especially for those who proposed to take up politics. The Sophist philosophy taught the need to build up convincing arguments in a persuasive manner, to learn the rules of logic and master the laws and customs of the Athenians, and to know the literature of the past so that illustrations might be drawn from it. These strolling philosophers who taught for a fee were individualists showing the student how to advance himself at all costs within his community.

Socrates had a more ethical approach, believing that education was good in itself, made a man happier and a better citizen, and emphasised his position as a member of a group. His method of teaching, the dialectic or "Socratic" method, involved argument and discussion rather than overwhelming others by rhetoric and is briefly mentioned under **Dialectical Materialism** (*q.v.*). Today this method is increasingly used in adult education where a lecture is followed by a period of discussion in which both lecturer and audience participate; for psychologists have shown that people accept ideas more readily when conviction arises through their own arguments than when they are passively thrust down their throats.

Socrates' pupil Plato produced in his book *The Republic* one of the first comprehensive systems of education and vocational selection. Believing that men are of different and unequal abilities he considered that they should be put into social classes corresponding to these differences, and suggested the following method: (1) For the first 18 years of a boy's life he should be taught gymnastics and sports, playing and singing music, reading and writing, a knowledge of literature, and if he passed this course sent on to the next stage; those who failed were to become tradesmen and merchants. (2) From 18–20 those successful in the first course were to be given two years of cadet training, the ones thought incapable of further education being placed in the military class as soldiers. (3) The remainder, who were to become the leaders of society, proceeded with advanced studies in philosophy, mathematics, science, and art. Such education was to be a state concern, state supported and controlled, selecting men and training them for service in the state according to their abilities.

Plato's pupil Aristotle even suggested that the state should determine shortly after birth which children should be allowed to live and destroy the physically or mentally handicapped; that marriage should be state-controlled to ensure desirable offspring. However, in their time the leisured and individualistic Sophists held the field and few accepted the educational views of Plato or his pupil.

Rome. The Romans were not philosophers and most of their culture came from Greece. Administration was their chief aptitude and Quintillian (A.D. *c.* 35–*c.* 95) based his higher education on the earlier classical tuition in public speaking, but he is important for emphasising the training of character and for his humanistic approach to the method of teaching that caused his *Institutio oratoria* to be influential for centuries later—indeed one might almost say up to the time of the great Dr. Arnold of Rugby. Education, he believed, should begin early but one must "take care that the child not old enough to love his studies does not come to hate them" by premature forcing; studies must be made pleasant and interesting and students encouraged by praise rather than discouraged when they sometimes fail; play is to be approved of as a sign of a lively disposition and because gloomy, depressed children

are not likely to be good students: corporal punishment should never be used because "it is an insult as you will realise if you imagine it yourself." The world became interested not in *what* he taught but *how* he taught it; he was the pioneer of humanistic education and character-training from Vittorino da Feltre (1378–1446) of Mantua, through Milton and Pope who commended his works, to the modern educationists who have studied their pupils as well as their books.

The Middle Ages: The Religious View. With the development of Christianity education once more became a religious problem. The earliest converts had to be taught Christian doctrine and were given instruction in "catechumenal" schools before admission to the group, but as the religion came increasingly into contact with other religions or heresies a more serious training was necessary, and from these newer "catechetical" schools, where the method used was the catechism (*i.e.*, question and answer as known to all Presbyterian children today), the Apologists arose among whom were Clement of Alexandria and the great Origen. From this time education became an instrument of the church and in 529 the Emperor Justinian ordered all pagan schools to be closed.

As typical of the best in mediaeval education whilst the lamp of civilisation burned low during the Dark Ages, after the fall of Roman power, and survived only in the monasteries, we may mention St. Benedict (*c.* 480–*c.* 547) of Monte Cassino. There, in southern Italy, a rule was established which became a part of monastic life in general. Monastic schools were originally intended for the training of would-be monks, but later others were admitted who simply wanted some education; thus two types of school developed one for the *interni* and the other for *externi* or external pupils. Originally studies were merely reading in order to study the Bible, writing to copy the sacred books, and sufficient calculation to be able to work out the advent of holy days or festivals. But by the end of the 6th cent. the "seven liberal arts" (grammar, rhetoric, dialectic, arithmetic, geometry, music, and astronomy) were added.

The Renaissance. The close of the Middle Ages saw the development of two types of secular school. One came with the rise of the new merchant class and the skilled trader whose "guilds" or early trade unions established schools to train young men for their trades but ultimately gave rise to burgher or town schools; the other was the court school founded and supported by the wealthy rulers of the Italian cities—Vittorino da Feltre (mentioned above) presided over the most famous at Mantua.

These Renaissance developments are paralleled in northern Europe by the Protestant reformers who, having with Martin Luther held that everyone should know how to read his Bible in order to interpret it in his own way, were logically committed to popular education, compulsory and universal. In theory this was intended for biblical study, but writing, arithmetic, and other elementary subjects were taught and Luther said that, even if heaven and hell did not exist, education was important. Universal education is a Protestant conception.

Views of Philosophers. From this period onwards people were free to put forward any ideas about education, foolish or otherwise, and to create their own types of school. Of English philosophers who theorised about, but did not practise, education we may mention the rationalist Francis Bacon (1561–1626) who saw learning as the dissipation of all prejudices and the collection of concrete facts; the materialist and totalitarian Hobbes (1588–1679) who, as a royalist, believed that the right to determine the kind of education fit for his subjects is one of the absolute rights of the sovereign power or ruler; the gentlemanly Locke (1632–1704) whose ideal was a sound mind in a sound body to be attained by hard physical exercise, wide experience of the world, and enough knowledge to meet the requirements of the pupil's environment. The end result would be one able to get on with his fellows, pious but wise in the ways of the world, independent and able to look after himself, informed but reticent about his knowledge. Classics and religious study were not to be carried to excess, since Locke held that these subjects had been overrated in the past. Locke's pupil was the well-to-do, civilised young man of the 17th cent. who knew how to behave in society.

Jean-Jacques Rousseau (1712–78) (*q.v.*), a forerunner of the Romantic movement, which despised society and its institutions, put emotion at a higher level than reason. His book *Emile* describes the education of a boy which is natural and spontaneous. Society, he holds, warps the growing mind and therefore the child should be protected from its influences until his development in accordance with his own nature is so complete that he cannot be harmed by it. During the first 4 years the body should be developed by physical training; from 5 to 12 the child would live in a state of nature such that he could develop his powers of observation and his senses; from 13 books would be used and intellectual training introduced, although only in line with the child's own interests, and he would be given instruction only as he came to ask for it. Moral training and contact with his fellows to learn the principles of sympathy, kindness, and helpfulness to mankind would be given between 15 and 20. Girls, however, should be educated to serve men in a spirit of modesty and restraint. His own five children he deposited in a foundling hospital.

Summary. Broadly speaking, then, there have been four main attitudes to education: (1) religious, with a view to a life beyond death; (2) state-controlled education, with a view to uniform subservience to authority; (3) "gentlemanly" education, with a view to social graces and easy congress in company; (4) the "child-centred" education, which attempts to follow the pupil's inner nature. It is unnecessary to mention the ordinary method of attempting to instil facts without any considerable degree of co-operation between pupil and teacher in order that the former may, with or without interest, follow some occupation in adult life; for this the philosophers did not consider. Today there remain the two fundamental principles: education for the advantage of the state and its ideology or education for individual development and freedom.

Four educationists of the modern period who have influenced us in the direction of freedom were Johann Pestalozzi of Switzerland (1746–1827) who, by trying to understand children, taught the "natural, progressive, and harmonious development of all the powers and capacities of the human being"; Friedrich Froebel (1782–1852) of Germany, the founder of the Kindergarten who, like Pestalozzi, was influenced by Rousseau but realised the need to combine complete personal development with social adjustment; Maria Montessori (1869–1952) whose free methods have revolutionised infant teaching; John Dewey (1859–1952) who held that the best interests of the group are served when the individual develops his own particular talents and nature.

Eleatics, the philosophers of Elea in ancient Greece who, at the time when Heraclitus (*c.* 535–475 B.C.) was teaching that change is all that exists and nothing is permanent, were asserting that change is an illusion. Of the three leaders of this school, Xenophanes asserted that the universe was a solid immovable mass forever the same; Parmenides explained away change as an inconceivable process, its appearance being due to the fact that what we see is unreal; and Zeno (the best-known today) illustrated the same thesis with his famous argument of the arrow which, at any given moment of its flight, must be where it is since it cannot be where it is not. But if it is where it is, it cannot move; this is based, of course, on the delusion that motion is discontinuous. The Eleatics were contemporaries of Socrates.

Empiricism. While not a single school of philosophy, empiricism is an approach to knowledge which holds that if a man wants to know what the universe is like the only correct way to do so is to go and look for himself, to collect facts which come to him through his senses. It is, in essence, the method of science as contrasted

with rationalism (*q.v.*) which in philosophy implies that thinking or reasoning without necessarily referring to external observations can arrive at truth. Empiricism is typically an English attitude, for among the greatest empirical philosophers were John Locke, George Berkeley, and David Hume. *See* Rationalism.

Epicureanism. The two great schools of the Hellenistic period (*i.e.* the late Greek period beginning with the empire of Alexander the Great) were the Stoics and Epicureans, the former founded by Zeno of Citium (*not* to be confused with Zeno the Eleatic) (*q.v.*), the latter by Epicurus, born in Samos in 342 B.C. Both schools settled in Athens, where Epicurus taught that "pleasure is the beginning and end of a happy life." However, he was no sensualist and emphasised the importance of moderation in all things because excesses would lead to pain instead of pleasure and the best of all pleasures were mental ones. Pleasures could be active or passive but the former contain an element of pain since they are the process of satisfying desires not yet satiated. The latter involving the absence of desire are the more pleasant. In fact, Epicurus in his personal life was more stoical than many Stoics and wrote "when I live on bread and water I spit on luxurious pleasures." He disapproved of sexual enjoyment and thought friendship one of the highest of all joys. A materialist who accepted the atomic theory of Democritus, he was not a determinist, and if he did not disbelieve in the gods he regarded religion and the fear of death as the two primary sources of unhappiness.

Epiphenomenalism. *See* **Mind and Body.**

Erastianism, the theory that the state has the right to decide the religion of its members, wrongly attributed to Erastus of Switzerland (1524–83) who was believed to have held this doctrine. The term has usually been made use of in a derogatory sense—*e.g.*, by the Scottish churches which held that the "call" of the congregation was the only way to elect ministers at a time when, about the turn of the 17th and 18th cent., they felt that Episcopalianism was being foisted on them. "Episcopalianism" (*i.e.* Anglicanism) with its state church, ecclesiastical hierarchy, and system of livings presented by patrons was to them "Erastian" in addition to its other "unscriptural practices."

Essenes, a Jewish sect which, during the oppressive rule of Herod (d. 4 B.C.), set up monastic communities in the region of the Dead Sea. They refused to be bound by the scriptural interpretations of the Pharisees and adhered rigorously to the letter of Holy Writ, although with additions of their own which cause them by orthodox Jews today to be regarded as a break-away from Judaism. Among their practices and beliefs were purification through baptism, renunciation of sexual pleasures, scrupulous cleanliness, strict observance of the Mosaic law, communal possession, asceticism. Akin in spirit, although not necessarily identical with them, were the writers of Apocalyptic literature preaching that the evils of the present would shortly be terminated by a new supernatural order heralded by a Messiah who would reign over a restored Israel. The casting out of demons and spiritual healing formed part of these general beliefs which were in the air at that time. The sect has an importance far beyond its size or what has been known about it in the past since the discovery from 1947 onwards of the Dead Sea Scrolls (*See* **Section L**) of the Qumran community occupying a monastery in the same area as the Essenes and holding the same type of belief. These scrolls with their references to a "Teacher of Righteousness" preceding the Messiah have obvious relevance to the sources of early Christianity and have given rise to speculations as to whether Jesus might have been influenced by views which, like His own, were unacceptable to orthodox Jews but in line with those of the Dead Sea communities. At the very least they seem to show that early Christianity was not a sudden development but a gradual one which had its predecessors.

Ethical Church, a movement typical of 19th cent. rationalism which attempted to combine atheism (or at any rate the absence of any belief in a God which was inconsistent with reason or based on revelation) with the inculcation of moral principles. Prayers were not used and ordinarily the service consisted in the singing of edifying compositions interspersed with readings from poems or prose of a similar nature by great writers holding appropriate views. It terminated in a talk on an ethical or scientific theme. There is an Ethical Church in London and the South Place Institution where Moncure Conway preached from 1864 to 1897 still exists.

Ethnocentrism, the exaggerated tendency to think the characteristics of one's own group or race superior to those of any others.

Evangelicanism, the belief of those Protestant sects which hold that the essence of the Gospel consists in the doctrine of salvation by faith in the atoning death of Christ and not by good works or the sacraments; that worship should be "free" rather than liturgical through established forms; that ritual is unacceptable and superstitious. Evangelicals are Low Churchmen.

Evangelism, the preaching of the Gospel, emphasising the necessity for a new birth or conversion. The evangelistic fervour of John Wesley and George Whitefield (*see* Methodism) aroused the great missionary spirit of the late 18th and 19th cent. George Fox, founder of the Society of Friends (*q.v.*), was also an evangelist. Evangelists can be Low, High, or Middle Churchmen.

Existentialism, a highly subjective philosophy which many people connect with such names as Jean-Paul Sartre (b. 1905) or Albert Camus (1913–60) and assume to be a post-war movement associated with disillusion and a sordid view of life. However, existentialism stems from Sören Kierkegaard (1813–55), the Danish "religious writer"—his own description of himself—in such works as *Either/Or*, *Fear and Trembling*, and *Concluding Unscientific Postscript*. Between the two wars translations of Kierkegaard into German influenced Martin Heidegger's (b. 1889) great work *Being and Time* and the other great existentialist Karl Jaspers (b. 1883); it has strongly influenced modern Protestant theology notably in Karl Barth, Reinhold Niebuhr, and Paul Tillich and beyond that field Gabriel Marcel (b. 1887), the Spanish writer Unamuno (1864–1936) in his well-known *The Tragic Sense of Life*, and Martin Buber of Israel (b. 1878) in his *I and Thou*. We have it on Heidegger's authority that "Sartre is no philosopher" even if it is to his works that modern existentialists often turn.

Existentialism is extremely difficult for the non-metaphysically-minded to understand; it deals, not with the nature of the universe or what are ordinarily thought of as philosophical problems but describes an attitude to life or God held by the individual. Briefly, its main essentials are: (1) it distinguishes between *essence*, *i.e.*, that aspect of an entity which can be observed and known—and its *existence*—the fact of its having a place in a changing and dangerous world which is what really matters; (2) existence being basic, each self-aware individual can grasp his own existence on reflection in his own immediate experience of himself and his situation as a free being in the world; what he finds is not merely a knowing self but a self that fears, hopes, believes, wills, and is aware of its need to find a purpose, plan, and destiny in life; (3) but we cannot grasp our existence by thought alone; thus the fact "all men must die" relates to the essence of man but it is necessary to be involved, to draw the conclusion as a person that "I too must die" and experience its impact on our own individual existence; (4) because of the preceding, it is necessary to abandon our attitude of objectivity and theoretical detachment when faced by the problems relating to the ultimate purpose of our own life and the basis of our own conduct; life remains closed to those who take no part in it because it can have no significance; (5) it follows that the existentialist cannot be rationalist in his outlook for this is merely an escape into thought from the serious problems of existence; none of the important aspects of life—failure, evil, sin, folly—nor (in the view of Kierkegaard) even the existence of God or the truth of Christianity—can be proved by reason.

"God does not exist; He is eternal," was how he expressed it; (6) life is short and limited in space and time, therefore it is foolish to discuss in a leisurely fashion matters of life or death as if there were all eternity to argue them in. It is necessary to make a leap into the unknown, *e.g.*, accepting Christ (in the case of the Christian existentialist) by faith in the sense of giving and risking the self utterly. This means complete commitment, not a dependence on arguments as to whether certain historical events did, or did not, happen.

To summarise: existentialism of whatever type seems to the outsider to be an attitude to life concerning itself with the individual's ultimate problems (mine, not yours); to be anti-rationalist and anti-idealist (in the sense of being, as it seems to the believer, practical)—in effect it seems to say "life is too short to fool about with argument, you must dive in and become committed" to something. Sartre who calls himself an "atheist existentialist" is apparently committed to the belief that "hell is other people," but for most critics the main argument against existentialist philosophy is that it often rests on a highly specialised personal experience and, as such, is incommunicable.

Extra-sensory Perception. *See* Telepathy.

F

Fabian Society. In 1848 (the year of *The Communist Manifesto* by Marx and Engels) Europe was in revolt. In most countries the workers and intellectuals started bloody revolutions against the feudal ruling classes which were no less violently suppressed; hence on the continent socialism took on a Marxist tinge which to some extent it still retains. But at the same time England was undergoing a slow but non-violent transition in her political and industrial life which led the workers in general to look forward to progress through evolution. Marxism never became an important movement in England even though it took its origin here. There were many reasons for this; the agitation of the Chartists (*q.v.*); the writings of Mill, Ruskin, and Carlyle; the reforms of Robert Owen; the religious movement led by the Wesleys; the Co-operative societies; the Christian socialists. Furthermore legislation stimulated by these bodies had led to an extension of the franchise to include a considerable number of wage-earners, remedial measures to correct some of the worst abuses of the factory system, recognition of the trade unions, etc.

This was the background against which the Fabian Society was founded in 1884 with the conviction that social change could be brought about by gradual parliamentary means. (The name is derived from Quintus Fabius Maximus, the Roman general nicknamed "Cunctator," the delayer, who achieved his successes in defending Rome against Hannibal by refusing to give direct battle.) It was a movement of brilliant intellectuals, chief among whom were Sidney and Beatrice Webb, H. G. Wells, G. B. Shaw, Graham Wallas, Sidney Olivier, and Edward Pease. The Society itself was basically a research institution which furnished the intellectual information for social reform and supported all contributing to the gradual attainment by parliamentary means of socialism.

The Webbs's analysis of society emphasised that individualist enterprise in capitalism was a hang-over from early days and was bound to defeat itself since socialism is the inevitable accompaniment of modern industrialism; the necessary result of popular government is control of their economic system by the people themselves. Utopian schemes had been doomed to failure because they were based on the fallacy that society is static and that islands of utopias could be formed in the midst of an unchanging and antagonistic environment. On the contrary, it was pointed out, society develops: "The new becomes old, often before it is consciously regarded as new." Social reorganisation cannot usefully be hastened by violent means but only through methods consonant with this natural historical progression—gradual, peaceful, and democratic. The Fabians were convinced that men are rational enough to accept in their common interest developments which can be demonstrated as necessary; thus public opinion will come to see that socialisation of the land and industries is essential in the same way that they came to accept the already-existing acts in respect of housing, insurance, medical care, and conditions of work. Gradual "permeation" of the power groups—trade unions, political parties, managers, and enlightened employers—would speed the process.

The Society collaborated first in the formation of the Independent Labour Party and then with the more moderate Labour Party and the trade unions and Co-operative movement. But in general it disapproved of independent trade union action since change should come from the government and take political form. The class-war of Marx was rejected and so too was the idea of the exclusive role of the working class—reform must come from the enlightened co-operation of all classes—not from their opposition.

Faculty Psychology, a school of psychology, basically belonging to the early 19th cent., which sought to explain mental phenomena by referring them to the activity of certain agencies or faculties such as memory, imagination, will, etc., as if they were entities in their own right rather than merely general terms for various groups of mental phenomena. Its most extreme form was phrenology (*q.v.*) which found no less than thirty-seven so-called faculties.

Falangists. The Fascist Party of Spain founded in 1933 by José Antonio Primo de Rivera, son of the man who was dictator of the country from 1923 to 1930; he was shot by the Republicans. In 1937 the falangists who had shown unwelcome signs of social radicalism were merged with the other right-wing political groups to form the *Falange Española Tradicionalista y de las Juntas de Ofensive Nacional Sindicalistas* which replaced the Cortes (*i.e.* the Government) between 1939 and 1942 when the Cortes was reinstituted. The Falange is the only political party allowed in Spain. *See* Fascism.

Fascism. From the end of mediaeval times with the opening up of the world, the liberation of the mind and the release of business enterprise, a new spirit arose in Europe exemplified in such movements as the Renaissance, the Reformation, the struggle for democracy, the rise of capitalism, and the Industrial Revolution. With these movements there developed a certain tradition which, in spite of hindrances and disagreements or failures, was universally held both by right- and left-wing parties however strongly they might fail to agree on the best means of attaining what was felt to be a universal ideal. The hard core of this tradition involved: belief in reason and the possibility of human progress; the essential sanctity and dignity of human life; tolerance of widely different religious and political views; reliance on popular government and the responsibility of the rulers to the ruled; freedom of thought and criticism; the necessity of universal education; impartial justice and the rule of law; the desirability of universal peace. Fascism was the negation of every aspect of this tradition and took pride in being so. Emotion took the place of reason, the "immutable, beneficial, and fruitful inequality of classes" and the right of a self-constituted élite to rule them replaced universal suffrage because absolute authority "quick, sure, unanimous" led to action rather than talk. Contrary opinions are not allowed and justice is in the service of the state; war is desirable to advance the power of the state; and racial inequality made a dogma. Those who belong to the "wrong" religion, political party, or race are outside the law.

The attacks on liberalism and exaltation of the state derive largely from Hegel and his German followers; the mystical irrationalism from such 19th cent. philosophers as Schopenhauer, Nietzsche, and Bergson; from Sorel (*see* Syndicalism) came the idea of the "myth," and an image which would have the power to arouse the emotions of the masses and from Sorel also the rationale of violence and justification of force.

But these philosophical justifications of fascism do not explain why it arose at all and why it arose where it did—in Italy, Germany, and Spain. These countries had one thing in common—disillusionment. Germany had lost the 1914–18 war, Italy had been on the winning side but was resentful about her small gains, Spain had sunk to the level of a third-rate power, and people were becoming increasingly restive under the reactionary powers of the Catholic Church, the landed aristocracy, and the army. In Marxist theory, fascism is the last fling of the ruling class and the bourgeoisie in their attempt to hold down the workers.

Italian Fascism. The corporate state set up by Benito Mussolini in Italy claimed to be neither capitalist nor socialist, and after its inception in 1922 the Fascist Party became the only recognised one. Its members wore black shirts, were organised in military formations, used the Roman greeting of the outstretched arm, and adopted as their slogan "Mussolini is always right." Membership of the Party was not allowed to exceed a number thought to be suited to the optimum size of a governing class and new candidates were drawn, after strict examinations, from the youth organisations. The Blackshirts, a fascist militia, existed separately from the army and were ruled by Fascist Headquarters.

At the head of government was Mussolini, "Il Duce" himself, a cabinet of fourteen ministers selected by him and approved by the King to supervise the various functions of government, and the Grand Council or directorate of the Fascist Party, all the members of which were chosen by the Duce. Parliament, which was not allowed to initiate legislation but only to approve decrees from above, consisted of a Senate with life-membership and a Chamber of Fasci and Corporations composed of nominated members of the Party, the National Council of Corporations, and selected representatives of the employers' and employees' confederations. Private enterprise was encouraged and protected but rigidly controlled; strikes were forbidden, but a Charter of Labour enforced the collaboration of workers and employers whose disputes were settled in labour courts presided over by the Party. All decisions relating to industry were government-controlled (*e.g.*, wages, prices, conditions of employment and dismissal, the expansion or limitation of production), and some industries such as mining, shipping, and armaments were largely state-owned.

Italian fascism served as a model in other countries, notably for the German National Socialist Party, in Spain and Japan, and most European nations between the wars had their small Fascist parties, the British version led by Sir Oswald Mosley being known as the British Union which advocated the abolition of free speech, greater interest in the Commonwealth, and anti-semitism. Although fascism in all countries has certain recognisable characteristics, it would be wrong to think of it as an international movement taking fixed forms and with a clearly thought-out rationale as in the case of communism. It is doubtful, for example, whether Japanese "fascism" was entitled to be described as such, and the Spanish Falange differs in many respects both in outlook and origins from the German or Italian varieties. In fact the word "fascist," like "bolshevik," is often used as a purely emotive term of abuse. *See* Falange, Nazism.

Fatalism. *See* Determinism.

Fetichism, originally a practice of the natives of West Africa and elsewhere of attributing magical properties to an object which was used as an amulet, for putting spells on others, or regarded as possessing dangerous powers. In psychology the term refers to a sexual perversion in which objects such as shoes, brassières, hair, etc., arouse sexual excitement.

Feudalism. The feudal system took its origins from Saxon times and broadly speaking lasted until the end of the 13th cent. It was a military and political organisation based on land tenure, for, of course, society throughout this period was based almost entirely on agriculture. The activities of men divided them into three classes or estates. The First Estate was the clergy, responsible for man's spiritual needs; the Second was the nobility, including kings and emperor as well as the lesser nobles; the Third was composed of all those who had to do with the economic and mainly agricultural life of Europe. The praying men, the fighting men and administrators, and the toilers were all held to be dependent on each other in a web of mutual responsibilities.

The theory of feudalism, although it by no means always worked out in practice, was as follows: the earth was God's and therefore no man owned land in the modern sense of the word. God had given the pope spiritual charge of men, and secular power over them to the emperor from whom kings held their kingdoms, and in turn the dukes and counts received the land over which they held sway from the king. Members of the Second Estate held their lands on the condition of fulfilling certain obligations to their overlord and to the people living under them, so when a noble received a fief or piece of land he became the vassal of the man who bestowed it. To him he owed military service for a specified period of the year, attendance at court, and giving his lord counsel. He undertook to ransom his lord when he fell into enemy hands and to contribute to his daughter's dowry and at the knighting of his son. In return the lord offered his vassal protection and justice, received the vassal's sons into his household and educated them for knighthood.

The system was complicated by the fact that large fiefs might be subdivided and abbots often governed church lands held in fief from nobles. The serf or toiling man dwelt on the land of a feudal noble or churchman where he rendered service by tilling the soil or carrying out his craft for his manorial lord in return for protection, justice, and the security of his life and land. He was given a share in the common lands or pastures from which he provided for his own needs. In the modern sense he was not free (although at a later stage he could buy his freedom) since he was attached to the soil and could not leave without the lord's permission. On the other hand he could neither be deprived of his land nor lose his livelihood. Feudal tenures were abolished in England by statute in 1660, although they had for long been inoperative. In Japan a feudal system existed up to 1871, in Russia until 1917, and many relics of it still linger on (*e.g.* the *mezzadria* system of land tenure in parts of Italy).

Fourierism. *See* Utopianism.

Freemasonry, a secret organisation with different systems in different countries. It shares with other secret societies the characteristics of being secret, having signs by which one fellow-member can recognise another, initiation ceremonies, peculiar regalia, and various grades of enlightenment. In England freemasonry was first organised in 1717 and in France and Germany in 1725 and 1737 respectively. Masons claim to be working for the good of mankind, and carry out various charitable works. Many notable people are in the movement. Whatever their beliefs there can be no doubt that on the continent freemasons have intervened in politics and the organisation is banned by the Roman Catholic Church. Absurd attempts have been made (and quite possibly are part of Masonic belief) to trace the society back to early and even Biblical times. Historically, of course, this is absurd, nor have freemasons any connection with the masons' guilds of the Middle Ages which were intended for masons in the ordinary sense of the word.

Freudian theory. *See* Section F, Part III.

Friends, The Society of, or Quakers, a religious body founded in England in the 17th cent. by George Fox (1624–91). The essence of their faith is that every individual who believes has the power of direct communication with God who will guide him into the ways of truth. This power comes from the "inner light" of his own heart, the light of Christ. Quakers meet for worship avoiding all ritual, without ordained ministers or prepared sermons; there is complete silence until someone is moved by the Holy Spirit to utter his message.

In the early days Quakers gave vent to

violent outbursts and disturbed church services. Friends had the habit of preaching at anyone who happened to be nearby, their denunciation of "steeple-houses" and references to the "inner light," their addressing everyone as "thee" and "thou," their refusal to go beyond "yea" and "nay" in making an assertion and refusing to go further in taking an oath, must have played some part in bringing about the savage persecutions they were forced to endure. Many emigrated to Pennsylvania, founded by William Penn in 1682, and missionaries were sent to many parts of the world. The former violence gave way to gentleness. Friends not only refused to take part in war but even refused to resist personal violence. They took the lead in abolishing slavery, worked for prison reform and better education. As we know them today Quakers are quiet, sincere, undemonstrative people, given to a somewhat serious turn of mind. The former peculiarities of custom and dress have been dropped and interpretation of the Scriptures is more liberal. Although Quakers refuse to take part in warfare, they are always ready to help the victims of war, by organising relief, helping refugees in distress, or sending their ambulance units into the heat of battle.

G

Gestalt Psychology. Whilst Behaviourism (*q.v.*) was emerging in America a new school of thought was arising in Germany which has revolutionised the outlook of psychology in certain fields and is one of the most important schools of today. Basically dealing with problems of perception and learning, it took issue with the old concept of the **Associationists** (*q.v.*) that mental life was based on the "association of ideas," and one of the doctrines of the Behaviourists and others that learning is based either on a process of trial and error or conditioning. The three founders of the school were Max Wertheimer, Wolfgang Köhler, and Kurt Koffka who named it the Gestalt school—a German word which is retained because it had no definite English counterpart but may roughly be translated as "pattern" or "configuration." They meant by this that the human mind has a natural tendency to find significant patterns among sensations, contrary to the Associationist view that initially we simply experience atomised elements which we later learn to associate together as an object. The latter was described by the new school as a "brick and mortar" psychology which explained where the bricks came from but failed to explain the mortar which makes the elements a whole. (The whole is not the mere sum of its parts.) Thus a tune is made up from notes in a scale but is not present in them individually, and the tune is still present if we change the key using entirely different notes. Pattern and relationships which have significance are at the basis of mental activity, especially in learning. Thus experiments have shown that if hens are presented with grain laid on both white and grey pieces of paper and are allowed to eat from the grey but are shooed away from the white, they soon learn to go to the grey piece only. This, the Associationists would say, is a perfect example of the association of ideas: white equals punishment, grey equals food, so naturally the paper associated with food wins. But Köhler did a further experiment and substituted black for the white paper. If the theory of association were correct, the hens would still feed at the grey paper which they had learned to associate with food. In fact, they went to the grain on the black paper. The obvious explanation was that the birds were not responding to a simple association, grey equals food, but to the relationship "darker than." They took in the whole situation, not just parts of it.

Similarly the Behaviourist theory of learning was one of conditioning—the dog presented with food preceded by a whistle soon begins to salivate at the whistle alone. Other psychologists emphasised the process of trial and error showing, for example, that a cat placed in a box which could only be opened by a latch or by pulling a wire loop to reach a plate of food outside, at first made completely random movements until by chance the correct one happened to be made. On subsequent occasions the random element grew less and less and thus the cat ultimately learned to go straight for the latch. But Köhler criticised these experiments (without denying that some learning may be by either conditioning or trial and error) by pointing out that in most of the trial and error experiments where mazes or puzzle boxes were used the *whole situation* was not open to the animal's inspection. An important element in learning, even in animals, is insight. Thus a dog separated from food by a length of fencing will almost immediately run around the fence provided it can see its ends. A chimpanzee with a banana outside its cage and a suitable stick inside within the same field of vision will soon use it to poke the fruit inside. But if the stick is lying at the back of the cage the absence of a compact visual pattern of stick and banana will likely cause it to fail. Gestalt, in short, emphasises the pattern-finding and significance-seeking tendencies of the mind and its ability to learn by insight. It has also criticised the type of personality test which lists individual traits, giving the subject a rating for each trait, on the ground that such tests do not show the function of each trait in the total personality which is an organised whole rather than the sum of its individual characteristics.

Gnosticism. Among the many heresies of early Christianity, especially during its first two centuries, was a group which came under the heading of Gnosticism. This was a system or set of systems which attempted to combine Christian beliefs with others derived from Oriental and Greek sources, especially those which were of a mystical and metaphysical nature, such as the doctrines of Plato and Pythagoras. There were many Gnostic sects, the most celebrated being the Alexandrian school of Valentius (fl. *c.* 136–*c.* 160). "Gnosis" was understood not as meaning "knowledge" or "understanding" as we understand these words, but "revelation." As in other mystical religions, the ultimate object was individual salvation; sacraments took the most varied forms. Many who professed themselves Christians accepted Gnostic doctrines and even orthodox Christianity contains some elements of Gnostic mysticism. It was left to the bishops and theologians to decide at what point Gnosticism ceased to be orthodox and a difficult task this proved to be. Two of the greatest, Clement of Alexandria and his pupil Origen, unwittingly slipped into heresy when they tried to show that such men as Socrates and Plato, who were in quest of truth, were Christian in intention, and by their lives and works had prepared the way for Christ. Thus they contradicted Church doctrine which specifically said *Extra ecclesiam nulla salus*—outside the Church there is no salvation.

God and Man. The idea of gods came before the idea of God and even earlier in the evolution of religious thought there existed belief in spirits (*see* **Animism**). It was only as a result of a long period of development that the notion of a universal "God" arose, a development particularly well documented in the Old Testament. Here we are concerned only with the views of philosophers, the views of specific religious bodies being given under the appropriate headings. First, however, some definitions.

Atheism is the positive disbelief in the existence of a God. **Agnosticism** (a term coined by T. H. Huxley, the 19th cent. biologist and contemporary of Darwin) signifies that one cannot know whether God exists or not. **Deism** is the acceptance of the existence of God, not through revelation, but as a hypothesis required by reason. **Theism** also accepts the existence of God, but, unlike Deism, does not reject the evidence of revelation (*e.g.*, in the Bible or in the lives of the saints). **Pantheism** is the identification of God with all that exists (*i.e.*, with the whole universe). **Monotheism** is the belief in one God, **Polytheism** the belief in many (*see also* **Dualism**).

Early Greek Views. Among the early Greek philosophers, Thales (c. 624–565 B.C.) of Miletus,

in Asia Minor. Anaximander (611–547 B.C.), his pupil, and Anaximenes (b. *c.* 570 B.C.), another Miletan, were men of scientific curiosity and their speculations about the origin of the universe were untouched by religious thought. They were basically materialist and atheist in thought. Heraclitus of Ephesus (*c.* 540–475 B.C.), the philosopher of change, and the founder of metaphysics, was scornful of the popular religion of his day. For him fire was the prime element—the *Logos*—the most complete embodiment of the process of Becoming. Empedocles of Agrigentum in Sicily (*c.* 500–*c.* 430 B.C.) introduced the idea of opposition and affinity. All matter is composed of the so-called four elements—*earth, water, air,* and *fire*—which are in opposition or alliance with each other. All these were materialist philosophers who sought to explain the working of the universe without recourse to the gods.

Socrates, Plato, and Aristotle. Socrates (470–399 B.C.) was primarily concerned with ethical matters and conduct rather than the nature of the universe. For him goodness and virtue come from knowledge. He obeyed an "inner voice" and suffered death rather than give up his philosophy. He believed in the persistence of life after death and was essentially a monotheist. Plato (427–347 B.C.) was chiefly concerned with the nature of reality and thought in terms of absolute truths which were unchanging, logical, and mathematical. (*See* **Mind and Matter.**) Aristotle (384–322 B.C.) took his view of matter not from Democritus (atomic view) but from Empedocles (doctrine of four elements), a view which came to fit in well with orthodox mediaeval theology. Matter is conceived of as potentially alive and striving to attain its particular form, being moved by divine spirit or mind (*nous*). (An acorn, for example, is matter which contains the form "oak-tree" towards which it strives.) Thus there is a whole series from the simplest level of matter to the perfect living individual. But there must be a supreme source of all movement upon which the whole of Nature depends, a Being that Aristotle describes as the "Unmoved Mover," the ultimate cause of all becoming in the universe. This Being is pure intelligence, a philosopher's God, not a personal one. Unlike Plato, Aristotle did not believe in survival after death, holding that the divine, that is the immortal element in man, is mind.

Among the later Greek thinkers the Epicureans were polytheists whose gods, however, were denied supernatural powers. The Stoics built up a materialist theory of the universe, based on the Aristotelian model. To them God was an all-pervading force, related to the world as the soul is related to the body, but they conceived of it as material. They developed the mystical side of Plato's idealism and were much attracted by the astrology coming from Babylonia. They were pantheists. The Sceptics were agnostics.

From Pagan to Christian Thought. Philo, "the Jew of Alexandria," who was about 20 years older than Jesus, tried to show that the Jewish scriptures were in line with the best in Greek thought. He introduced the *Logos* as a bridge between the two systems. Philo's God is remote from the world, above and beyond all thought and being, and as His perfection does not permit direct contact with matter the divine *Logos* acts as intermediary between God and man. Plotinus (204–70), a Roman, and the founder of Neoplatonism, was the last of the great pagan philosophers. Like Philo, he believed that God had created the world indirectly through emanations—beings coming from Him but not of Him. The world needs God but God does not need the world. Creation is a fall from God, especially the human soul when enmeshed in the body and the world of the senses, yet (*see* **Determinism**) man has the ability to free himself from sense domination and turn towards God. Neoplatonism was the final stage of Greek thought drawing its inspiration from the mystical side of Plato's idealism and its ethics from Stoicism.

Christianity: The Fathers and the Schoolmen. It was mainly through St. Augustine (354–430), Bishop of Hippo in North Africa, that certain of the doctrines of Neoplatonism found their way into Christianity. Augustine also emphasised the concept of God as all good, all wise, all knowing, transcendent, the Creator of the universe out of nothing. But, he added, since God knows everything, everything is determined by Him forever. This is the doctrine of predestination and its subsequent history is discussed under **Determinism.**

In the early centuries of Christianity, as we have seen, some found it difficult to reconcile God's perfection with His creation of the universe and introduced the concept of the *Logos* which many identified with Christ. Further, it came to be held that a power of divine origin permeated the universe, namely the Holy Spirit or Holy Ghost. Some theory had to be worked out to explain the relationships of these three entities whence arose the conception of the Trinity. God is One; but He is also Three: Father, Son (the *Logos* or Christ), and Holy Ghost.

This doctrine was argued by the Apologists and the Modalists. The former maintained that the *Logos* and the Holy Spirit were emanations from God and that Jesus was the *Logos* in the form of a man. The Modalists held that all three Persons of the Trinity were God in three forms or modes: the *Logos* is God creating, the Holy Spirit God reasoning, and God is God being. This led to a long discussion as to whether the *Logos* was an emanation from God or God in another form; was the *Logos* of like *nature* with God or of the same *substance*? This was resolved at the Council of Nicaea (325) when Athanasius formulated the orthodox doctrine against Arius (*q.v.*): that the one Godhead is a Trinity of the same substance, three Persons of the same nature—Father, Son, and Holy Ghost.

St. Thomas Aquinas (1227–74), influenced greatly by Aristotle's doctrines, set the pattern for all subsequent Catholic belief even to the present time. He produced rational arguments for God's existence: *e.g.*, Aristotle's argument that, since movement exists, there must be a prime mover, the Unmoved Mover or God; further, we can see that things in the universe are related in a scale from the less to the more complex, from the less to the more perfect, and this leads us to suppose that at the peak there must be a Being with absolute perfection. God is the first and final cause of the universe, absolutely perfect, the Creator of everything out of nothing. He reveals Himself in his Creation and rules the universe through His perfect will. How Aquinas dealt with the problem of predestination is told under **Determinism.**

Break with Mediaeval Thought. Renaissance thinkers, free to think for themselves, doubted the validity of the arguments of the Schoolmen but most were unwilling to give up the idea of God (nor would it have been safe to do so). Mystics (*see* **Mysticism**) or near-mystics such as Nicholas of Cusa (*c.* 1401–64) and Jacob Boehme (1575–1624) taught that God was not to be found by reason but was a fact of the immediate intuition of the mystical experience. Giordano Bruno held that God was immanent in the infinite universe. He is the unity of all opposites, a unity without opposites, which the human mind cannot grasp. Bruno was burned at the stake in 1600 at the instigation of the Inquisition (a body which, so we are told, never caused pain to anyone since it was the civil power, not the Inquisition, that carried out the unpleasant sentences) for his heresy.

Francis Bacon, who died in 1626, separated, as was the tendency of that time, science from religion. The latter he divided into the two categories of natural and revealed theology. The former, through the study of nature, may give convincing proof of the existence of a God but nothing more. Of revealed theology he said: "we must quit the small vessel of human reason . . . as we are obliged to obey the divine law, though our will murmurs against it, so we are obliged to believe in the word of God, though our reason is shocked at it." Hobbes (d. 1679) was a complete materialist and one feels that obeisance to the notion was politic rather than from conviction. However, he does mention God as starting the universe in motion;

infers that God is corporeal but denies that His nature can be known.

From Descartes Onwards. Descartes (1596–1650) separated mind and body as different entities but believed that the existence of God could be deduced by the fact that the idea of him existed in the mind. Whatever God puts into man, including his ideas, must be real. God is self-caused, omniscient, omnipotent, eternal, all goodness and truth. But Descartes neglected to explain how mind separate from body can influence body, or God separate from the world can influence matter.

Spinoza (1632–77) declared that all existence is embraced in one substance—God, the all-in-all. He was a pantheist and as such was rejected by his Jewish brethren. But Spinoza's God has neither personality nor consciousness, intelligence nor purpose, although all things follow in strict law from His nature. All the thought of everyone in the world, make up God's thoughts.

Bishop Berkeley (1685–1753) took the view that things exist only when they are perceived, and this naturally implies that a tree, for example, ceases to exist when nobody is looking at it. This problem was solved to his own satisfaction by assuming that God, seeing everything, prevented objects from disappearing when we were not present. The world is a creation of God but it is a spiritual or mental world, not a material one.

Hume (1711–76), who was a sceptic, held that human reason cannot demonstrate the existence of God and all past arguments to show that it could were fallacious. Yet we must believe in God since the basis of all hope, morality, and society is based upon the belief. Kant (1724–1804) held a theory similar to that of Hume. We cannot know by reason that God exists, nor can we prove on the basis of argument anything about God. But we can form an idea of the whole of the universe, the one Absolute Whole, and personify it. We need the idea of God on which to base our moral life, although this idea of God is transcendent, *i.e.*, goes beyond experience.

William James (1842–1910), the American philosopher (*see* **Pragmatism**), held much the same view: God cannot be proved to exist, but we have a will to believe which must be satisfied, and the idea works in practice. Hegel (1770–1831) thought of God as a developing process, beginning with "the Absolute" or First Cause and finding its highest expression in man's mind, or reason. It is in man that God most clearly becomes aware of Himself. Finally Comte (1798–1857), the positivist, held that religion belongs to a more primitive state of society and, like many modern philosophers, turned the problem over to believers as being none of the business of science.

Good and Evil.

Early Philosophers' Views. The early Greek philosophers were chiefly concerned with the laws of the universe, consequently it was common belief that knowledge of these laws, and living according to them, constituted the supreme good. Heraclitus, for example, who taught that all things carried with them their opposites, held that good and evil were like two notes in a harmony, necessary to each other. "It is the opposite which is good for us." Democritus, like Epicurus (*q.v.*), held that the main goal of life is happiness, but happiness in moderation. The good man is not merely the one who *does* good but who always *wants* to do so: "You can tell the good man not by his deeds alone but by his desires." Such goodness brings happiness, the ultimate goal. On the other hand, many of the wandering Sophist teachers taught that good was merely social convention, that there are no absolute principles of right and wrong, that each man should live according to his desires and make his own moral code. To Socrates knowledge was the highest good because doing wrong is the result of ignorance: "no man is voluntarily bad." Plato and Aristotle, differing in many other respects, drew attention to the fact that man is composed of three parts: his desires and appetites, his will, and his reason. A man whose reason rules his will and appetites is not only a good but a happy man; for happiness is not an aim in itself but a by-product of the good life. Aristotle, however, emphasised the goal of self-realisation, and thought that if the goal of life is (as Plato had said) a rational attitude towards the feelings and desires, it needs to be further defined. Aristotle defined it as the "Golden Mean"—the good man is one who does not go to extremes but balances one extreme against another. Thus courage is a mean between cowardice and foolhardiness. The later philosophers Philo and Plotinus held that evil was in the very nature of the body and its senses. Goodness could only be achieved by giving up the life of the senses and, freed from the domination of the body, turning to God, the source of goodness.

Christian Views. St. Augustine taught that everything in the universe is good. Even those things which appear evil are good in that they fit with the harmony of the universe like shadows in a painting. Man should turn his back on the pleasures of the world and turn to the love of God. Peter Abelard (1079–1142) made the more sophisticated distinction when he suggested that the wrongness of an act lies not in the act itself, but in the intention of the doer: "God considers not what is done but in what spirit it is done; and the merit or praise of the agent lies not in the deed but in the intention." If we do what we believe to be right, we may err, but we do not sin. The only sinful man is he who deliberately sets out to do what he knows to be wrong. St. Thomas Aquinas agreed with Aristotle in that he believed the highest good to be realisation of self as God has ordained, and he also agreed with Abelard that intention is important. Even a good act is not good unless the doer intended it to have good consequences. Intention will not make a bad act good, but it is the only thing that will make a good act genuinely good.

In general, Christianity has had difficulties in solving the problem of the existence of evil; for even when one accepts that the evil men do is somehow tied up with the body, it is still difficult to answer the question: how could an all-good God create evil? This is answered in one of two ways: (*a*) that Adam was given free-will and chose to sin (an answer which still does not explain how sin could exist anywhere in the universe of a God who created everything); (*b*) by denying the reality of evil as some Christians have chosen to do (*e.g.*, Christian Science *q.v.*). The Eastern religions, on the other hand (*see* **Zoroastrianism**), solved the problem in a more realistic way by a dualism which denied that their gods were the creators of the whole universe and allowed the existence of at least two gods, one good and one evil. In Christianity there is, of course, a Devil, but it is not explained whence his evil nature came.

Later Philosophic Views. Hobbes equated good with pleasure, evil with pain. They are relative to the individual man in the sense that "one man's meat is another man's poison." Descartes believed that the power to distinguish between good and evil given by God to man is not complete, so that man does evil through ignorance. We act with insufficient knowledge and on inadequate evidence. Locke, believing that at birth the mind is a blank slate, held that men get their opinions of right and wrong from their parents. By and large, happiness is good and pain is evil. But men do not always agree over what is pleasurable and what not. Hence laws exist and these fall into three categories: (1) the divine law; (2) civil laws; (3) matters of opinion or reputation which are enforced by the fact that men do not like to incur the disapproval of their friends. We learn by experience that evil brings pain and good acts bring pleasure, and, basically, one is good because not to be so would bring discomfort.

Kant (*see* **God and Man**) found moral beliefs to be inherent in man whether or not they can be proved by reason. There is a categorical imperative which makes us realise the validity of two universal laws: (1) "always act in such a way that the maxim determining your conduct might well become a universal law; act so that you can will that everybody shall follow the

principle of your action ; (2) "always act so as to treat humanity, whether in thine own person or in that of another, in every case as an end and never as a means."

Schopenhauer (1788–1860) was influenced by Buddhism and saw the will as a blind impelling striving, and desire as the cause of all suffering. The remedy is to regard sympathy and pity as the basis of all morality and to deny one's individual will. This is made easier if we realise that everyone is part of the Universal Will and therefore the one against whom we are struggling is part of the same whole as ourselves.

John Stuart Mill and Jeremy Bentham were both representatives of the Utilitarian school, believing that good is the greatest good (happiness) of the greatest number (*see* **Utilitarianism**). Lastly, there is the view held mostly by political thinkers that good is what is good for the state or society in general (*see* **State and Man**).

Guild Socialism, a British form of syndicalism (*q.v.*) created in 1906 by an architect, A. J. Penty, who was soon joined by A. R. Orage, S. G. Hobson, and G. D. H. Cole. The background to the movement was the situation that, although at that time the Labour Party had 29 members in the House of Commons, a period of severe economic crisis had shown the government unwilling and the Labourites unable to do anything about it; the workers were resorting again to direct action to secure their demands and the democratic and constitutional methods to which the Fabians had partly persuaded them seemed to have failed. The guild socialists advocated a restoration of the mediaeval guild system as was being recommended by the French syndicalists whose programme involved a return to direct economic action, a functional industrial structure, return of craftsmanship, and distrust of the state. Guild socialists believed that value was created by society as a whole rather than by individuals singly, and that capitalist economists had recommended the acquisition of wealth without emphasising the social responsibilities which wealth should bring. The trade unions were to be organised to take over and run their own industries after nationalisation. Thus guild socialists were not only against capitalism but also against state socialism in which the state took over the control of industry. Political authority was held to be uncongenial to human freedom and therefore nothing was to be gained by the substitution of state bureaucracy for capitalist control. The National Guilds League, formed in 1915, advocated the abolition of the wages system, self-government in industry, control by a system of national guilds acting in conjunction with other functional democratic organisations in the community. This body was dissolved in 1925, but the theories of guild socialism have undoubtedly influenced British socialism.

Heresy, originally meant a sect or school of thought holding views different from others (*e.g.*, Pharisees and Sadducees within Judaism). Later it came to mean beliefs contrary to orthodox teaching (*e.g.*, Arianism, Apollinarianism, Nestorianism).

Hinduism, the religion and social institutions of the great majority of the people of India. Hinduism has no fixed scriptural canon but its doctrines are to be found in certain ancient works, notably the *Veda*, the *Brahmanas*, the *Upanishads*, and the *Bhagavad-gita*. The dark-skinned Dravidians invaded India between about 3250 and 2750 B.C. and established a civilisation in the Indus valley. They were polytheists who worshipped a number of nature-gods; some elements of their beliefs persisted into Hinduism. They were subdued by a light-skinned Nordic people who invaded from Asia Minor and Iran about 1500 B.C. The language of these Aryan people was Vedic, parent of Sanskrit in which their religious literature (the Vedas) came to be written after many centuries of oral transmission.

The *Veda* or Sacred Lore has come down to us in the form of mantras or hymns of which there are four great collections, the best-known being the *Rig-Veda*. These Vedic Aryans worshipped nature-deities, their favourites being Indra (rain), Agni (fire), and Surya (the sun). Their religion contained no idolatry but became contaminated by the more primitive beliefs of the conquered Dravidians. Sacrifice and ritual became predominant in a ceremonial religion.

As a reaction a more philosophic form arose (*c.* 500 B.C.) with its scriptures in the *Upanishads*. At its highest level, known as Brahmanism, belief is in a subtle and sophisticated form of monotheism (*Brahma* is an impersonal, all-embracing spirit), but there is a tolerant acceptance of more primitive beliefs. Thus Vishnu (a conservative principle) and Siva (a destructive principle) grew out of Vedic conceptions. The two great doctrines of Hinduism are *karma* and transmigration. The universal desire to be reunited with the absolute (the *Atman* or *Brahma*) can be satisfied by following the path of knowledge. Life is a cycle of lives (*samsara*) in which man's destiny is determined by his deeds (*karma*) from which he may seek release (*moksa*) through ascetic practices or the discipline of Yoga (*q.v.*). Failure to achieve release means reincarnation—migration to a higher or lower form of life after death—until the ultimate goal of absorption in the absolute is reached.

In the great Sanskrit epic poems *Ramayana* and *Mahabharata* the deity takes three forms, represented by the divine personalities of Brahma, Vishnu, and Siva. There are also lower gods, demi-gods, supernatural beings, and members of the trinity may even become incarnate, as Vishnu became identified with Krishna, one of the heroes of the *Mahabharata* and the well-known *Bhagavad-gita*.

The ritual and legalistic side of Brahmanism is the caste system based on the elaborate codes of the *Law of Manu*, according to which God created distinct orders of men as He created distinct species of animals and plants. Men are born to be Brahmans, soldiers, agriculturists, or servants, but since a Brahman may marry a woman from any of these castes, an endless number of sub-castes arises.

Hinduism has always shown great tolerance for varieties of belief and practice. Ideas pleasant and unpleasant have been assimilated: fetichism, demon-cults, animal-worship, sexual-cults (such as the rites of *Kali* in Calcutta). Today, as would be expected in a country which is in the throes of vast social change, Hinduism itself is changing. Under the impact of modern conditions new ideas are destroying old beliefs and customs. *See also* **Jainism, Sikhism.**

Humanism, the term applied to (1) a system of education based on the Greek and Latin classics; and (2) the vigorous attitudes that accompanied the end of the Middle Ages and were represented at different periods by the Renaissance, the Reformation, the Industrial Revolution, and the struggle for democracy. These include: release from ecclesiastical authority, the liberation of the intellect, faith in progress, the belief that man himself can improve his own conditions without supernatural help and, indeed, has a duty to do so. "Man is the measure of all things" is the keynote of humanism. The humanist has faith in man's intellectual and spiritual resources not only to bring knowledge and understanding of the world but to solve the moral problems of how to use that knowledge. That man should show respect to man irrespective of class, race or creed is fundamental to the humanist attitude to life. Among the fundamental moral principles he would count those of freedom, justice and happiness.

The British Humanist Association condemns the religious clauses of the 1944 Education Act and wants compulsory religious instruction in schools abolished.

Humanity, Religion of. *See* **Positivism.**

Hussites, the followers of John Hus, the most famous pupil of John Wyclif. He was the rector of Prague University and, although it is now by no means certain that his beliefs were heretical, he was condemned to death for heresy and burnt at the stake in 1415 at Constance whence he had come with a safe conduct issued by the Emperor Sigismund of Hungary. The latter based his action on the doctrine that no faith need be kept with heretics, but it is

obvious that the main objection to Hus was his contempt for authority of any kind. After their leader's death the Hussites became a formidable body in Bohemia and Moravia. They took up arms on behalf of their faith, their religion being strongly imbued with political feeling (hostility to Germanism and to the supremacy of the Roman Church). Their religious struggles for reform led to the Hussite Wars during which the movement splintered into several groups.

I

Iconoclast Heresy. In 726 the Byzantine Emperor Leo III forbade the use of images in worship by Imperial decree—a decree which was continued intermittently until 843 when the heresy was abandoned. This was the Iconoclast controversy in which Emperor and Papacy were violently opposed. In the end the image-worshippers triumphed and the sacred pictures (icons) have remained to this day. This ecclesiastical conflict between the Iconoclasts and the Papacy over a matter of ritual was the first of the crises which over three centuries were finally to bring about the schism between Orthodox Christendom and Western Christendom. Though temporary, the supremacy of the State over the Church was nevertheless of supreme importance. Although the Iconoclast heresy is often given as the reason for the absence of statues in the Eastern Churches there is no evidence that they existed to any extent even before the movement began.

Idealism, in a philosophical sense, the belief that there is no matter in the universe, that all that exists is mind or spirit. *See* **Mind and Matter** and **Realism.**

Immaculate Conception, one of the important dogmas concerning the Blessed Virgin Mary, as taught by the Roman Catholic Church, is that she was conceived and born without original sin (according to a bull of Pius IX, 1854). Christians in general believe in the immaculate conception of Jesus Christ.

Immortality. The belief in a life after death has been widely held since the earliest times. It has certainly not been universal, nor has it always taken a form which everyone would find satisfying. In the early stages of human history or prehistory everything contained a spirit (*see* **Animism**) and it is obvious from the objects left in early graves that the dead were expected to exist in some form after death. The experience of dreams, too, seemed to suggest to the unsophisticated that there was a part of man which could leave his body and wander elsewhere during sleep. In order to save space, it will be helpful to classify the various types of belief which have existed in philosophical thought regarding this problem: (1) There is the idea that, although *something* survives bodily death, it is not necessarily eternal. Thus most primitive peoples were prepared to believe that man's spirit haunted the place around his grave and that food and drink should be set out for it, but that this spirit did not go on forever and gradually faded away. (2) The ancient Greeks and Hebrews believed for the most part that the souls of the dead went to a place of shades there to pine for the world of men. Their whining ghosts spent eternity in a dark, uninviting region in misery and remorse. (3) Other people, and there were many more of these, believed in the transmigration of souls with the former life of the individual determining whether his next life would be at a higher or lower level. Sometimes this process seems to have been thought of as simply going on and on, by others (*e.g.*, in Hinduism and Buddhism) as terminating in either non-sentience or union with God but in any case in annihilation of the self as self. Believers in this theory were the Greek philosophers Pythagoras, Empedocles, Plato (who believed that soul comes from God and strives to return to God, according to his own rather confused notions of the deity. If it fails to free itself completely from the body it will sink lower and lower from one body to another.) Plotinus held similar views to Plato, and many other religious sects in addition to those mentioned have believed in transmigration. (4) The belief of Plato and Aristotle that if souls continue to exist after death there is no reason why they should not have existed before birth (this in part is covered by (3)), but some have pointed out that eternity does not mean "from now on," but the whole of time before and after "now"—nobody, however, so far as one knows, held that *individual* souls so exist. (5) The theory that the soul does not exist at all and therefore immortality is meaningless: this was held by Anaximenes in early Greek times; by Leucippus, Democritus, and the other Greek atomists; by the Epicureans from the Greek Epicurus to the Roman Lucretius; by the British Hobbes and Hume; by Comte of France; and William James and John Dewey of America. (6) The thesis, held notably by Locke and Kant, that although we cannot prove the reality of soul and immortality by pure reason, belief in them should be held for moral ends. (For the orthodox Christian view *see* **God and Man, Determinism and Free-will.**) From this summary we can see that many philosophies and religions (with the important exceptions of Islam and Christianity) without denying a future life do deny the permanence of the individual soul in anything resembling its earthly form (*see* **Spiritualism, Psychic research**).

Imperialism, the practice by a country, which has become a nation and embarked upon commercial and industrial expansion, of acquiring and administering territories, inhabited by peoples usually at a lower stage of development, as colonies or dependencies. Thus the "typical" imperialist powers of the 19th cent. and earlier were Britain, Belgium, Holland, Spain, and Portugal, whilst Germany, Italy, and Japan, which either did not have unity during this period or adequate industrial expansion, tried to make good their lacks in this direction by war in the 20th cent. The term "imperialism" is not easy to define today (although often enough used as a term of abuse). Many people accuse the Soviet Union of imperialism—not only because she does not permit free elections in her satellites, but also because she still holds the vast Asiatic empire acquired by the Tsars in times past. There is also what may be described as economic and ideological imperialism and here America is by no means guiltless. The Afrikaners in South Africa pass laws to permit the exploitation of the Black and Coloured peoples in their midst. Israel, too, whatever one may think of its creation on humanitarian grounds, is surely a piece of land taken from the Arabs who formed 90 per cent of its population, by a people whose only rational claim is that their ancestors lived there two thousand years ago. Imperialism is a dangerous word and, before using it, we would do well to remember the retort of a British statesman who, when lecturing in America prior to Indian independence, was asked by an elderly matron: "What are you going to do about the Indians?" "Which Indians, madam—ours or yours?"

Individual Psychology. The term is applied to the psychological system of Alfred Adler of Vienna (1870–1937) who, together with C. G. Jung (*see* **Analytical Psychology**), broke with Freud in 1911. Adler's system of psychotherapy is based on the idea, not of sex as a driving force as in the case of Freud, but on the concept of "compensation" or a drive for power in an attempt to overcome the "inferiority complex" which he held to be universal in human beings. The child naturally feels inferior to adults, but bullying, making him feel insignificant or guilty or contemptible, even spoiling, which makes him feel important within the family but relatively unimportant outside, increases this feeling. Or the child may have physical defects: he may be small or underweight, have to wear glasses, become lame, be constantly ill, or stupid at school. In these ways he develops a sense of inferiority which for the rest of his life he develops a technique to overcome.

This may be done in several ways: he may try to become capable in the very respects in which he feels incompetent—hence many great orators have originally had speech defects; many painters poor eyesight; many musicians been

partially deaf: like Nietzsche, the weakling, he may write about the superman, or like Sandow, the strong man be born with poor health.

On the other hand he may overdo his attempt and overcompensate. Hence we have the bully who is really a coward, the small man who is self-assertive to an objectionable degree (Hitler, Napoleon, Stalin, and Mussolini were all small men) or the foreigner who like three of these men wanted to be the hero of their adopted country—Hitler the Austrian, Napoleon the Italian, Stalin the Georgian.

But what about the man who can do none of these things who continues to fail to compensate? He, says Adler becomes a neurotic because neurosis is an excuse which means "I could have done so-and-so but . . ." It is the unconscious flight into illness—the desire to be ill. Thus a man who used to have a good job lost it through no fault of his own and developed a "nervous break-down," one of the symptoms of which was a fear of crossing streets. Adler would have asked: "What purpose is served by this symptom?" "Why does he unconsciously not want to cross streets?" The answer was that he had only been offered inferior jobs, and although he felt for his family's sake that he ought to take them, something inside said: "No, I have been an important man and I cannot bear to do insignificant work—if I am unable to cross streets I am unable (through no fault of my own) to go out to work." Adler's treatment involves disclosing these subterfuges we play on ourselves so that we can deal with the real situation in a more realistic way. The criticism of Adler's theory is not that it is not true. It is. But it is not the whole truth, for people are much more subtle than Adler gave them credit for; Freud recognised this element of "secondary gain" in neurosis but he knew that there was more to it than that. Nevertheless Adler's method works well in some simpler cases.

Irrationalism. An attitude that puts emotion and passion before reason.

Islam, the religion of which Mohammed (570–632) was the prophet, the word signifying submission to the will of God. It is one of the most widespread of religions. Its adherents are called Moslems or Muslims. Islam came later than the other great monotheistic religions (Judaism and Christianity) and may be regarded in some respects as a heresy. Mohammed accepted the inspiration of the Old Testament and claimed to be a successor to Moses, and although he did not recognise Jesus as God, he did recognise Him as a prophet (*see* Docetism).

The sacred book of Islam is the Koran, the most influential book in the world next to the Bible. According to Islamic belief the words were revealed to the prophet by God through the angel Gabriel at intervals over a period of 20 years, first at his native Mecca and then at Medina. The book is divided into 114 *suras* or chapters: all but one begin with the words: "In the name of Allah, the Merciful, the Compassionate." It is written in classical Arabic, and Moslems memorise much or all of it. The Koran superseded the Gospel as Mohammed superseded Christ. Its ethical teachings are high.

The great advantage of Mohammedism is that, like orthodox Judaism, it is a literal-minded religion lived in everyday life. No Moslem is in any doubt as to exactly how he should carry on in the events of his day. He has five duties: (1) Once in his life he must say with absolute conviction: "There is no God but Allah, and Mohammed is His Prophet." (2) Prayer preceded by ablution must be five times daily—on rising, at noon, in mid-afternoon, after sunset, and before retiring. The face of the worshipper is turned in the direction of Mecca. (3) The giving of alms generously, including provisions for the poor. (4) The keeping of the fast of Ramadan, the holy month, during which believers in good health may neither eat nor drink nor indulge in worldly pleasures between sunrise and sunset. (5) Once in his life a Moslem, if he can, must make the pilgrimage to Mecca. In addition, drinking, gambling, and the eating of pork are forbidden and circumcision is practised. Polygamy is permitted, although decreasing; sexual relations outside marriage are disapproved of; marriage is only with the wife's consent; and divorce may be initiated by either husband or wife. A great advantage in the spread of Islam has been its lack of race prejudice.

Mohammed's main achievements were the destruction of idolatry, the welding of warring tribes into one community, the progress of a conquest which led after his death to the great and cultured empire which spread throughout the Middle East into north Africa, north India, and ultimately to Spain. That it did not spread all over Europe was due to the Muslim defeat by Charles Martel at Tours in 732 A.D.

J

Jainism. The Jains are a small Indian sect, largely in commerce and finance, numbering about 2 million. Their movement founded by Vardhamana, called Mahavira (the great hero), in the 6th cent. B.C. arose rather earlier than Buddhism in revolt against the ritualism and impersonality of Hinduism (*q.v.*). It rejects the authority of the early Hindu Vedas and does away with many of the Hindu deities whose place is largely taken by Jainism's twenty-four immortal saints; it despises caste distinctions and modifies the two great Hindu doctrines of *karma* and transmigration. Jain philosophy is based on *ahimsa*, the sacredness of all life, regarding even plants as the brethren of mankind, refusing to kill even the smallest insect.

Jansenism, the name given by the Roman Catholic Church to the heresy of Cornelius Jansen (1585–1638), a Dutch-born professor of theology at Louvain, derived from his work *Augustinus*, published after his death. This book set out to prove, by a study of the works of St. Augustine, that Augustine's teachings on grace, predestination and free-will (which, of course, Augustine denied) were opposed to Jesuit teaching. Already hostile to Jansen for forbidding them entry to Louvain university the Jesuits were outraged and in 1653 Pope Innocent V condemned five of Jansen's propositions as heretical. This produced one of the most famous controversies in history in which the scholars and divines of the great convent of Port Royal in Paris defended the *Augustinus*, for which they were later expelled from their posts. Meanwhile the great Pascal (1623–62) had taken up his pen in their defence and exposed Jesuit hypocrisy in his *Lettres Provinciales*, one of the masterpieces of world literature for its brilliant phrasing, delicate irony, and deadly quotation from Jesuit writings. The Letters had great influence, filled the Jesuits with rage, but even Pascal could not stop the cruel persecution which followed. Another Jansenist text-book was published late in the century, Quesnel's *Moral Reflections on the New Testament*, which Pope Clement XI in his bull *Unigenitus* condemned as heretical in 1713. The French Church was split from top to bottom, the aged king Louis XIV supported the bull, and in 1720 it was made part of French law. Most Jansenists fled the country. Thus ended Jansenism in France but a small sect still exists in Holland, Catholic in everything except acceptance of the *Unigenitus*.

Jehovah's Witnesses, a religious body who consider themselves to be the present-day representatives of a religious movement which has existed since Abel "offered unto God a more excellent sacrifice than Cain, by which he obtained witness that he was righteous." Abel was the first "witness," and amongst others were Enoch, Noah, Abraham, Moses, Jeremiah, and John the Baptist. Pre-eminent among witnesses, of course, was Jesus Christ who is described in the Book of Revelation as "the faithful and true witness." Thus they see themselves as "the Lord's organisation," in the long line of those who through the ages have preserved on earth the true and pure worship of God or, as the Witnesses prefer to call Him, "Jehovah-God."

So far as other people are aware, the movement was founded by Charles Taze Russell (Pastor Russell) of Allegany, Pittsburgh, Pennsylvania, U.S.A. in 1881 under the name, adopted in 1896, of the Watch Tower Bible and

Tract Society, which has continued as the controlling organisation of Jehovah's Witnesses. Its magazine, *The Watch Tower Announcing Jehovah's Kingdom*, first published in 1879, and other publications are distributed by the zealous members who carry out the house-to-house canvassing. The movement has a strong leadership.

Their teaching centres upon the early establishment of God's new world on earth, preceded by the second coming of Christ. Witnesses believe this has already happened, and that Armageddon "will come as soon as the Witness is completed." The millennial period will give sinners a second chance of salvation and "millions now living will never die" (the title of one of their pamphlets).

The dead will progressively be raised to the new earth until all the vacant places left after Armageddon are filled. There is, however, some doubt about the "goatish souls" who have made themselves unpleasant to the Witnesses, those who have accepted (or permitted to be accepted) a blood-transfusion contrary to the Scriptures, and others who have committed grave sins.

Every belief held by the movement, it is claimed, can be upheld, chapter and verse, by reference to the Scriptures. Witnesses regard the doctrine of the Trinity as devised by Satan. In both wars Witnesses have been in trouble for their refusal to take part in war and it is only fair to add that six thousand suffered for the same reason in German concentration camps.

Judaism, the religion of the Jews, the oldest of the great monotheist religions, parent of Christianity and Islam, the development of which is presented in the Old Testament. The creed of Judaism is based on the concept of a transcendent and omnipotent One True God, the revelation of His will in the *Torah*, and the special relation between God and His "Chosen People." The idea of Incarnation is rejected, Jesus is not recognised as the Messiah. The *Torah* is the Hebrew name for the Law of Moses (the Pentateuch) which, Judaism holds, was divinely revealed to Moses on Mount Sinai soon after the exodus of the Israelites from Egypt (1230 B.C.). Many critics deny the Mosaic authorship of the first five books of the Bible and believe them to be a compilation from four main sources known as J (Jahvist), E (Elohist), D (Deuteronomist) and P (Priestly Code), distinguished from each other by the name used for God, language, style, and internal evidence. From the historical point of view an important influence on Judaism may have been the monotheism of Ikhnaton, the "heretic" Pharaoh (note, for example, the derivation of Psalm 104 from Ikhnaton's "Hymn to the Sun").

The Talmud is a book containing the civil and canonical laws of the Jews and includes the Mishna, a compilation from oral tradition written in Hebrew, and the Gemara, a collection of comments and criticisms by the Jewish rabbis, written in Aramaic. There are in fact two Talmuds: the one made in Palestine (the Jerusalem Talmud), finished at the beginning of the 5th cent., and the other made in Babylon, completed at the end of the 6th cent.

Judaism at the beginning of the Christian era had a number of sects: (1) the Pharisees (whose views include the first clear statement of the resurrection of the just to eternal life and the future punishment of the wicked) who held to the *Torah* and the universality of God; (2) the Sadducees, the upper class of priests and wealthy landowners, to whom God was essentially a national God and who placed the interests of the state before the *Torah*; they rejected ideas of resurrection and eternal life; (3) the Essenes (*q.v.*) who were regarded as a puritanical break-away movement by both parties. The views of the Pharisees prevailed.

Jewish writing continued through the years and some books were added to the *Torah*, among them the Three Major Prophets and certain books of the Twelve Minor Prophets. There were also the Apocalyptic writers who were unorthodox in their preaching of a divinely planned catastrophic end to the world with a "new Heaven and a new earth," preceded by a divine Messiah, and a future life—all of which beliefs influenced early Christianity. Judah Halevi of Toledo (c. 1085–c. 1140) and Moses Maimonides of Cordova (1135–1204) were the great Jewish philosophers.

Modern movements in Judaism stem from the Enlightenment, notably with Moses Mendelssohn in the 18th cent. who accepted, as was the tendency of the period, only that which could be proved by reason. He translated the Pentateuch into German thus encouraging German Jews to give up Yiddish and Hebrew for the language of the land and thereby preparing them for their vast contribution to Western civilisation. One of his disciples, David Friedländer (d. 1834) instituted "reform" Judaism behind which lay the desire for assimilation. He wanted to eliminate anything that would hamper the relationships of Jews with their neighbours or tend to call in doubt their loyalty to their adopted state. A similar movement in America (1885) called for the rejection of dietary laws, the inauguration of Sunday services, and the repudiation of Jewish nationalism. Between "reform" and orthodoxy there arose the conservative movement which, in England, includes prayers in English in the service, does not segregate men and women in the synagogue, and translates the Law in a more liberal way. (The fact is that it would be almost impossible for a strictly orthodox Jew to live in a modern industrialised community at all.)

Judaism is essentially a social and family religion which, more than almost any other, concerns itself with the observances of every aspect of daily life. As in Islam (*q.v.*) details are laid down in the most minute way for the behaviour of the orthodox.

The home is the main Jewish institution and Jews, like Catholics, cannot surrender their religion. Circumcision takes place eight days after birth, and a boy becomes a man for religious purposes at his Bar Mitzvah at the age of thirteen. Women are spared most of this because their place in the home is considered sufficiently sacred. Among festivals are Passover, recalling the Exodus; Rosh Hashanah (the Jewish New Year), the anniversary of the Creation and the beginning of ten days of penitence ending with Yom Kippur (the Day of Atonement), a day of fasting spent in the synagogue; Purim, celebrating the deliverance of the Jews from Haman; and Chanukah, celebrating their victory against the Syrians under their leader Judas Maccabeus. A new and semi-religious festival is the Yom Haatzmaut the anniversary of the birth of the new Jewish state of Israel.

K

Karma. *See* **Buddhism, Hinduism.**

Ku Klux Klan. After the American Civil War (1861–65) southern conservatives and ex-Confederate leaders began to fear (as they had every reason to do) both Negro and poor White rule. Taxes were rising owing to radical legislation and the tax-burdened and disenfranchised planters finally took to illegal means to achieve their ends by trying to effect an alliance with the poor White and small farmer through appealing to his anti-Negro prejudice.

Hence the Ku Klux Klan was formed in 1866 as a secret society by a small group of Confederate veterans in Tennessee with the intention of frightening Negroes by dressing in ghostly white robes in the guise of the spirits of dead soldiers. But the movement spread like wild-fire throughout the South encouraged by small farmers and planters alike. General Nathan Bedford Forrest was appointed "Grand Wizard" of the Klan "empire" and in every community armed Klansmen riding at night horsewhipped "uppity" Negroes, beat Union soldiers, and threatened carpet-bag politicians (*i.e.*, fortune-hunters from the North). Soon several similar organisations arose, many of which did not stop at torture, burning property, and murder. In fact, although claiming to be a "holy crusade" the Klan was a vicious and contemptible organisation in which former Southern leaders trying to regain control deliberately set poor and middle-class Whites against the Negroes by appeal to race-prejudice. Congress struck

back with laws and intervention of Federal troops, and after a large number of convictions in South Carolina much of the violence stopped even if the feelings continued.

After the 1914–18 war the movement, dormant since 1900, revived as a sadistic anti-Negro, anti-Jewish, anti-Catholic society, spreading to the north as well as the south. By 1926, with its white-gowned hooligans and fiery crosses, the Klan began to subside once more. But it rose again after the second world war. After some cruel racial murders in Alabama during 1964–5 President Johnson denounced K-K-K terrorism and promised new criminal legislation to deal with the Klan.

Kuomintang, a Chinese Nationalist party founded in 1891 by Sun Yat Sen. It took part in the first Chinese revolution of 1911 and led the second the following year, dominating south China by 1930 and, under Chiang Kai-shek, who succeeded Sun Yat Sen on his death in 1925, conducted China's defence against Japanese invasion from 1937–45. Sun Yat Sen had attempted to found a democratic republic based on Western parliamentary democracy and in his famous *Testament* laid down the principles upon which the constitution of China should be based. In 1946, Sun Fo, the son of Sun Yat Sen, deplored the party's departure from the principles of social democracy and the welfare of the people in which his father had believed. Beginning as a movement largely inspired by Russia, the Kuomintang under Chiang Kai-shek degenerated into a reactionary and corrupt military oligarchy which, collapsing in 1949, was replaced by the Communist party, leaving Chiang and his followers to rule Formosa with American aid.

L

Lamaism, the religion of Tibet, which is to Tibetans the most genuine form of Buddhist orthodoxy, but to others a corrupt and primitive tyranny. Its beliefs and worship derive from the Mahayana form of Buddhism which was introduced into Tibet in 749 A.D. The emphasis laid by its founder on the necessity for self-discipline and conversion through meditation and the study of philosophy deteriorated into formal monasticism and ritualism. In Tibet, Mahayanian Buddhism came into contact with demon-worship which, as the original religion of the country, contaminated it to the Lamaistic form. The religion from its original unworldly form had by the 17th cent. become a form of civil government in which the Dalai Lama, as the reincarnated Buddha, was both king and high priest, a sort of pope and emperor rolled into one, who ruled despotically in both civil and religious affairs. Under him was a hierarchy of officials in which the lowest order was that of the monks who became as numerous as one man in every six or seven of the population. The main work carried out by this vast church-state was the collection of taxes to maintain the monasteries and other religious offices. When the Dalai Lama dies, his spirit is held to pass into the body of a new-born child, who is selected by a royal search party which allegedly recognises him by certain marks. Second in power to the Dalai Lama is the Panchen or Tashi Lama believed to be a reincarnation of Amitabha, another Buddha. The last Dalai Lama fled to India in 1959 when the Chinese entered his country and it remains to be seen what effects Chinese communism will have upon a land for so long secluded from strangers and whether the religion will survive the impact of dialectical materialism.

Latitudinarians, Anglican churchmen of exceedingly broad views (*e.g.*, bishops who would admit dissenters—*i.e.*, those rejecting the views or authority of the Established Church). Although still used today, the term applies especially to such eminent 17th cent. divines as Burnet, Hales, Tillotson, and Chillingworth.

Levellers, an English military-politico-religious party prominent in the Parliamentary Army about 1647 which stood for the rights of the people. *See* **Diggers**.

Liberalism. The Liberal Party is the successor to the Whigs (a nickname derived from *whiggamore* used in the 17th cent. for Scottish dissenters) of the 18th and 19th cent. Prior to the victory of the Labour Party in 1922, it was one of the two main British political parties. Liberals are moderately progressive in the sense that most appreciate the humanistic aspects of socialism while strongly disapproving of its policies of state control, and they dislike any form of monopoly, state-run or otherwise. In general, the Party advocates co-ownership in industry, electoral reform (proportional representation), protection of individual liberties, governmental reform, tax reform, strict measures against any form of monopoly, and entry to the Common Market.

Logical Positivism, a school of philosophy founded in Vienna in the 1920s by a group known as "the Vienna circle": their work was based on that of Ernst Mach, but dates in essentials as far back as Hume. Of the leaders of the group, Schlick was murdered by a student, Wittgenstein came to Britain, and Carnap went to America following the entry of the Nazis. Briefly the philosophy differs from all others in that, while most people have believed that a statement might be (*a*) true, or (*b*) false, logical positivists consider there to be a third category: a statement may be meaningless. There are only two types of statement which can be said to have meaning: (1) those which are tautological, *i.e.*, those in which the statement is merely a definition of the subject, such as "a triangle is a three-sided plane figure" ("triangle" and "three-sided plane figure" are the same thing); and (2) those which can be tested by sense experience. This definition of meaningfulness excludes a great deal of what has previously been thought to be the field of philosophy; in particular it excludes the possibility of metaphysics. Thus the question as to whether there is a God or whether free-will exists is strictly meaningless, for it is neither a tautological statement nor can it be tested by sense-experience.

Lollards, a body of Reformers who, under the leadership of Wyclif, were subjected to cruel persecution in the reign of Richard II. Sir John Oldcastle, a prominent Lollard, was burned at the stake.

Lutheranism. The Reformation had a long history before it became, under Luther and Calvin, an accepted fact. The mediaeval Church had held (as the Catholic Church holds today) that the sacraments were the indispensable means of salvation. Since these were exclusively administered by the clergy, any movement which attacked clerical abuses was forced by sheer necessity to deny the Church's exclusive control of the means of salvation, before it could become free from dependence on a corrupt priesthood. Hence the Albigenses and the Waldenses (*q.v.*), the followers of John Hus and Wyclif (*see* **Anticlericalism**), were bound to deny the authority of the Church and emphasise that of the Bible. Luther began his movement primarily in order to reform the Church from its gross abuses and the famous ninety-five theses nailed to the door of the Church at Wittenberg in 1517 were not primarily theological but moral complaints dealing with the actual behaviour of the clergy rather than Church beliefs. But unlike the earlier reformers, Luther had arrived at the right moment in history when economic individualism and the force of nationalism were bound, sooner or later, to cause the authorities in Germany to line up on his side. Thus he began with the support of the peasants who were genuinely shocked at the abuse of indulgences and other matters, but ended up by being supported by the noblemen who wanted to destroy the power of the pope over the German states and looked forward to confiscating the lands and property of the Church. When the peasants wanted the reform of actual economic abuses relating to the feudal system, Luther took the side of the nobles against them. The contemporary movement in Switzerland led by Ulrich Zwingli had no such secular support, and Zwingli was killed in 1531.

Martin Luther (1483–1546) was the son of a miner in Eisleben in Saxony, entered the order of Austin Friars in 1505, and later taught at the newly founded university of Wittenberg. After the publication of the theses the real issue

so far as the Church was concerned was whether he was willing or not to submit to the authority of his superiors: Luther refused to compromise with his conscience in the famous words: "Here I stand; I can do no other." In a further statement Luther recommended the formation of a German national church, the abolition of indulgences and other means whereby Rome obtained money from Germany, and an end to the celibacy of the clergy. For this he was naturally excommunicated. His teaching was based on the German translation of the Bible, but he was by no means a fundamentalist: *e.g.*, he denied that the Book of Hebrews was written by Paul, would have nothing to do with the Apocalypse, and regarded the letter of James as "an epistle of straw." The Scriptures were open to all and could be interpreted by private judgment enlightened by the Spirit of God. Like Calvin, Luther was a predestinarian and determinist, but he was also a conservative and soon became alarmed about the position taken by many extremists once the Reformation was under way. He had really wanted the Church to reform itself, but when he alienated Rome he had perforce to rely more and more on the secular powers which finally resulted in the state-church form which became pronounced in Prussia and later elsewhere. Whereas Calvin wished the Church to be at least the equal of the State and in some respects its superior, Luther's rebellion resulted in the reverse, a state-controlled episcopalianism. The modern Lutheran Church is most active in Germany, in Denmark, Iceland, Norway, Sweden, and Finland, where it is the established state church, and in the United States. *See* **Calvinism, Presbyterianism.**

M

Magic, a form of belief originating in very early days and based on the primitive's inability to distinguish between similarity and identity. The simplest example would perhaps be the fertility rites in which it is believed that a ceremony involving sexual relations between men and women will bring about fertility in the harvest. Or the idea that sticking pins in an image of an individual will bring about harm or even death to the real person. Magic is regarded by some as a form of early science in that man in his efforts to control Nature had recourse to magical practices when the only methods he knew had failed to bring the desired results. It filled a gap. By others magic is regarded as an elementary stage in the evolution of religion It can be said to have served a purpose there too. Yet magic differs from religion, however closely at times it may come to be related with it, in this important respect: religion depends upon a power *outside and beyond* human beings, whereas magic depends upon nothing but the casting of a spell or the performance of a ceremony—the result follows automatically. (We do well, as Dr. Margaret Murray reminds us, to keep in mind "that when anything regarded as out of the ordinary course of nature is brought about by human means it is called a miracle if the magician belongs to the beholder's own religion, but it is magic—often black magic—if the wizard belongs to another religion. In Grimm's words, 'Miracle is divine, Magic is devilish.'")

The idea that "like produces like" is at the roots of imitative magic, and it is interesting to note that in some languages (*e.g.*, Hebrew and Arabic) there is no word for "resembles" or "similar to." Hence one says "All thy garments are myrrh" instead of "are *like* myrrh." It follows that an event can be compelled by imitating it. One engages in swinging, not for pleasure, but to produce a wind as the swing does; ball games are played to get rainy weather because the black ball represents dark rain-clouds; other ball games, in which one attempts to catch the ball in a cup or hit it with a stick, represent the sexual act (as some gentlemen at Lords may be distressed to hear) and bring about fertility; in medicine up till a few centuries ago herbs were chosen to cure a disease because in some respects their leaves or other parts looked like the part of the body affected (*e.g.*, the common wildflower still known as "eyebright" was used in bathing the eyes because the flower looks like a tiny eye).

Traces of these beliefs are still found today in children's games and the spells accompanying them have turned into nursery rhymes: dolls are the images of deposed gods or idols; tug-of-war was formerly a sex-conflict with men pulling one end and women the other to bring about fertility; skittles when knocked down by a ball produced the thunder-noise necessary to produce rain. There is reason to believe that the oldest words known in English, relics of our prehistoric language, are "Ena, mena, mina, mo" of the nursery rhyme.

Divination is another aspect of magic and no general of the past would have gone to war without consulting his diviners who referred to animals' livers, how the sacred chickens ate, or the way ceremonially shot arrows fell. Even Cicero wrote a book on divination discussing the significance of dreams, premonitions, and the flight of birds, which revealed the purposes of the gods. If we find it difficult to make any distinction between diviners, priests, medicine-men, rain-makers, shamans, and witch-doctors of early societies we could perhaps say that they have crystallised out into priests, scientists, and humbugs of our own day. For it would appear that magic, like witchcraft, still exists today—not merely in the form of children's stories and fears, or grown-ups' enjoyment of creepy tales, belief in fortune-telling, omens, amulets, and our own half-embarrassed fear of walking under ladders—but as cults attracting many of those who ought to have more sense. *See* **Witchcraft.**

Malthusianism, the theory about population growth put forward by the Rev. Thomas Malthus (1766–1834) in *An Essay on Population* (1798). His three main propositions were: (1) "Population is necessarily limited by means of subsistence." (2) "Population invariably increases where means of subsistence increase, unless prevented by some very powerful and obvious checks." (3) "These checks, and the checks which repress the superior power of population, and keep its effects on a level with the means of subsistence, are all resolvable into moral restraint, vice and misery." In other words, no matter how great the food supply may become, human reproductive power will always adjust itself so that food will always be scarce in relation to population; the only means to deal with this is by "moral restraint" (*i.e.*, chastity or not marrying), "vice" (*i.e.*, birth-control methods), or misery (*i.e.*, starvation). More specifically, Malthus claimed that while food increases by arithmetical progression, population increases by geometrical progression.

It is true that these gloomy predictions did not take place in Malthus's time largely owing to the opening up of new areas of land outside Europe, the development of new techniques in agriculture, the growth of international trade to poorer areas, the increased knowledge of birth-control, and developments in medical science which reduced the misery he had predicted. Furthermore, we now know that as a society becomes industrialised its birth-rate tends to fall. Nevertheless there are very few scientists who are not perturbed by the growth in the world's population which has increased from about 465 million in 1650 to over 3,000 million today.

Manichaeism. The early Christian apologists who had not yet acquired an adequate knowledge of philosophy had little intellectual trouble in dealing with the heathen; their trouble arose when confronted with religions which had a philosophical basis. Thus Gnosticism (*q.v.*) caused them a good deal of concern, Neoplatonism (*see* God and Man) rather less, since it could never appeal to the masses, and Manichaeism considerable anxiety because it could appeal both to the philosopher and the masses. Mithraism (*q.v.*), the only other serious contendant, was troublesome for a different reason in that it was the religion of the Roman army and bore a close resemblance to Christianity itself.

Manichaeism was an Asiatic religion which developed from Zoroastrianism (*q.v.*) and shows the influence of Buddhism (*q.v.*) and Gnosticism (*q.v.*) being founded by Mani, a Persian, who was born in Babylonia, *c.* 216 A.D. Mani presented himself to Shapur I as the founder of a new religion which was to be to Babylonia what Buddhism was to India or Christianity to the West. His aspiration was to convert the East and he himself made no attempt to interfere directly with Christianity although he represented himself as the Paraclete (the Holy Ghost or "Comforter") and, like Jesus, had twelve disciples. His success in Persia aroused the fury of the Zoroastrian priests who objected to his reforming zeal towards their religion and in 276 Mani was taken prisoner and crucified.

Of Mani's complicated system little can be said here, save that it is based on the struggle of two eternal conflicting principles, God and matter, or light and darkness. Like the Albigenses (who followed much of this heresy) Mani divided the faithful into two classes: the "Perfect" who were to practise the most rigid asceticism, and the "Hearers" whose discipline was much less severe. After death the former went to heaven immediately, the latter reached it only through a kind of purgatory, and the unbelievers were doomed to hell. Although its founder had no intention of interfering with the West, after his death his followers soon spread the religion from Persia and Mesopotamia to India and China. (Manichaeism flourished in China until the 11th cent.) It reached as far as Spain and Gaul and influenced many of the bishops in Alexandria and in Carthage where for a time St. Augustine accepted Manichaeism. Soon the toleration accorded it under Constantine ended and it was treated as a heresy and violently suppressed. Yet it later influenced many heresies, including, as we have seen, the Albigenses, and it even had some influence on orthodox Catholicism which had a genius for picking up elements in other religions which had been shown to appeal to worshippers provided they did not conflict unduly with fundamental beliefs.

Maronites, a Roman Catholic community of Christians living in the Mount Lebanon region. Their secular clergy marry as in the Greek Church, but their bishops are celibate.

Marxism. The sociological theories founded by Karl Marx and Friedrich Engels on which modern communist thought is based. Marx and Engels lived in a period of unrestrained capitalism when exploitation and misery were the lot of the industrial working classes, and it was their humanitarianism and concern for social justice which inspired their work. They co-operated in 1848 in writing the *Communist Manifesto*, and in his great work, *Das Kapital* (1867), Marx worked out a new theory of society. He showed that all social systems are economically motivated and change as a result of technical and economic changes in methods of production. The driving force of social change Marx found to be in the struggle which the oppressed classes wage to secure a better future. Thus in his celebrated theory of historical materialism he interpreted history in terms of economics and explained the evolution of society in terms of class struggle. (*See* **Dialectical Materialism**). "In the social production of their means of existence," he wrote, "men enter into definite and unavoidable relations which are independent of their will. These productive relationships correspond to the particular stage in the development of their material productive forces." Marx's theory of historical materialism implies that history is propelled by class struggle with communism and the classless society as the final stage when man will have emancipated himself from the productive process. Marx was the first to put socialism on a rational and scientific basis, and he foretold that socialism would inevitably replace capitalism and that in the transition period the revolutionary dictatorship of the proletariat would be necessary. His prophecy, however, came to realisation not in the advanced countries as he had envisaged but in backward Russia and China. *See also* **The Social Effects of Technical Change, Section Q, Part II.**

Matriarchy, a theory in anthropology developed by Bachofen (*Das Mutterrecht*, 1861) and followed by the American Briffault (*The Mothers*, 1927) that society was originally a matriarchate with authority invested in women. The opinion of nearly all modern anthropologists, however, is against this view. Both historically and today a genuine matriarchate is nowhere to be found, although in a few places feminine prerogatives have evolved to a marked degree in various directions. Thus there are societies which are *matrilineal* (*i.e.*, where descent is traced through the mother's side) and it is quite possible that this used to be the general state of affairs since, at a time when man's part in reproduction was unclear, one could only be certain of the individual's mother. There are other societies in which residence is *matrilocal* (*i.e.*, where the married couple live in the home of the wife's family). But neither of these has any bearing on the issue of whether women ever *ruled* society. Furthermore, there are groups where women are physically stronger than men; where agriculture is primarily in their hands; where, as in the case of the famous bodyguard of the King of Dahomey, they are even soldiers; where men, rather than women, do the cooking or sewing. Yet the question of societies ruled by women either in the past or present may be ruled out: the subject is closed.

Mennonites. *See* **Baptists.**

Mensheviks. *See* **Bolshevism.**

Methodism, the religious movement founded by John Wesley in 1738, at a time when the Anglican Church was in one of its periodic phases of spiritual torpor, with the simple aim of spreading "scriptural holiness" throughout the land. Up to that time Wesley had been a High Churchman but on a visit to Georgia in the United States he was much impressed by the group known as Moravians (*q.v.*), and on his return to this country was introduced by his brother Charles, who had already become an adherent, to Peter Böhler, a Moravian minister in England. Passing through a period of spiritual commotion following the meeting, he first saw the light at a small service in Aldersgate in May 1738 "where one was reading Luther's preface to the Epistle to the Romans" and from this time forth all Wesley's energies were devoted to the single object of saving souls. He did this for fifty years and at the end of his life confessed that he had wasted fifteen minutes in that time by reading a worthless book. Even when he was over eighty he still rose at 4 a.m. and toiled all day long.

Soon Whitefield, a follower with Calvinist views, was preaching throughout the country and Charles Wesley was composing his well-known hymns; John's abilities at this time were taken up in organising the movement described as "People called Methodists." They were to be arranged in "societies" which were united into "circuits" under a minister, the circuits into "districts" and all knit together into a single body under a conference of ministers which has met annually since 1744. Local lay preachers were also employed and to maintain interest the ministers were moved from circuit to circuit each year. These chapel services were not originally meant to conflict with the Church of England of which Wesley still considered himself a member. They were purely supplementary, and it used to be the custom (before the Methodists began to count themselves as Nonconformists) for Methodists to attend Church in the morning and Chapel in the evening.

The class-meeting was the unit of the organisation where members met regularly under a chosen leader to tell their "experiences" upon which they were often subjected to severe cross-examination. At the end of every quarter, provided their attendances were regular, they received a ticket of membership which entitled them to come to monthly sacramental services. If attendance was inadequate the name was removed from the list, without appearance on which nobody was deemed a member. The price of the ticket was "a penny a week and a shilling a quarter" but Wesley was not interested in receiving money from anyone who was not utterly devoted to the cause.

John Wesley introduced four other innova-

tions, some of which were regarded by Churchmen who had previously been willing to commend his efforts in bringing religion to the poorer classes as dangerous: (1) He started the Sunday-school scheme and afterwards enthusiastically supported that of John Raikes, often regarded as the founder of the idea: this was of immense importance in the days before the Education Acts. (2) He reintroduced the Agapae or "love feasts" of the early Church which were fellowship meetings deepening the sense of brotherhood of the society. (3) He began to copy the open-air meetings of the eloquent Whitefield and soon unwittingly produced the most extraordinary results, finding that his sermons led to groans, tears, fainting-fits, and all sorts of emotional expression. Even his open-air lay speakers produced like results and these came to be associated with Methodism and gave significance to the proud Anglican claim that *their* services would be "without enthusiasm." (4) After some hesitation he ventured to consecrate Dr. Thomas Coke, who was being sent as a missionary to America, as a bishop of his church. In addition to Wesley's religious work he was a great educator of the common man. Thus he introduced the cheap book and the church magazine, publishing books of any sort which he thought would edify and not harm even when the views expressed were different from his own—*e.g.*, Thomas à Kempis's *Imitation of Christ* and works of history biography, science, and medicine in some cases written by himself. In this way the movement with its cheap books and reading rooms had an influence far beyond its actual membership. Both the Anglican Church and the Evangelical movement of Wilberforce and others profited from Wesley's work. Some social historians, rightly or wrongly, have claimed that it was Wesley's influence among the working classes that spared England the revolutionary activity which characterised most other European countries during the first quarter of the 19th cent.

Methodism, especially after Wesley's death in 1791, began, like other movements, to develop schisms. There were the long-standing differences which the Baptist movement (*q.v.*) had shown too between Arminian and Calvinist sections—*i.e.*, between those who did and those who did not accept the doctrine of predestination. In the case of the Methodists, this led to a complete break in 1811. Then there were differences associated with the status of the laity, or the relationship of the movement with the Anglican Church. The "Methodist New Connection" of 1797 differed only in giving the laity equal representation with the ministers but the more important break of the Primitive Methodists in 1810 gave still more power to the laity and reintroduced the "camp-meeting" type of service. In 1815 the Bryanites or "Bible Christians" were formed, and a further schism which was even brought before the law courts was ostensibly over the foundation of a theological college. The real reason, of course, was that the ministers were becoming more Tory, whilst the laity were becoming more Radical. Finally in 1932, at a conference in the Albert Hall in London, the Wesleyan Methodists, the Primitive Methodists, and the United Methodists became one Church, the Methodist Church. Including America, where Methodism under the original direction of Thomas Coke spread like wildfire, the Methodist is one of the largest Protestant Churches of today.

Mind and Matter.

Early Greek Views: Idealism and Dualism. Primitive peoples could see that there is a distinction between those things which move and do things by themselves and others, such as stones, which do not. Following the early state of Animism (*q.v.*), in which spirits were believed to have their abode in everything, they began to differentiate between matter or substance and a force which seems to move it and shape it into objects and things. Thus to the Greek Parmenides (fl. *c.* 475 B.C.), who was a philosopher of pure reason, thought or mind was the creator of what we observe and in some way not quite clear to himself it seemed that mind was the cause of everything. This is perhaps the first expression of the movement known as Idealism which says, in effect, that the whole universe is mental—a creation either of our own minds or the mind of God. But from Anaxagorus (488–428 B.C.) we have the clearer statement that mind or *nous* causes all movement but is distinct from the substance it moves. He does not, however, think in terms of individual minds but rather of a kind of generalised mind throughout the universe which can be used as an explanation of anything which cannot be explained otherwise. This is the position known as Dualism (*q.v.*) which holds that both mind and matter exist and interact but are separate entities.

Most people in practice are dualists since, rightly or wrongly, mind and body are thought of as two different things: it is the "common-sense" (although not necessarily the true) point of view. Plato in a much more complex way was also a dualist although he held that the world of matter we observe is in some sense not the genuine world. The real world is the world of ideas and the tree we see is not real but simply matter upon which mind or soul has imprinted the idea of a tree Everything that exists has its corresponding form in the world of ideas and imprints its pattern upon matter. Mind has always existed and, having become entangled with matter, is constantly seeking to free itself and return to God.

Plato's pupil Aristotle had a much more scientific outlook and held that, although it was mind which gave matter its form, mind is not *outside* matter, as Plato had thought, but *inside* it as its formative principle. Therefore there could be no mind without matter and no matter without mind: for even the lowest forms of matter have some degree of mind which increases in quantity and quality as we move up the scale to more complex things.

So far, nobody had explained how two such different substances as matter and mind could influence each other in any way, and this remains, in spite of attempts to be mentioned later, a basic problem in philosophy.

Two later ideas, one of them rather foolish and the other simply refusing to answer the question, are typified by the Stoics and some members of the Sceptic school. The first is that only matter exists and what we call mind is merely matter of a finer texture, a view which as an explanation is unlikely to satisfy anyone; the other, that of some Sceptics, is that we can know nothing except the fleeting images or thoughts that flicker through our consciousness. Of either mind or matter we know nothing.

Renaissance Attitude. Christian doctrines have already been dealt with (*see* God and Man, Determinism and Free-will), and the past and future of the soul is dealt with under Immortality. Nor need we mention the Renaissance philosophers who were really much more concerned about how to use mind than about its nature. When they did consider the subject they usually dealt with it, as did Francis Bacon, by separating the sphere of science from that of religion and giving the orthodox view of the latter because there were still good reasons for not wishing to annoy the Church.

17th-cent. Views: Hobbes, Descartes, Guelincx, Spinoza, Locke, Berkeley. Thomas Hobbes in the 17th cent. was really one of the first to attempt a modern explanation of mind and matter even if his attempt was crude. As a materialist he held that all that exists is matter and hence our thoughts, ideas, images, and actions are really a form of motion taking place within the brain and nerves. This is the materialist theory which states that mind does not exist.

Thus there are three basic theories of the nature of mind and body: idealism, dualism, and materialism, and we may accept any one of the three. But, if we accept dualism, we shall have to explain precisely the relationship between body and mind. In some of his later writings Hobbes seems to suggest that mental processes are the effects of motion rather than motion itself; *i.e.*, they exist, but only as a result of physical processes just as a flame does on a candle. This theory of the relationship is known as *epiphenomenalism*.

Descartes, the great French contemporary of

Hobbes, was a dualist who believed that mind and matter both exist and are entirely different entities; therefore he had to ask himself how, for example, the desire to walk leads to the physical motion of walking. His unsatisfactory answer was that, although animals are pure automatons, man is different in that he has a soul which resides in the pineal gland (a tiny structure in the brain which today we know to be a relic of evolution with no present function whatever). In this gland the mind comes in contact with the "vital spirits" of the body and thus there is interaction between the two. This theory is known as *interactionism*, and since we do not accept its basis in the function of the pineal gland, we are simply left with the notion of interaction but without the explanation of how it takes place.

One of Descartes's successors, Arnold Guelincx, produced the even more improbable theory of *psychophysical parallelism*, sometimes known as the theory of the "two clocks." Imagine you have two clocks, each keeping perfect time, then supposing you saw one and heard the other, every time one points to the hour the other will strike, giving the impression that the first event causes the second, although in fact they are quite unrelated. So it is with the body and mind in Guelincx's view, each is "wound up" by God in the beginning in such a way as to keep time with the other so that when I have the desire to walk purely unrelated physical events in my legs cause them to move at the same time. A variety of this theory is *occasionism*, which says that whenever something happens in the physical world, God affects us so that we *think* we are being affected by the happening.

The trouble about all these theories is (*a*) that they really explain nothing, and (*b*) that they give us a very peculiar view of God as a celestial showman treating us as puppets when it would surely have been easier to create a world in which mind and matter simply interacted by their very nature. Spinoza, too, believed in a sort of psychophysical parallelism in that he did not think that mind and body interacted. But since in his theory everything is God, mind and matter are simply two sides of the same penny.

John Locke, another contemporary, thought of the mind as a blank slate upon which the world writes in the form of sensations, for we have no innate or inborn ideas and mind and matter do interact although he does not tell us how. All we know are sensations—*i.e.*, sense impressions. Bishop Berkeley carried this idea to its logical conclusion: if we know nothing but sensations, we have no reason to suppose that matter exists at all. He was, therefore, an idealist.

18th cent. Views: Hume, Kant. David Hume went further still and pointed out that, if all we know are sensations, we cannot prove the existence of matter but we cannot prove the existence of mind either. All we can ever know is that ideas, impressions, thoughts, follow each other. We do not even experience a self or personality because every time we look into our "minds" all we really experience are thoughts and impressions. Hume was quick to point out that this was not the same as saying that the self did not exist; it only proved that we cannot know that it does.

Kant made it clear that, although there is a world outside ourselves, we can never know what it is really like. The mind receives impressions and forms them into patterns which conform not to the thing-in-itself but to the nature of mind. Space and time, for example, are not realities but only the form into which our mind fits its sensations. In other words our mind shapes impressions which are no more like the thing-in-itself than the map of a battlefield with pins showing the position of various army groups at any given moment is like the battlefield. This, of course, is true. From physics and physiology we know that the sounds we hear are "really" waves in the air, the sights we see "really" electromagnetic waves. What guarantee do we have that the source is "really" like the impression received in our brain? Kant was the leader of the great German Idealist movement of the 18th cent. which in effect said: "why bother about matter when all we can ever know is mental?"

19th and 20th cent. Views. The Englishman Bradley, and the Frenchman Henri Bergson in the 19th and early 20th cent. both held in one form or another the belief that mind in some way creates matter and were, therefore, idealists, whereas Comte, the positivist (*q.v.*), and the Americans William James and John Dewey, held that mind is a form of behaviour. Certain acts (*e.g.*, reflexes) are "mindless" because they are deliberate; others which are intended may be described for the sake of convenience as "minded" (*i.e.*, purposeful). But like the majority of modern psychologists—insofar as they take any interest in the subject—they regarded mind as a process going on in the living body. Is there any reason, many now ask, why we should think of mind as being any different in nature from digestion? Both are processes going on in the body, the one in the brain, the other in the stomach and intestines. Why should we regard them as "things"?

Mithraism, a sun-religion which originated in Persia with the worship of the mythical Mithra, the god of light and of truth. It was for two centuries one of early Christianity's most formidable rivals, particularly in the West since the more philosophical Hellenic Christianity of the East had little to fear from it. (Arnold Toynbee has described Mithraism as "a pre-Zoroastrian Iranian paganism—in a Hellenic dress"; Manichaeism as "Zoroastrianism—in a Christian dress".) Mithraism was a mystery-faith with secret rites known only to devotees. It appealed to the soldiers of the Roman Army which explains its spread to the farthest limits of the Roman empire and its decline as the Romans retreated. The religion resembled Zoroastrianism (*q.v.*) in that it laid stress on the constant struggle between good and evil and there are a number of parallels with Christianity, *e.g.*, a miraculous birth, death, and a glorious resurrection, a belief in heaven and hell and the immortality of the soul, a last judgment. Both religions held Sunday as the holy day of the week, celebrated 25 December (date of the pagan winter solstice festival) as the birthday of the founder; both celebrated Easter, and in their ceremonies made use of bell, holy water, and the candle. Mithraism reached its height about 275 A.D. and afterwards declined both for the reason given above and, perhaps, because it excluded women, was emotional rather than philosophical, and had no general organisation to direct its course. Yet even today, from the Euphrates to the Tyne, traces of the religion remain and antiquarians are familiar with the image of the sun-god and the inscription *Deo Soli Mithrae, Invicto, Seculari* (dedicated to the sun-god of Mithra, the unconquered).

Mohammedanism. See Islam.

Monasticism. When in the 4th cent. A.D. Constantine in effect united state and church there were naturally many who hastened to become Christians for the worldly benefits they expected it to bring in view of the new situation. But there were others who, in their efforts to escape from worldly involvement, went into the deserts of North Africa and Syria to live as hermits and so in these regions there grew up large communities of monks whose lives of renunciation made a considerable impression on the Christian world. They were men of all types but the two main groups were those who preferred to live alone and those who preferred a community life. Among the first must be included St. Anthony, the earliest of the hermits, who was born in Egypt *c.* 250 and who lived alone in a hut near his home for fifteen years, and then in the desert for a further twenty. As his fame spread Anthony came forth to teach and advocate a life of extreme austerity, until by the end of his life the Thebaid (the desert around Thebes) was full of hermits following his example. (Not unnaturally, he was constantly assailed by lustful visions which he thoughtfully attributed to Satan.) In the Syrian desert St. Simeon Stylites and others were stimulated to even greater austerities and Simeon himself spent many years on the top of a pillar in a space so small that it was only possible to sit or stand.

With some of these men it is obvious that ascetic discipline had become perverted into an unpleasant form of exhibitionism.

The first monastery was founded by Pachomius of Egypt c. 315 and here the monks had a common life with communal meals worship, and work mainly of an agricultural type. In the Eastern part of the Empire St. Basil (c. 360) tried to check the growth of the extreme and spectacular practices of the hermits by organising monasteries in which the ascetic disciplines of fasting, meditation, and prayer, would be balanced by useful and healthy activities. His monasteries had orphanages and schools for boys—not only those who were intended for a monkish life. But the Eastern Church in general continued to favour the hermit life and ascetic extremes. Originally a spontaneous movement, the monastic life was introduced to the West by St. Athanasius in 339 who obtained its recognition from the Church of Rome and St. Augustine introduced it into North Africa beyond Egypt. The movement was promoted also by St. Jerome, St. Martin of Tours, who introduced it into France, and St. Patrick into Ireland. The monastery of Iona was founded by St. Columba in 566. But it must be remembered that the Celtic Church had a life of its own which owed more to the Egyptian tradition than to Rome. Unlike the more elaborate monasteries of the continent those of the early Celtic Church were often little more than a cluster of stone bee-hive huts, an oratory, and a stone cross. It had its own religious ceremonies and its own art (notably its beautifully carved crosses and the illuminated manuscripts such as the Lindisfarne Gospel (c. 700) and the Irish Book of Kells dating from about the same time). The Scottish St. Ninian played a major part in introducing Egyptian texts and art to Britain where, mixed with Byzantine influences and the art of the Vikings, it produced a typical culture of its own. Strangely enough, it was the relatively primitive Celts who played almost as large a part in preserving civilisation in Europe during the Dark Ages as did the Italians since. It was St. Columbanus (c. 540–615) who founded the great monasteries of Annegray, Luxeuil, and Fontaine in the Vosges country, St. Gall in Switzerland, and Bobbio in the Apennines. So, too, it was the Anglo-Saxon Alcuin (c. 735–804) who was called from York by Charlemagne to set up a system of education throughout his empire; the most famous of the monastic schools he founded was at Tours. Among those influenced by him was the philosopher John Scotus Erigena.

Meanwhile from the south, as the disintegrating Roman empire became increasingly corrupt, St. Benedict of Nursia (c. 480–c. 543) fled the pleasures of Rome to lead a hermit's life near Subiaco. Here he founded some small monasteries, but c. 520 made a new settlement, the great monastery of Monte Cassino in southern Italy, where he established a "Rule" for the government of monks. This included both study and work and emphasised that education was necessary for the continuance of Christianity. As his influence spread his Rule was adopted by other monasteries, and schools became part of monastic life. It is not possible to describe the many different orders of monks and nuns formed since, nor the mendicant orders of friars (*e.g.*, Franciscans, Dominicans, Carmelites, Augustinians). In many ways even those outside the Roman Catholic Church owe much to the monastic movement. Monasticism, of course, is not peculiar to Christianity and forms a major aspect of Buddhism, especially in the form of Lamaism in Tibet (*q.v.*).

Monophysitism, a heresy of the 5th cent. which grew out of a reaction against Nestorianism (*q.v.*). The majority of Egyptian Christians were Monophysites (Mono-physite = one nature)—*i.e.*, they declared Christ's human and divine nature to be one and the same. This view was condemned at the Council of Chalcedon (A.D. 451) which pronounced that Jesus Christ, true God and true man, has two natures, at once perfectly distinct and inseparably joined in one person and partaking of the one divine substance. However, many continued to hold Monophysite opinions, including the Coptic Church (*q.v.*), declaring the Council to be unoecumenical (*i.e.*, not holding the views of the true and universal Christian Church).

Monopsychism, the theory of the intellect held by the Arab philosopher Averroës (1126–98) in his interpretation of Aristotle, maintaining that the individual intelligence has no existence in its own right but is part of the divine mind (*nous*) from which it emerges at birth and into which it is absorbed at death. He thus denied personal immortality, a view which was opposed by Christian philosophers.

Monothelites, a Christian sect of the 7th cent. which attempted to reconcile Monophysitism with orthodoxy. They admitted the orthodox view of Christ's two natures as God and man, but declared that He operated with one will. Monothelitism was condemned as heretical by the Council of Constantinople in 680 A.D.

Montanism, a Phrygian form of primitive Puritanism with many peculiar tenets into which the early Christian theologian Tertullian (c. 150–c. 230) was driven by his extremist views that the Christian should keep himself aloof from the world and hold no social intercourse whatever with pagans. The sect had immediate expectation of Christ's second coming and indulged in prophetic utterance which they held to be inspired by the Holy Ghost but which their enemies put down to prompting by the Devil. In seeking persecution and martyrdom they antagonised the Church and were suppressed.

Moral Re-Armament, a campaign launched in 1938 by an American evangelist of Lutheran background, Frank N. D. Buchman (1878–1961), founder of the Oxford Group Movement, and at first associated with the First Century Church Fellowship, a fundamentalist Protestant revivalist movement. On a visit to England in 1920 Buchman preached "world-changing through life-changing" to undergraduates at Oxford, hence the name Oxford Group. This revivalist movement was based on Buchman's conviction that world civilisation was breaking down and a change had to be effected in the minds of men.

Two of the Group's most typical practices were group confession of sins openly and the "quiet time" set aside during the day to receive messages from the Almighty as to behaviour and current problems. In the eyes of non-Groupers the confession (often of trivial sins) appeared to be exhibitionist and there was felt to be a certain snobbery about the movement which made it strongly conscious of the social status of its converts.

The Oxford Group gave way to Moral Re-Armament, the third phase of Buchmanism. M.R.A. men and women lay stress on the four moral absolutes of honesty, purity, love, and unselfishness. They believe they have the ideas to set the pattern for the changing world and, indeed, claim to have aided in solving many international disputes—political, industrial, and racial. Theologians complained of the Groups that their movement lacked doctrine and intellectual content; M.R.A. is no different in this respect. Conference centres are at Caux, Switzerland, Mackinac Island, Michigan, U.S.A., and Odawara, Japan.

Moravian Church, a revival of the Church of the "Bohemian Brethren" which originated (1457) among some of the followers of John Hus. It developed a kind of Quakerism that rejected the use of force, refused to take oaths, and had no hierarchy. It appears to have been sympathetic towards Calvinism but made unsuccessful approaches to Luther. As a Protestant sect it was ruthlessly persecuted by Ferdinand II and barely managed to survive. However, in the 18th cent. the body was re-established by Count Zinzendorf who offered it a place of safety in Saxony where a town called Herrnhut (God's protection) was built and this became the centre from which Moravian doctrine was spread by missionaries all over the world. Their chief belief (which had a fundamental influence on John Wesley—*see* **Methodism**) was that faith is a direct illumination from God which assures us beyond all possibility of doubt that we are saved, and that no goodness of behaviour, piety, or orthodoxy is of any use without this "sufficient, sovereign, saving grace."

Mormons, or Latter-day Saints, one of the very numerous American religious sects; founded in 1830 by Joseph Smith, the son of a Vermont farmer, who, as a youth, had been influenced by a local religious revival though confused by the conflicting beliefs of the various denominations. He said that while praying for guidance he had been confronted by two heavenly messengers who forbade him to join any existing church but prepare to become the prophet of a new one. Soon, in a series of visions, he was told of a revelation written on golden plates concealed in a nearby hillside. These he unearthed in 1827 and with the help of "Urim and Thummim" translated the "reformed Egyptian" characters into English. Described as the *Book of Mormon*, this was published in 1830 and at the same time a little church of those few who accepted his testimony was founded in Fayette, N.Y. In addition the first of Joseph Smith's "miracles"—the casting out of a devil—was performed. The *Book of Mormon* purports to be a record of early American history and religion, the American Indians being identified as the ten Lost Tribes of Israel, whose fate has never failed to attract the attention of those who prefer myth to fact (cf. British Israelites). Jesus Christ is alleged to have appeared in America after His ascension. Yet Smith's eloquence was able to influence quite educated people, including Sidney Rigdon with whom he went into business for a time. *Doctrine and Covenants* is the title of another book dealing with the revelations Smith claimed to have received. Soon the sect was in trouble with the community both because its members insisted on describing themselves as the Chosen People and others as Gentiles and because they took part in politics, voting as Smith ordered them to. Smith was constantly in trouble with the police. Therefore they were turned out from one city after another until they found themselves a dwelling-place at Nauvoo, Illinois, on the Mississippi.

That would probably have been the end of the story had not Smith been murdered in 1844 and thereby made to appear a martyr, and had there not appeared Brigham Young, a quite extraordinary leader, who stamped out warring factions and drove out the recalcitrant. While persecutions continued Brigham Young announced that it had been revealed that he must lead the faithful to Salt Lake, then outside the area of the United States. There followed the famous trek of more than a thousand miles across desert country in which he led the way, reaching his journey's end in the forbidding valley of the Great Salt Lake on 24 July 1847. By 1851 30,000 Mormons had reached the Promised Land. Here they held their own in a hostile environment and under the practical genius of their leader carried through a vast irrigation scheme and built Salt Lake City which still serves as the headquarters of their sect. In 1850 their pioneer settlement was made Utah Territory, and in 1896 incorporated in the Union. The church was strictly ruled by its leader who also looked after affairs of state for thirty years until his death in 1877.

Polygamy, although opposed by some Mormons, and only sanctioned by Brigham Young when Salt Lake City had been built, is the best-known of Mormon doctrines. It brought the sect into much disrepute and was renounced in 1890. Mormons are millenarians, believing that some time Christ will appear and rule for a thousand years. They perform ritual ceremonies which take the form of a kind of morality play with such actors as God and Satan, Adam and Eve, and there are ablutions, hand-claspings, and anointings. "Miracles" are still performed, for the church has recovered all the powers possessed by the early church. The Old Testament was intended for the Jewish Dispensation, the New for the Christian, but the *Book of Mormon* and the *Doctrine* are for the true church—although all are equally inspired.

There are two orders of priests or leaders: the Melchizedeks, or higher order, include the apostles or ruling elders, and the high priest; the Aaronic priesthood, or lower order, attends to the temporal affairs of the church as the Melchizedeks attend to the spiritual. Members abstain from alcohol, tobacco, coffee, and tea. The church lays stress on the importance of revelation through visions, on education to meet the social, spiritual, and cultural needs of its members, and on community welfare. Members of the Church of Jesus Christ of Latter-day Saints now number over two million in congregations throughout the world.

The Reorganised Church of Jesus Christ of Latter-day Saints with its headquarters at Independence, Missouri, has been separate and distinct since 1852.

Muggletonians, one of the many sects which arose during the Commonwealth but, unlike most of the others (**Levellers** (*q.v.*), **Diggers** (*q.v.*, Fifth-Monarchy Men, and the Millenarians) which tended to have a strongly political aspect, this was purely religious. Founded by two journeymen tailors, Lodowick Muggleton and John Reeve, who interpreted the Book of Revelation in their own peculiar way, it was decided that Reeve represented Moses, and Muggleton, Aaron. They also believed that the Father, not the Son, had died on the cross (an ancient heresy) but added the strange statement that He left Elijah in control during His period on earth. Rejecting the doctrine of the Trinity, they also asserted that God has a human body. Nevertheless, for a time, they had a large number of followers.

Mysticism, a religious attitude which concerns itself with direct relationship with God, "reality" as contrasted with appearance or the "ultimate" in one form or another. All the higher religions have had their mystics who have not always been regarded without suspicion by their more orthodox members, and, as Bertrand Russell points out, there has been a remarkable unity of opinion among mystics which almost transcends their religious differences. Thus, characteristic of the mystical experience in general, have been the following features: (1) a belief in insight as opposed to analytical knowledge which is accompanied in the actual experience by the sense of a mystery unveiled, a hidden wisdom become certain beyond the possibility of doubt; this is often preceded by a period of utter hopelessness and isolation described as "the dark night of the soul"; (2) a belief in unity and a refusal to admit opposition or division anywhere; this sometimes appears in the form of what seem to be contradictory statements: "the way up and the way down is one and the same" (Heraclitus). There is no distinction between subject and object, the act of perception and the thing perceived; (3) a denial of the reality of time, since if all is one the distinction of past and future must be illusory; (4) a denial of the reality of evil (which does not maintain, *e.g.*, that cruelty is good but that it does not exist in the world of reality as opposed to the world of phantoms from which we are liberated by the insight of the vision). Among the great mystics have been Meister Eckhart and Jakob Boehme, the German religious mystics of the 13th and 16th cent. respectively, Acharya Sankara of India, and St. Theresa and St. John of the Cross of Spain. Mystical movements within the great religions have been: the Zen (*q.v.*) movement within Buddhism; Taoism in China; the Cabalists and Hasidim in Judaism; the Sufis within Islam; some of the Quakers within Christianity.

Mystery Religions. *See* **Orphism.**

N

Nancy School of Psychotherapy. Before Freud, the only satisfactory means of treating neurosis psychologically was hypnosis (used for centuries in one form or another, but rediscovered by Anton Mesmer (1733–1815), hence the name). Also at that time the commonest neurosis was hysteria—a condition in which physical disease is mimicked unconsciously by the production of such symptoms as paralysis, loss of memory, areas of pain, or loss of feeling, even deafness and blindness. This condition was discovered by Ambrose Liébeault of Nancy in Lorraine to be particularly susceptible to treatment by hypnosis (which, unlike Mesmer who was somewhat

of a charlatan, he used in a scientific way). Liébeault (1823–1904) and his colleague Hippolyte Bernheim (1840–1919) believed: (*a*) that hysteria was produced by suggestion and particularly by autosuggestion on the part of the patient; and (*b*) that suggestion was a normal trait found in varying degrees in everyone. These conclusions are true, but as Freud showed later, are far from being the whole truth. *See* **Paris School of Psychotherapy.**

Natural Law, the specifically Roman Catholic doctrine that there is a natural moral law, irrespective of time and place, which man can know through his own reason. Originally a product of early rational philosophy the Christian form of the doctrine is basically due to St. Thomas Aquinas who defined natural law in relation to eternal law, holding that the eternal law is God's reason which governs the relations of all things in the universe to each other. The natural law is that part of the eternal law which relates to man's behaviour. Catholic natural law assumes that the human reason is capable of deriving ultimate rules for right behaviour since there are in man and his institutions certain stable structures produced by God's reason which man's reason can know to be correct and true. Thus, the basis of marriage, property, the state, and the contents of justice are held to be available to man's natural reason. The rules of positive morality and civil law are held to be valid only insofar as they conform to the natural law, which man is not only capable of knowing but also of obeying.

Protestant theologians criticise this notion. Thus Karl Barth and many others hold that sinful and fallen man cannot have any direct knowledge of God or His reason or will without the aid of revelation. Another theologian Niebuhr points out that the principles of the doctrines are too inflexible and that although they are the product of a particular time and circumstance, they are regarded as if they were absolute and eternal. In fact, as most social scientists would also agree, there is no law which can be regarded as "natural" for all men at all times. Nor does it seem sensible to suppose that all or even many men possess either the reason to discern natural law or the ability to obey it; whether or not we accept man's free-will (and all Protestant sects do not), we know as a fact of science that people are not always fully responsible for their actions and some not at all.

Nazism, the term commonly used for the political and social ideology of the German National Socialist Party inspired and led by Hitler. The term *Nazi* was an abbreviation of National Socialist. Those in the Federal Republic today sympathetic to National Socialist aims are known as neo-Nazis. *See* **Fascism.**

Neoplatonism. *See* **Determinism and Free-will** and **God and Man.**

Nestorian heresy. The 5th cent. of the Christian Church saw a battle of personalities and opinions waged with fanatical fury between St. Cyril the patriarch of Alexandria, and Nestorius, patriarch of Constantinople. Nestorius maintained that Mary should not be called the mother of God, as she was only the mother of the human and not of the divine nature of Jesus. This view was contradicted by Cyril (one of the most unpleasant saints who ever lived) who held the orthodox view. In addition to his utter destruction of Nestorius by stealthy and unremitting animosity Cyril was also responsible for the lynching of Hypatia, a distinguished mathematician and saintly woman, head of the Neoplatonist school at Alexandria. She was dragged from her chariot, stripped naked, butchered and torn to pieces in the church, and her remains burned. As if this were not enough Cyril took pains to stir up pogroms against the very large Jewish colony of Alexandria. At the Council of Ephesus (A.D. 431) the Western bishops quickly decided for Cyril. This Council (reinforced by the Council of Chalcedon in 451) clarified orthodox Catholic doctrine (*see* **Monophysitism**). Nestorius became a heretic, was banished to Antioch where he had a short respite of peace, but later, and in spite of his weakness and age, was dragged about from one place to another on the borders of Egypt. We are assured that his tongue was eaten by worms in punishment for the wicked words he had spoken, but later the Nestorian church flourished in Syria and Persia under the protection of the rulers of Persia and missions were sent to India and China.

Nihilism, the name commonly given to the earliest Russian form of revolutionary anarchism. It originated in the early years of Tsar Alexander II (1818–81), the liberator of the serfs, who, during his attempts to bring about a constitutional monarchy, was killed by a bomb. The term "nihilist," however, was first used in 1862 by Turgenev in his novel *Fathers and Children*. *See* **Anarchism.**

Nominalism. Early mediaeval thinkers were divided into two schools, those who regarded "universals" or abstract concepts as mere names without any corresponding realities (Nominalists), and those who held the opposite doctrine (Realism) that general concepts have an existence independent of individual things. The relation between universals and particulars was a subject of philosophical dispute all through the Middle Ages.

The first person to hold the nominalist doctrine was probably [illegible]elin or Roscellinus in the late 11th cent., [illegible]; very little is known of him and none of his [illegible]s remains except for a single letter to Peter Ab[illegible]ard who was his pupil. Roscelin was born in [illegible]ance, accused twice of heresy but recanted [illegible] fled to England where he attacked the views of Anselm, according to whom Roscelin used the phrase that universals were a *flatus voci* or breath of the voice. The most important nominalist was the Englishman William of Occam in the 13th cent. who, once and for all, separated the two schools by saying in effect that science is about things (the nominalist view), whereas logic, philosophy, and religion are about terms or concepts (the Platonic tradition). Both are justified, but we must distinguish between them. The proposition "man is a species" is not a proposition of logic or philosophy but a scientific statement since we cannot say whether it is true or false without knowing about man. If we fail to realise that words are conventional signs and that it is important to decide whether or not they have a meaning and refer to something, then we shall fall into logical fallacies of the type: "Man is a species, Socrates is a man, therefore Socrates is a species." This, in effect, is the beginning of the modern philosophy of logical analysis which, to oversimplify, tells us that a statement is not just true or untrue, it may also be meaningless. Therefore, in all the philosophical problems we have discussed elsewhere, there is the third possibility that the problem we are discussing has no meaning because the words refer to nothing and we must ask ourselves before going any further "what do we mean by God," has the word "free-will" any definite meaning?

Nonconformism, the attitude of all those Christian bodies which do not conform to the doctrines of the Church of England. Up to the passing of the Act of Uniformity in 1662 they were called "puritans" or "dissenters" and were often persecuted. The oldest bodies of nonconformists are the Baptists, Independents, and (in England) the Presbyterians; the Methodists, although dating from 1738, did not consider themselves nonconformists until some time later. The Presbyterians are, of course, the official Church of Scotland where it is the Anglicans (known as "Episcopalians") who are the nonconformists, although not generally described as such.

Occam's Razor, the philosophical maxim by which William of Occam, the 13th cent. nominalist (*q.v.*), has become best-known. This states in the form which is most familiar: "Entities are not to be multiplied without necessity" and as such does not appear in his works. He did, however, say something much to the same effect: "It is vain to do with more what can be done with fewer." In other words, if everything in some science can be interpreted without

assuming this or that hypothetical entity, there is no ground for assuming it. This is Bertrand Russell's version, and he adds: "I have myself found this a most fruitful principle in logical analysis."

Occultism. *See* Magic, Alchemy, Astrology, and Theosophy.

Orangemen, members of an Irish society formed in Ulster in 1795 to uphold Protestantism. Their name is taken from King William III, Prince of Orange, who defeated James II at the Battle of the Boyne (1690), hence the enormous banners depicting "King Billy on the Boyne" and such other subjects or mottoes as appeal to the primitive mind when they are carried in procession on 12 July each year. The society has branches in many English-speaking countries but flourishes chiefly in Ulster.

Origenists, a sect of early religionists led by the Christian Father Origen in the 3rd cent., who accepted in general the doctrines of Plotinus (*see* Neoplatonism). They believed that men's souls are created before their bodies and are striving to enter bodies as they are born. When the soul leaves the body it enters another body if it has been sinful since justice requires punishment; but the punishment happens naturally through the driving power of the sinner's own errors. The celestial bodies are believed also to have souls, and it is asserted that Christ was the Son of God only by adoption and grace. The Council of Constantinople in 553 condemned Origen's doctrines.

Orphism. The Greeks in general thought very little of their gods, regarding them as similar to human beings with human failings and virtues although on a larger scale. But there was another aspect of Greek religion which was passionate, ecstatic, and secret, dealing with the worship of various figures among whom were Bacchus or Dionysus, Orpheus, and Demeter and Persephone of the Eleusinian Mysteries. Dionysus (or Bacchus) was originally a god from Thrace where the people were primitive farmers naturally interested in fertility cults. Dionysus was the god of fertility who only later came to be associated with wine and the divine madness it produces. He assumed the form of a man or a bull and his worship by the time it arrived in Greece became associated with women (as was the case in most of the Mystery Religions) who spent nights on the hills dancing and possibly drinking wine in order to stimulate ecstasy; an unpleasant aspect of the cult was the tearing to pieces of wild animals whose flesh was eaten raw. Although the cult was disapproved of by the orthodox and, needless to say, by husbands, it existed for a long time. This primitive and savage religion in time was modified by that attributed to Orpheus whose cult was more spiritualised, ascetic, and substituted mental for physical intoxication. Orpheus may have been a real person or a legendary hero and he, too, is supposed to have come from Thrace, but his name indicates that he, or the movement associated with him, came from Crete and originally from Egypt, which seems to have been the source of many of its doctrines. Crete, it must be remembered, was the island through which Egypt influenced Greece in other respects. Orpheus is said to have been a reformer who was torn to pieces by the Maenad worshippers of Dionysus. The Orphics believed in the transmigration of souls and that the soul after death might obtain either eternal bliss or temporary or permanent torment according to its way of life upon earth. They held ceremonies of purification and the more orthodox abstained from animal food except on special occasions when it was eaten ritually. Man is partly earthly, partly heavenly, and a good life increases the heavenly part so that, in the end, he may become one with Bacchus and be called a "Bacchus." The religion had an elaborate theology (*see* Section H, 117–128). As the Bacchic rites were reformed by Orpheus, so the Orphic rites were reformed by Pythagoras (*c.* 582–*c.* 507 B.C.) who introduced the mystical element into Greek philosophy which reached its heights in Plato. Other elements entered Greek life from Orphism. One of these was feminism which was notably lacking in Greek civilisation outside the Mystery Religions. The other was the drama which arose from the rites of Dionysus. The mysteries of Eleusis formed the most sacred part of the Athenian state religion, and it is clear that they had to do with fertility rites also, for they were in honour of Demeter and Persephone and all the myths speak of them as being associated with the supply of corn to the country (*see* Section H, 110–116). Without being provocative, it is accepted by most anthropologists and many theologians that Christianity, just as it accepted elements of Gnosticism and Mithraism, accepted elements from the Mystery Religions as they in turn must have done from earlier cults. The miraculous birth, the death and resurrection, the sacramental feast of bread and wine, symbolising the eating of the flesh and drinking of the blood of the god, all these are common elements in early religions and not just in one. None of this means that what we are told about Jesus is not true, but it surely does mean: (*a*) that Christianity was not a sudden development but had its predecessors; (*b*) that the early Church absorbed many of the elements of other religions; (*c*) that perhaps Jesus Himself made use of certain symbols which He knew had a timeless significance for man and invested them with new meaning.

Orthodox Eastern Church. There are two groups of Eastern churches: (1) those forming the Orthodox Church dealt with here which include the ancient Byzantine patriarchates of Constantinople, Alexandria, Antioch, and Jerusalem, and the national churches of Russia, Greece, Yugoslavia, Bulgaria, Rumania, etc. (although Orthodox communities exist all over the world and are no longer confined to geographical areas); (2) the churches which rejected Byzantine orthodoxy during various controversies from the 5th to the 7th cent., notably the Coptic church (*q.v.*) and the Armenian church. Although all Orthodox churches share the same doctrine and traditions they are arranged as national independent bodies each with its own hierarchy. They do not recognise the pope, and the primacy of the patriarch of Constantinople is largely an honorary one. Although claiming to be the One Holy, Catholic, and Apostolic Church its alleged infallibility rests on universal agreement rather than on any one individual, and agreement over the faith comes from the Scriptures interpreted in the light of the Tradition. The latter includes dogmas relating to the Trinity, Christology, Mariology, and Holy Icons; the testimony of the Fathers (St. Athanasius, St. Basil, St. John Chrysostom, St. Cyril of Alexandria, etc.); the canons or rules as formulated by the Councils and the Fathers. The Orthodox Church did not take part in the great Western controversies about the Bible, nor, of course, in the Reformation. Attempts have recently been made to improve relations between Rome and Constantinople: the two Churches agreed in 1965 to retract the excommunications cast on each other in A.D. 1054, which formalised the Great Schism.

P

Pantheism. *See* God and Man.

Papal Infallibility. The basis of papal infallibility is (*a*) that every question of morals and faith is not dealt with in the Bible so it is necessary that there should be a sure court of appeal in case of doubt, and this was provided by Christ when he established the Church as His Teaching Authority upon earth; (*b*) ultimately this idea of the teaching function of the Church shapes the idea of papal infallibility which asserts that the pope, when speaking officially on matters of faith or morals, is protected by God against the possibility of error. The doctrine was proclaimed in July 1870.

Infallibility is a strictly limited gift which does not mean that the pope has extraordinary intelligence, that God helps him to find the answer to every conceivable question, or that Catholics have to accept the pope's views on politics. He can make mistakes or fall into sin.

his scientific or historical opinions may be quite wrong, he may write books that are full of errors. Only in two limited spheres is he infallible and in these only when he speaks officially as the supreme teacher and lawgiver of the Church, defining a doctrine that must be accepted by all its members. When, after studying a problem of faith or morals as carefully as possible, and with all available help from expert consultants, he emerges with the Church's answer—on these occasions it is not strictly an answer, it is *the* answer. The world is waiting for a clear directive on the issue of birth control.

Historically speaking, the Roman Catholic Church of the early 19th cent. was at its lowest ebb of power. Pope Pius IX, in fear of Italian nationalism, revealed his reactionary attitude by the feverish declaration of new dogmas, the canonisation of new saints, the denunciation of all modern ideals in the Syllabus of Errors, and the unqualified defence of his temporal power against the threat of Garibaldi. It is not too much to say that everything regarded as important by freedom-loving and democratic people was opposed by the papacy at that time. In 1870, after a long and sordid struggle, the Vatican Council, convened by Pius IX, pronounced the definition of his infallibility. Döllinger, a German priest and famous historian of the Church, was excommunicated because, like many others, he refused to accept the new dogma. It is difficult not to doubt that there was some connection between the pronouncement of the pope's infallibility and his simultaneous loss of temporal power.

Paris School of Psychotherapy. The Paris school is important because it was the school of the famous French neurologist Jean Charcot (1825–93), teacher of Sigmund Freud (1856–1939) and Pierre Janet (1859–1947). At a time when hypnosis and the neurosis known as hysteria were very much "in the air," and Liébeault and his colleagues (*see* **Nancy School**) were regarding hysteria as a condition which was produced by autosuggestion, Charcot was maintaining the opposite view. Hypnosis, or the ability to be hypnotised, was, in his view, a symptom of a hysterical personality, and hysteria had a physiological basis.

Charcot was a highly controversial figure and his demonstrations were famous, if to some verging on the notorious; he aroused much antagonism among Roman Catholics by stating that faith cures at Lourdes were actually cases of hysteria and not, therefore, miraculous since they could equally well be cured by himself. However, he regarded hysteria as a sign of hereditary degeneration. His supposed words: "You will always find sex at the root of the trouble" and his pupil Janet's evidence that forgotten (or, as we should now say, repressed) traumatic events lay behind the symptoms which would go when the event was allowed expression, had a potent influence on the young Freud who made the uncovering of the past and the importance of sex the foundations of psychoanalysis (*see* **Section F, Part III**). Janet's belief was that hysteria is due to dissociation or imperfect integration of the personality. Modern belief is that Charcot was wrong about the physical basis of hysteria, wrong about the pathological significance of hypnosis, but right on the whole about the importance of sexual problems in neurosis.

Parsees. *See* **Zoroastrianism**

Paulicians, a Christian heretical sect which derives its name not from Paul the Apostle but from Paul of Samosata who was patriarch of Antioch, 260–72. His followers, the "Pauliani," were condemned for their "Adoptionist" (*q.v.*) attitude by the Council of Nicaea (325). Originally wide-spread in Anatolia, especially in Armenia from the 5th cent. onwards, they were cruelly persecuted by the Byzantine emperors and were deported (*c.* 755) to the Balkans to garrison that part of the East Roman empire. Elsewhere in this section the Albigenses or Cathari are mentioned; the Paulicians form part of their spiritual ancestry. It is debatable whether the "Adoptionist" doctrines professed by the Albigenses came from the Balkan Bogomils, through the Crusaders, or from the north of Spain, where there was an "Adoptionist" movement in the late part of the 8th cent. The evidence seems to be in favour of the Balkan influence but it should be noted that although the Bogomils were influenced by the Paulicians and the Manichaeans, the Paulicians themselves repudiated Manichaeanism. An authentic liturgical book of the Paulicians—*The Key of Truth*—was discovered in 1891 in Echmiadzin where the Armenian historical archives were kept. This manuscript throws new light on the heresy.

Pavlovian theory. *See* **Behaviourism.**

Pelagian heresy. *See* **Determinism and Free-will.**

Peripatetic philosophers, a name given to the followers of Aristotle derived from the philosopher's habit of walking up and down as he expounded his theories.

Phrenology, a psychological "school" founded in 1800 by two Germans, Franz Josef Gall and Johann Gaspar Spurzheim. Gall was an anatomist who believed there to be some correspondence between mental faculties and the shape of the head. He tested these ideas in prisons and mental hospitals and began to lecture on his findings, arousing a great deal of interest throughout both Europe and America, where his doctrines were widely accepted. Phrenology became fashionable, and people would go to "have their bumps read" as later men and women of fashion have gone to be psychoanalysed. Roughly speaking, Gall divided the mind into thirty-seven faculties such as destructiveness, suavity, self-esteem, conscientiousness, and so on, and claimed that each of these was located in a definite area of the brain. He further claimed that the areas in the brain corresponded to "bumps" on the skull which could be read by the expert, thus giving a complete account of the character of the subject. In fact, (*a*) no such faculties are located in the brain anywhere for this is simply not the way the brain works; (*b*) the faculties described by Gall are not pure traits which cannot be further analysed and are based on a long outdated psychology; (*c*) the shape of the brain bears no specific relationship to the shape of the skull. Phrenology is a pseudo-science; there is no truth in it whatever. But, even so, like astrology, it still has its practitioners.

Physiocrats. A French school of economic thought during the 18th cent., known at the time as *Les Economistes* but in later years named physiocrats by Du Pont de Nemours, a member of the School. Other members were Quesnay, Mirabeau, and the great financier Turgot. The physiocrats held the view, common to the 18th cent., and deriving ultimately from Rousseau, of the goodness and bounty of nature and the goodness of man "as he came from the bosom of nature." The aim of governments, therefore, should be to conform to nature; and so long as men do not interfere with each other's liberty and do not combine among themselves, governments should leave them free to find their own salvation. Criminals, madmen, and monopolists should be eliminated. Otherwise the duty of government is *laissez-faire, laissez passer*. From this follows the doctrine of free trade between nations on grounds of both justice and economy; for the greater the competition, the more will each one strive to economise the cost of his labour to the general advantage. Adam Smith, although not sharing their confidence in human nature, learned much from the physiocrats, eliminated their errors, and greatly developed their teaching.

Physiognomy. *See* **Characterology.**

Pietism, a movement in the Lutheran Church at the end of the 17th cent.—the reaction, after the sufferings of the thirty years' war, of a pious and humiliated people against learning, pomp and ceremony, and stressing the importance of man's personal relationship with God. The writings of Johann Georg Hamann (1730–88) who came from a Pietist family of Königsberg influenced Kierkegaard. The Pietist movement was the root of the great Romantic movement of the 18th cent.

Plymouth Brethren, a religious sect founded by John Nelson Darby, a minister of the Protestant Church of Ireland, and Edward Cronin, a former Roman Catholic, in 1827. Both were dissatisfied with the lack of spirituality in their own and other churches and joined together in

small meetings in Dublin every Sunday for "the breaking of bread." Soon the movement began to spread through Darby's travels and writings and he finally settled in Plymouth, giving the popular name to the "Brethren." Beginning as a movement open to all who felt the need to "keep the unity of the Spirit," it soon exercised the right to exclude all who had unorthodox views and split up into smaller groups. Among these the main ones were the "Exclusives," the Kellyites, the Newtonites, and "Bethesda" whose main differences were over problems of church government or prophetical powers. Some of these are further split among themselves. Readers of *Father and Son* by Sir Edmund Gosse, which describes life with his father, the eminent naturalist Philip Gosse, who belonged to the Brethren, will recall how this basically kind, honest, and learned man was led through their teachings to acts of unkindness (*e.g.*, in refusing to allow his son and other members of his household to celebrate Christmas and throwing out the small tokens they had secretly bought), and intellectual dishonesty (*e.g.*, in refusing for religious reasons alone to accept Darwinism when all his evidence pointed towards it).

The original views of Darby which were perpetuated by the "Exclusive" Brethren were somewhat as follows: Christianity has fallen from New Testament purity and all Christendom and every Church is corrupt and has incurred God's displeasure, notably by establishing ministerial offices which hinder the believer's approach to God. Ministers should not be officials but possess special gifts ("Charismata") granted from above and assigned by the Holy Ghost according to his will; these Charismata have no connection whatever with any official posts although in some cases they may coincide with them. The whole doctrine of the Brethren is based on the need for *direct* access to God and the rejection of any intermediate agency such as priests, ministers or presbyters. The Exclusive Brethren adopted new harsh rules in 1965 designed to prevent "Saints" (members) from having any contact with "Sinners" (non-members). Members sharing homes with non-members were to be expelled; members must declare their bank balances; unmarried members, single or widowed, must marry as soon as possible within the sect.

Today, the majority of Brethren belong to the "Open Brethren" assemblies and, unlike the "Exclusives," hold that the Lord's Supper (a commemorative act of "breaking the bread" observed once a week) is for all Christians who care to join them. Baptism is required and Brethren believe in the personal premillenial second coming of Christ.

Poltergeist, allegedly a noisy type of spirit which specialises in throwing things about, making loud thumpings and bangings, and occasionally bringing in "apports," *i.e.*, objects from elsewhere. Most so-called poltergeist activities are plain frauds, but the others are almost invariably associated with the presence in the house of someone (often, but not always a child) who is suffering from severe mental conflicts usually of a sexual nature. The inference is that those activities which are not simply fraudulent are either due to some unknown influence exuded by such mentally abnormal people, or that they are actually carried out by ordinary physical means by such people when in a state of hysterical dissociation—*i.e.*, unconsciously. The second hypothesis is much the more probable. *See* **Psychic Research.**

Polytheism. *See* **God and Man.**

Positivism, also known as the Religion of Humanity, was founded by Auguste Comte (1798–1857), a famous mathematician and philosopher born in Montpellier, France. His views up to the end of the century attracted many and it would have been impossible throughout that time to read a book on philosophy or sociology that did not mention them, but today his significance is purely of historical interest. In his *Cours de Philosophie Positive* (1830) he put forward the thesis that mankind had seen three great stages in human thought: (1) the theological, during which man seeks for supernatural causes to explain nature and invents gods and devils; (2) the metaphysical, through which he thinks in terms of philosophical and metaphysical abstractions; (3) the last positive or scientific stage when he will proceed by experiment and objective observation to reach in time "positive truth."

Broadly speaking, there is little to complain of in this analysis; for there does seem to have been some sort of general direction along these lines. However, Comte was not satisfied with having reached this point and felt that his system demanded a religion and, of course, one that was "scientific." This religion was to be the worship of Humanity in place of the personal Deity of earlier times, and for it he supplied not only a Positive Catechism but a treatise on Sociology in which he declared himself the High Priest of the cult. Since, as it stood, the religion was likely to appear somewhat abstract to many, Comte drew up a list of historical characters whom he regarded as worthy of the same sort of adoration as Catholics accord to their saints. The new Church attracted few members, even among those who had a high regard for Comte's scientific work, and its only significant adherents were a small group of Oxford scholars and some in his own country. Frederic Harrison was the best-known English adherent and throughout his life continued to preach Comtist doctrines in London to diminishing audiences.

Pragmatism, a typically American school of philosophy which comes under the heading of what Bertrand Russell describes as a "practical" as opposed to a "theoretical" philosophy. Whereas the latter, to which most of the great philosophical systems belong, seeks disinterested knowledge for its own sake, the former (*a*) regards action as the supreme good, (*b*) considers happiness an effect and knowledge a mere instrument of successful activity.

The originator of Pragmatism is usually considered to have been the psychologist William James (1842–1910) although he himself attributed its basic principles to C. S. Peirce. The other famous Pragmatist is Dr. John Dewey, best-known in Europe for his works on education (for although American text-books on philosophy express opinions to the contrary, few educated people in Europe have taken the slightest interest in Pragmatism and generally regard it as an eccentricity peculiar to Americans).

The basic source of Pragmatism is William James's book *The Will to Believe* (1896) in which he points out that we are often compelled to take a decision where no adequate theoretical grounds for a decision exist; for even to do nothing is to decide. Thus in religion we have a right to adopt a believing attitude although not intellectually fully convinced. We should believe truth and shun error, but the failing of the sceptical philosopher is that he adheres only to the latter rule and thus fails to believe various truths which a less cautious man will accept. If believing truth and avoiding error are equally important, then it is a good idea when we are presented with an alternative to believe one of the possibilities at will, since we then have an even chance of being right, whereas we have none if we suspend judgment. The function of philosophy, according to James, is to find out what difference it makes to the individual if a particular philosophy or world-system is true: "An idea is 'true' so long as to believe it is profitable to our lives," and, he adds, "the true is only the expedient in our way of thinking . . . in the long run and on the whole of course." Thus "if the hypothesis of God works satisfactorily in the widest sense of the word, it is true." Bertrand Russell's reply to this assertion is: "I have always found that the hypothesis of Santa Claus 'works satisfactorily in the widest sense of the word'; therefore 'Santa Claus exists' is true, although Santa Claus does not exist." Russell adds that James's concept of truth simply omits as unimportant the question whether God really *is* in His heaven; if He is a useful hypothesis that is enough. "God the Architect of the Cosmos is forgotten; all that is remembered is belief in God, and its effects upon the creatures inhabiting our petty planet. No wonder the Pope condemned the pragmatic defence of religion."

Predestination. *See* **Calvanism.**

Presbyterianism, a system of ecclesiastical government of the Protestant churches which look back to John Calvin as their Reformation leader. The ministry consists of presbyters who are all of equal rank. Its doctrinal standards are contained in the *Westminster Confession of Faith* (1647) which is, in general, accepted by English, Scottish, and American Presbyterians as the most thorough and logical statement in existence of the Calvinist creed. The Church of Scotland is the leading Presbyterian church in the British Isles.

The Reformation in Scotland was preceded by the same sort of awareness of the moral corruption of the Roman Church as had happened elsewhere, but for various political and emotional reasons, which need not be discussed here, the majority of the Scottish people (unlike the English who had been satisfied with the mere exchange of Crown for Pope) were determined on a fundamental change of doctrine, discipline, and worship, rather than a reform of manners. The church preachers had learned their Protestantism not from Luther but from Calvin and their leader John Knox had worked in Geneva with Calvin himself and was resolved to introduce the system into Scotland. In 1557 the "Lords of the Congregation" signed the Common Band (*i.e.*, a bond or covenant) to maintain "the blessed Word of God and his congregation" against their enemies, and demanded the right to worship as they had chosen. However, the real date of the Scottish Reformation is August 1560 when Mary of Guise (the regent for Mary Queen of Scots who was not yet of age) died and the Estates met to settle their affairs without foreign pressure; the *Scots Confession* was drawn up and signed by Knox and adopted by the Estates.

The ideas on which the Reformed Kirk was based are found in the *Scots Confession*, the *Book of Discipline*, and the *Book of Common Order*, the so-called Knox's liturgy. Knox's liturgy, the same as that used in Geneva but translated into English, was used until Laud's attempt to force an Anglican liturgy on the Kirk led to an abandonment of both in favour of "free prayers."

The Presbyterian tradition includes uncompromising stress upon the Word of God contained in the Scriptures of the Old and New Testaments as the supreme rule of faith and life, and upon the value of a highly trained ministry, which has given the Church of Scotland a high reputation for scholarship and has in turn influenced the standard of education in Scotland. The unity of the Church is guaranteed by providing for democratic representation in a hierarchy of courts (unlike the Anglican Church, which is a hierarchy of persons). The local kirk-session consists of the minister and popularly elected elders (laymen). Ministers, elected by their flocks, are ordained by presbyters (ministers already ordained). Above the kirk-session is the court of the presbytery which has jurisdiction over a specified area; above that the court of synod which rules over many presbyteries; and finally the General Assembly which is the Supreme Court of the Church with both judicial and legislative powers, and over which the Moderator of the General Assembly presides. The function of the elders is to help the minister in the work and government of the kirk. The episcopacy set up by James VI and I, and maintained by Charles I was brought to an end by the Glasgow Assembly (1638), but General Assemblies were abolished by Oliver Cromwell and at the Restoration Charles II re-established episcopacy. The Covenanters who resisted were hunted down, imprisoned, transported, or executed over a period of nearly thirty years before William of Orange came to the throne and Presbyterianism was re-established (1690). Today Presbyterians no less than other Christian communities are looking at Christianity as a common world religion in the sense that the principles which unite them are greater than those which divide them. *See* **Church of Scotland, Calvinism.**

Protestant, the name first applied to those who favoured the cause of Martin Luther and who protested against the intolerant decisions of the Catholic majority at the second Diet of Speyer (1529), revoking earlier decisions of the first Diet of Speyer tolerating the Reformers in certain cases (1526). In general the name "Protestant" is applied to those Churches which severed connection with Rome at the time of the Reformation. The essence of Protestantism is the acceptance by the individual Christian of his direct responsibility to God rather than to the Church. *See* **Lutheranism, Presbyterianism, Calvinism.**

Psychic Research, the *scientific* study of so-called psychic phenomena as contrasted with spiritualism (*q.v.*) which is the cult of those who already believe in their supernatural nature. It is obviously impossible here to summarise work that has been carried out (in Britain notably by the Society for Psychical Research, founded in 1882) on such subjects as mediumship, apparitions, telepathy and clairvoyance (discussed here separately under the heading of Telepathy), poltergeists (also discussed separately), levitation, and precognition.

But the point at which we must begin is the human mind and the nature of scientific evidence and so far as these are concerned the following points may be made.

(1) There is little use in discussing psychic phenomena until we realise that almost no human being—least of all one with strong convictions—is a completely trustworthy witness. A person may be utterly honest in every other respect except that in which his convictions are involved.

(2) This does not mean that a witness is either telling the whole truth or is simply lying; for the following possibilities exist: (*a*) he may be telling the truth; (*b*) he may be consciously lying for motives of his own; (*c*) his recollections may be incorrect in discussing something that happened in the past; (*d*) he may really believe that he saw or heard what he said he did and may be telling the truth *as he experienced it*—*e.g.*, seeing a ghost—without realising that what he experienced is a product of his own unconscious mind; (*e*) there are various degrees of lying, for the mind has a natural tendency to add coherence and meaning to the only partly coherent events of the day, and it is a normal trait (consciously or unconsciously) to make a "good story" out of what originally were isolated and unconnected happenings; (*f*) even under the most favourable conditions the evidence of scientifically-trained people is not as good as it might be (cf. the psychological experiment in which a class of students is suddenly exposed to a deliberately contrived scene, *e.g.*, two men eccentrically dressed rush into the lecture-room, exchange words, and have a quarrel—and the students are afterwards required to write down what they saw and heard, rarely 10 per cent. being even 70 per cent. correct as to what really happened).

(3) There are many aspects of "psychic" phenomena which are not "psychic" at all, but based on well-known scientific principles. How many people, for example, know: (*a*) that *every* physical illness has its psychological aspect, so that a person with chronic arthritis, let us say, may get up and walk for the first time in years after injection with a new drug which is later proved to be worthless or no better than aspirin (*e.g.*, cortisone), yet if a "spiritual healer" got the same results he would be acclaimed for his psychic powers; (*b*) that it is possible to be completely paralysed, totally blind or deaf, have total loss of sensation in some part of the body, have two or more personalities, *without any physical disease being present*, in the neurosis (cured daily by psychiatrists without mystery) known as hysteria.

(4) It is possible under hypnosis, or self-hypnosis, to produce stigmata—*e.g.*, marks resembling the nail-prints of the Crucifixion on hands and feet, to produce blisters at will, spontaneous bleeding, and many of the phenomena usually described as miraculous, in the consulting room and by scientific means.

(5) We all have more potent senses than we ordinarily realise. We may not consciously know the number of steps leading to our flat, but can be made under hypnosis to tell.

Furthermore, there are people who are hypersensitive in hearing and vision (often without being aware of it), so that in "thought-transference" experiments where they are sent to another room whilst others decide on some object or idea, they may subconsciously hear what is going on; or in card experiments in telepathy they may be able to read the face of the card reflected in the pupils of the "sender" opposite, or tell in a familiar pack which card is which from almost invisible differences on the backs of the cards.

(6) Most of us have no idea of the mathematical laws of probability and are therefore likely to misinterpret the "mysteriousness" of phenomena. Thus, suppose I have a "premonition" that someone has died and later find my feelings confirmed by the event, then I may not remember or know (*a*) that on many previous occasions I, in common with most other people, have had "premonitions" the vast majority of which did *not* come true; (*b*) that, on the last occasion I saw the person, or from things I may have heard, I may have unconsciously noted signs that all was not well and expected the event; (*c*) that the most "improbable" things happen quite normally (*e.g.*, during the last war a flying bomb fell through the roof of the British Museum and failed to explode, and some time later a second flying bomb fell *through the same hole* and likewise *failed to explode*); (*d*) that the chance of a pack of cards being dealt so that each of four persons receives a complete suit is exactly the same as the chance that any other combination of cards may come up.

(7) That collective hallucinosis does occur (it would be invidious to mention in detail certain "miraculous happenings" which might hurt the religious susceptibilities of many, but we are entitled to ask how it is possible for the sun to stand still in the sky in the presence of thousands of people collected in a particular area when it is seen nowhere else in the world and has been noted by no astronomical laboratory?)

(8) Mediums have been proved to be prepared to do the most extraordinary things in order to deceive a suggestible audience seated in semi-darkness—*e.g.*, the so-called "ectoplasm" (a supposedly psychic substance or materialisation) which exudes from the medium's body has been found before the séance, as have "apports" or objects apparently appearing from nowhere, half-way down the medium's throat or in the stomach ready to be regurgitated, and even in other bodily apertures.

It is not maintained that psychic phenomena do not happen, but that we must be extremely cautious in accepting the evidence of our own, or even more, other people's, senses, and much less free in our interpretation of what has been observed really means. *See* Poltergeist, Telepathy, Spiritualism.

Psychoanalysis. *See* Section F, Part III.

Pyrrhonism, a sceptical philosophy which doubts everything.

Q

Quakers. *See* Friends, The Society of.

Quartodecimani, an early Christian community who celebrated the Easter festival on the 14th day of the month, when the Jews celebrated their Passover. In consequence of the confusion caused, the practice was condemned by the Council of Nicaea in 325.

Quietism, a doctrine of extreme asceticism and contemplative devotion, embodied in the works of Michael Molinos, a 17th cent. Spanish priest, and condemned by Rome. It taught that the chief duty of man is to be occupied in the continual contemplation of God, so as to become totally independent of outward circumstances and the influence of the senses. Quietists taught that when this stage of perfection is reached the soul has no further need for prayer and other external devotional practices. Similar doctrines have been taught in the Moslem and Hindu religions. *See* Yoga.

R

Racism, the doctrine that one race is inherently superior or inferior to others, one of the bases of racial prejudice. It has no connection whatever with the study of race as a concept, or the investigation of racial differences, which is a science practised by the physical anthropologist (who studies physical differences), or the social anthropologist (who studies cultural differences). Racism is simply a vulgar superstition believed in by the ignorant or mentally unbalanced, and it may be categorically stated as a scientific fact that racial superiority is a myth believed in by no scientist of repute. There are, therefore, only two questions which it is necessary to answer: (1) If no race is superior to any other, why are there obvious differences between the backward and the technically advanced peoples? (2) If there are no inherent differences between races, then why does racial prejudice exist? Both of these are, strictly speaking, questions to which the scientists must give an answer; the former is answered in Section F, Part III, and Section Q, Part II; the latter under Anti-semitism, J3.

Ranters, a derisive term for the Primitive Methodists (*see* Methodism).

Rationalism is defined as "the treating of reason as the ultimate authority in religion and the rejection of doctrines not consonant with reason." In practice, rationalism has a double significance: (1) the doctrine as defined above, and (2) a 19th cent. movement which was given to what was then known as "free-thought," "secularism," or agnosticism—*i.e.*, it was in the positive sense anti-religious and was represented by various bodies such as the Secular Society, the National Secular Society, and the Rationalist Press Association (founded in 1899).

In the first sense, which implies a particular philosophical attitude to the universe and life, rationalism is not easy to pin down although, at first sight, it would appear that nothing could be simpler. Does it mean the use of pure reason and logic or does it mean, on the other hand, the use of what is generally called the "scientific method" based on observation (*i.e.*, the evidence of our senses) and experiment? If we are thinking in terms of the use of pure reason and logic then the Roman Catholic Church throughout most of its history has maintained, not that the whole truth about religion can be discovered by reason, but as St. Thomas Aquinas held, the basis of religion—*e.g.*, the existence of God—can be rationally demonstrated. Nobody could have made more use of logic than the schoolmen of the Middle Ages, yet not many people today would accept their conclusions, nor would many non-Catholics accept St. Thomas's proofs of the existence of God even when they themselves are religious. The arguments of a first Cause or Prime Mover or the argument from Design on the whole leave us unmoved, partly because they do not lead us to the idea of a *personal God*, partly because we rightly distrust logic and pure reason divorced from facts and know that, if we begin from the wrong assumptions or premises, we can arrive at some very strange answers. If the existence of a Deity can be proved by reason, then one can also by the use of reason come to the conclusions, or rather paradoxes, such as the following: God is by definition all good, all knowing, all powerful—yet evil exists (because if it does not exist then it cannot be wrong to say "there is no God"). But if evil exists, then it must do so either because of God (in which case He is not all good) or in spite of God (in which case He is not all powerful).

Arguments of this sort do not appeal to the modern mind for two historical reasons: (1) many of us have been brought up in the Protestant tradition which—at least in one of its aspects—insists that we must believe in God by faith rather than by logic and in its extreme form insists on God as revealed by the "inner light"; (2) our increasing trust in the scientific method by direct observation and experiment. Thus, no matter what Aristotle or St. Thomas may say about a Prime Mover or a First Cause, we remain unconvinced since at least one scientific theory suggests that the universe did not have a beginning and if scientific investigation proved this to be so, then we should be entirely indifferent to what formal logic had to say.

The secularist and rationalist movements of

the 19th cent. were anti-religious—and quite rightly so—because at that time there were serious disabilities imposed even in Britain by the Established Church on atheism or agnosticism and freedom of thought. They are of little significance now because very little is left, largely thanks to their efforts, of these disabilities.

Finally, although most people are likely to accept the scientific method as the main means of discovering truth, there are other factors which equally make us doubt the value of "pure" logic and reason unaided by observation. The first of these is the influence of Freud which shows that much of our reasoning is mere rationalising—*e.g.*, we are more likely to become atheists because we hated our father than because we can prove that there is no God The second is the influence of a movement in philosophy which, in the form of logical positivism or logical analysis, makes us doubt whether metaphysical systems have any meaning at all. Today, instead of asking ourselves whether Plato was right or wrong, we are much more likely to ask whether he did anything but make for the most part meaningless noises. Religion is in a sense much safer today than it ever was in the 19th cent. when it made foolish statements over matters of science that could be *proved* wrong; now we tend to see it as an emotional attitude to the universe or God (a "feeling of being at home in the universe," as William James put it) which can no more be proved or disproved than being in love.

Realism is a word which has so many meanings, and such contradictory ones, in various spheres, that it is difficult to define. We shall limit ourselves to its significance in philosophy. In philosophy, "realism" has two different meanings, diametrically opposed. (1) The most usual meaning is the one we should least expect from the everyday sense of the word—*i.e.*, it refers to all those philosophies from Plato onwards which maintained that the world of appearance is illusory and that ideas, forms, or universals are the only true realities belonging to the world beyond matter and appearance—the world of God or mind. In early mediaeval times St. Thomas Aquinas was the chief exponent of this doctrine which was held by the scholastics as opposed to the Nominalists (*q.v.*). (2) In its modern everyday meaning "realism" is the belief that the universe is real and not a creation of mind, that although all we really experience is the evidence of our senses there is a reality that causes the appearance, the "thing-in-itself" as Kant described it. Material things may not really be what they appear to be (*e.g.*, a noise is not the "bang" we experience but a series of shock-waves passing through the atmosphere), yet, for all that, we can be sure that matter exists and it is very possible (some might add) that mind does not.

Reformation, the great religious movement of the 16th cent., which resulted in the establishment of Protestantism. John Wyclif (d. 1384), John Hus (d. 1415) and others had sounded the warning note, and when later on Luther took up the cause in Germany, and Zwingli in Switzerland, adherents soon became numerous. The wholesale vending of indulgences by the papal agents had incensed the people, and when Luther denounced these things he spoke to willing ears. After much controversy, the reformers boldly propounded the principles of the new doctrine, and the struggle for religious supremacy grew bitter. They claimed justification (salvation) by faith, and the use as well as the authority of the Scriptures, rejecting the doctrine of transubstantiation, the adoration of the Virgin and Saints, and the headship of the Pope. Luther was excommunicated. But the Reformation principles spread and ultimately a great part of Germany, as well as Switzerland, the Low Countries, Scandinavia, England, and Scotland were won over to the new faith. In England Henry VIII readily espoused the cause of the Reformation, his own personal quarrel with the Pope acting as an incentive. Under Mary there was a brief and sanguinary reaction, but Elizabeth gave completeness to the work which her father had initiated. *See* **Lutheranism, Calvinism, Presbyterianism, Baptists, Methodism.**

Reincarnation, the transmigration of souls. *See* **Immortality, Hinduism, Buddhism.**

Renaissance is defined in the *Oxford English Dictionary* as: "The revival of art and letters, under the influence of classical models, which began in Italy in the 14th century." It is a term which must be used with care for the following reasons: (1) Although it was first used in the form *rinascita* (re-birth) by Vasari in 1550 and people living at that time certainly were aware that something new was happening, the word had no wide currency until used by the Swiss historian Jacob Burchardt in his classic *The Civilization of the Renaissance in Italy* (1860). (2) The term as used today refers not only to art in its widest sense but to a total change in man's outlook on life which extended into philosophical, scientific, economic, and technical fields. (3) Spreading from Italy there were renaissance movements in France, Spain, Germany, and northern Europe, all widely different with varying delays in time. As the historian Edith Sichel says: "Out of the Italian Renaissance there issued a new-born art; out of the Northern Renaissance there came forth a new-born religion. There came forth also a great school of poetry, and a drama the greatest that the world had seen since the days of Greece. The religion was the offspring of Germany and the poetry that of England."

The real cause of the Renaissance was not the fall of Constantinople, the invention of printing, the discovery of America, though these were phases in the process; it was, quite simply money. The rise of a new merchant class gave rise to individualist attitudes in economic affairs which prepared the way for individualism and humanism. The new wealthy class in time became patrons of the arts whereas previously the Church had been the sole patron and controller. Thus the artist became more free to express himself, more respected, and being more well-to-do could afford to ignore the Church and even, in time, the views of his patrons.

It is true that art continued to serve to a considerable extent the purposes of faith, but it was judged from the standpoint of art. Mediaeval art was meant to elevate and teach man: Renaissance art to delight his senses and enrich his life. From this free and questing spirit acquired from economic individualism came the rise of modern science and technology; here Italy learned much from the Arab scholars who had translated and commented upon the philosophical, medical, and mathematical texts of antiquity, while denying themselves any interest in Greek art and literature. Arabic-Latin versions of Aristotle were in use well into the 16th cent. The Byzantine culture, though it had preserved the Greek tradition and gave supremacy to Plato, had made no move forward. But the Greek scholars who fled to Italy after the fall of Constantinople brought with them an immense cargo of classical manuscripts. The recovery of these Greek masterpieces, their translation into the vernaculars, and the invention of printing, made possible a completer understanding of the Greek spirit. It was the bringing together of the two heritages, Greek science, and Greek literature, that gave birth to a new vision. But it was not only Aristotle and Plato who were being studied but Ovid, Catullus, Horace, Pliny and Lucretius. What interested Renaissance man was the humanism of the Latin writers, their attitude to science, their scepticism.

The period *c.* 1400–1500 is known as the **Early Renaissance.** During this time such painters as Masaccio, Uccello, Piero della Francesca, Botticelli, and Giovanni Bellini were laying the foundations of drawing and painting for all subsequent periods including our own. They concerned themselves with such problems as anatomy, composition, perspective, and representation of space, creating in effect a grammar or textbook of visual expression. The term **High Renaissance** is reserved for a very brief period when a pure, balanced, classical harmony was achieved and artists were in complete control of the techniques learned earlier. The High Renaissance lasted only from *c.* 1500 to 1527 (the date of the sack of Rome), yet that

interval included the earlier works of Michelangelo, most of Leonardo's, and all the Roman works of Raphael.

Ritualism, a tendency which, during the 19th cent., developed in the High Church section of the Church of England to make use of those vestments, candles, incense, etc. which are usually regarded as features of the Church of Rome. Since some opposition was aroused, a Ritual Commission was appointed in 1904 to take evidence and try to find some common basis on which High and Low Church could agree with respect to ceremonial. The report of 1906 in effect recommended the giving of greater powers to bishops to suppress objectionable practices. Although they are often associated together, it is worth while pointing out that there was no special connection between the Oxford Movement or **Tractarians** (*q.v.*) and Ritualism because Pusey disliked ritual and even Newman, who eventually went over to Rome, held extremely simple services at his church of St. Mary's.

Roman Catholic Church, the Christian organisation which acknowledges the Pope as the lawful successor of St. Peter, the apostle appointed by Christ to be the head of His Church. The reforming impulse at the Second Vatican Council (1962–5) has set in train great movements towards religious unity and the reform and modernisation of the Roman Catholic Church.

Romantic Movement or Romanticism is the name given not so much to an individual way of thinking but to the gradual but radical transformation of basic human values that occurred in the Western world round about the latter part of the 18th cent. It was a great breakthrough in European consciousness and arose through the writings of certain men living during the half-century or more following, say, 1760. It arose then because both time and place were propitious for the birth of these new ideas. There was a revolution in basic values—in art, morals, politics, religion, etc. The new view was of a world transcending the old one, infinitely larger and more varied.

To understand the Romantic movement it is necessary first to take note of the climate of thought preceding the great change; then to account for its beginning in Germany where it did (*see* **Pietism**) during the latter part of the 18th cent., and finally to appraise the writings of those men whose ideas fermented the new awakening. Briefly, the shift was away from French classicism and from belief in the all-pervasive power of human reason (the Enlightenment) towards the unfettered freedom that the new consciousness was able to engender. What mattered was to live a passionate and vigorous life, to dedicate oneself to an ideal, no matter what the cost (*e.g.*, Byron).

The ideas of the Enlightenment (*e.g.*, Fontenelle, Voltaire, Montesquieu) had been attacked by the Germans Hamann and Herder and by the ideas of the English philosopher Hume, but Kant, Schiller, and Fichte, Goethe's novel *Wilhelm Meister*, and the French Revolution all had profound effects on the aesthetic, moral, social, and political thought of the time. Friedrich Schlegel (1772–1829) said: "There is in man a terrible unsatisfied desire to soar into infinity; a feverish longing to break through the narrow bonds of individuality." Romanticism undermined the notion that in matters of value there are objective criteria which operate between men. Henceforth there was to be a resurgence of the human spirit, deep and profound, that is still going on.

Rotarianism. The Rotary Club is primarily an American association but has many members in Britain and presumably elsewhere since all Rotary Clubs are united in an international organisation. It consists of groups of business and professional men formed with the purpose of serving their community and humanity in general. The name is derived from the clubs entertaining in rotation.

S

Sabellian heresy. During the 4th cent. great controversies raged within the Christian Church over the divinity of Jesus Christ. Arius (*see* **Arianism**) denied Christ's divinity and maintained that the Father alone was truly divine. This doctrine was condemned at the Council of Nicaea (325), Arius being opposed by Athanasius who held the now orthodox view of the Trinity which was reaffirmed at the Council of Constantinople (381). The Sabellians, named after their founder Sabellius (*fl.* 215), a Libyan priest and theologian, held the view that God is indivisible but with three roles, appearing successively as the Father (the creator), as the Son (the redeemer), and as the Holy Spirit (the divine spirit within men). This view which makes the person of Jesus Christ ultimately an illusion, was condemned.

Salvation Army. The religious movement which in 1878 became known by this name arose from the Christian Mission meetings which the Rev. William Booth and his devoted wife had held in the East End of London for the previous thirteen years. Its primary aim was, and still is, to preach the gospel of Jesus Christ to men and women untouched by ordinary religious efforts. The founder devoted his life to the salvation of the submerged classes whose conditions at that time were unspeakably dreadful. Originally his aim had been to convert people and then send them on to the churches, but he soon found that few religious bodies would accept these "low-class" men and women. So it was that social work became part of their effort. Practical help, like the provision of soup-kitchens, accompanied spiritual ministration. Soon, in the interests of more effective "warfare" against social evils, a military form of organisation, with uniforms, brass bands, and religious songs, was introduced. Its magazine *The War Cry* gave as its aim "to carry the Blood of Christ and the Fire of the Holy Ghost into every part of the world." There were persecutions: mobs, sometimes encouraged by the police, assaulted the Salvationists who, although not the aggressors, were often punished by the magistrates. General Booth saw with blinding clarity that conversion must be accompanied by an improvement of external conditions. Various books had earlier described the terrible conditions of the slums, but in 1890 he produced a monumental survey entitled *In Darkest England and the Way Out*. From that time forward the Army was accepted and its facilities made use of by the authorities. Today the Army's spiritual and social activities have spread to countries all over the world; every one no matter what class, colour, or creed he belongs to is a "brother for whom Christ died."

Sandemanians or Glassites, an obscure religious sect whose sole claim to fame is that one of its members was the great Michael Faraday, founder of the science of electromagnetism, who never failed to attend its Sunday services.

Sceptics. From Thales of Miletus (*c.* 624–565 B.C.) to the Stoics in the 4th cent. B.C. philosophers had been trying to explain the nature of the universe; each one produced a different theory and each could, apparently, prove that he was right. This diversity of views convinced the Sceptic school founded by Pyrrho (*c.* 360–270 B.C.) that man is unable to know the real nature of the world or how it came into being. In place of a futile search for what must be for ever unknowable, the Sceptics recommended that men should be practical, follow custom, and accept the evidence of their senses.

Schoolmen. From the time of Augustine to the middle of the 9th cent. philosophy, like science, was dead or merely a repetition of what had gone before. But about that time there arose a new interest in the subject, although (since by then Western Europe was entirely under the authority of the Catholic Church) the main form it took was an attempt to justify Church teaching in the light of Greek philosophy. Those who made this attempt to reconcile Christian beliefs with the best in Plato and Aristotle were known as "schoolmen" and the philosophies which they developed were known as "scholasticism." Among the most famous schoolmen must be counted John Scotus Erigena (*c.* 800–*c.* 877), born in Ireland and probably the earliest; St. Anselm, archbishop of Canterbury (1033–1109); the great Peter Abelard whose school was in Paris (1079–1142); Bernard of Chartres, his contemporary; and

the best-known of all, St. Thomas Aquinas of Naples (1225–74), who was given the name of the "Angelic Doctor."

The philosophies of these men are discussed under various headings (God and Man, Determinism and Free-will), but being severely limited by the Church their doctrines differed from each other much less than those of later philosophical schools. However, one of the great arguments was between the orthodox Realists (*q.v.*) and the Nominalists (*q.v.*) and a second was between the Thomists (or followers of St. Thomas Aquinas) and the Scotists (followers of John Duns Scotus—not to be confused with John Scotus Erigena). The two latter schools were known as the Ancients, whilst the followers of William of Occam, the Nominalist, were known as the Terminalists. All became reconciled in 1482 in face of the threat from humanism of which the great exponent was Erasmus of Rotterdam (1466–1536) who hated scholasticism.

Shakers, members of a revivalist group, styled by themselves "The United Society of Believers in Christ's Second Appearing," who seceded from Quakerism in 1747 though adhering to many of the Quaker tenets. The community was joined in 1758 by Ann Lee, a young convert from Manchester, who had "revelations" that she was the female Christ; "Mother Ann" was accepted as their leader. Under the influence of her prophetic visions she set out with nine followers for "Immanuel's land" in America and the community settled near Albany, capital of New York state. They were known as the "Shakers" in ridicule because they were given to involuntary movements in moments of religious ecstasy.

Central to their faith was the belief in the dual role of God through the male and female Christ: the male principle came to earth in Jesus; the female principle, in "Mother Ann." The sexes were equal and women preached as often as men at their meetings which sometimes included sacred dances—nevertheless the two sexes, even in dancing, kept apart. Their communistic way of living brought them economic prosperity, the Shakers becoming known as good agriculturists and craftsmen, noted for their furniture and textiles. After 1860, however, the movement began to decline and few, if any, are active today.

Shamans, the medicine men found in all primitive societies who used their magical arts to work cures, and protect the group from evil influences. The *shaman* was a man apart and wore special garments to show his authority. Shamanism with its magical practices, incantations, trances, exhausting dances, and self-torture is practised even today by tribes that have survived in a primitive state of culture.

Shiites or Shia, a heretical Moslem sect in Persia, opposed by the orthodox Sunnites. The dispute, which came almost immediately after the death of the Prophet and led to bitter feuding, had little to do with matters of doctrine as such, but with the succession. After Mohammed's death, there were three possible claimants; Ali, the husband of his daughter Fatima, and two others, one of whom gave up his claim in favour of the other, Omar. The orthodox selected Omar, who was shortly assassinated, and the same happened to his successor as Ali was passed over again. The Shiites are those who maintain that Ali was the true vicar of the Prophet, and that the three orthodox predecessors were usurpers.

Shintoism, the native religion of Japan, primarily a system of nature and ancestor worship. After the defeat of Japan in the second world war Hirohito disavowed his divinity as ancestor of the Sun-goddess.

Sikhism. The Sikh community of the Punjab, which has played a significant part in the history of modern India, came into being during a period of religious revival in India in the 15th and 16th cent. It was originally founded as a religious sect by Guru (teacher) Nanak (1469–1538) who emphasised the fundamental truth of all religions, and whose mission was to put an end to religious conflict. He condemned the formalism both of Hinduism and Islam, preaching the gospel of universal toleration, and the unity of the Godhead, whether He be called Allah, Vishnu, or God. His ideas were welcomed by the great Mogul Emperor Akbar (1542–1605). Thus a succession of Gurus were able to live in peace after Nanak's death; they established the great Sikh centre at Amritsar, compiled the sacred writings known as the *Adi Granth*, and improved their organisation as a sect. But the peace did not last long, for an emperor arose who was a fanatical Moslem, in face of whom the last Guru, Govind Singh (1666–1708), whose father was put to death for refusal to embrace Islam, had to make himself a warrior and instil into the Sikhs a more aggressive spirit. A number of ceremonies were instituted by Govind Singh; admission to the fraternity was by special rite; caste distinctions were abolished; hair was worn long; the word singh, meaning lion, was added to the original name. They were able to organise themselves into 12 *misls* or confederacies but divisions appeared with the disappearance of a common enemy and it was not until the rise of Ranjit Singh (1780–1839) that a single powerful Sikh kingdom was established, its influence only being checked by the English, with whom a treaty of friendship was made. After the death of Ranjit Singh two Anglo-Sikh wars followed, in 1845–46, and 1848–49, which resulted in British annexation of the Punjab and the end of Sikh independence. In the two world wars the Sikhs proved among the most loyal of Britain's Indian subjects. The partitioning of the continent of India in 1947 into two states, one predominantly Hindu and the other predominantly Moslem, presented a considerable problem in the Punjab, which was divided in such a way as to leave 2 million Sikhs in Pakistan, and a considerable number of Moslems in the Indian Punjab. Although numbering less than 2 per cent. of the population (*c.* 8 million) the Sikhs are a continuing factor in Indian political life. In 1966 the Punjab was divided on a linguistic basis—Punjabi-speaking Punjab and Hindi-speaking Hariana.

Socialism, a form of society in which men and women are not divided into opposing economic classes but live together under conditions of approximate social and economic equality, using in common the means that lie to their hands of promoting social welfare. The brotherhood of man inspires the aims of socialism in foreign, colonial, social, and economic policies alike. The word "socialism" first came into general use in England about 1834 in connection with Robert Owen's "village of co-operation" at New Lanark. About the middle of the 19th cent. Charles Kingsley and others established a form of Christian socialism, and William Morris, John Burns, and others founded a Socialist League in 1886. With the development of trade unions the socialist movement took a more practical trend. Fabianism (*q.v.*) associated in its early days with the names of Beatrice and Sidney Webb and George Bernard Shaw, aims at the gradual reorganisation of society by creating intelligent public opinion by education and legislation. The British Labour Party believes in peaceful and constitutional change to socialism by democratic methods based upon popular consent. A democratic programme of planned economy and public ownership of certain vital industries and services were features of socialist government from 1945–51 together with a comprehensive system of social security. Further radical reforms in the interest of social justice and industrial efficiency are in progress under the socialist government which took office in Oct. 1964. *See also* Section C, Part I.

Southcottians, followers of Joanna Southcott who died in 1814 shortly after announcing to them that (although aged over 50) she was about to give birth to a divine man named Siloh. It spite of the fact that she went through all the actions of a woman about to give birth it is not surprising that no Siloh appeared nor was she pregnant. She also announced that, 100 years after her death, great revelations would be made —but in 1914 people had other things to think about and no revelations were vouchsafed. Yet this unfortunate woman still has her followers who believe that Siloh will appear and that the "true" revelations will be made at some unspecified future date under the right conditions.

It is difficult to decide which is the stranger phenomenon, Joanna or her followers.

Spiritualism is a religion which requires to be distinguished from psychical research (*q.v.*) which is a scientific attempt carried on both by believers and non-believers to investigate psychic phenomena including those not necessarily connected with "spirits"—*e.g.*, telepathy or clairvoyance and precognition. As a religion (although for that matter the whole of history is filled with attempts to get in touch with the "spirit world") spiritualism begins with the American Andrew Jackson Davis who in 1847 published *Nature's Divine Revelations*, a book which is still widely read although it bears traces of the period in which it was written. Thus reference is made to the theories of "Mesmerism" and "magnetic influence" which really belong to the period when hypnosis was described as Mesmerism after the name of its first modern exponent, Anton Mesmer (d. 1815). The division of man into body, soul, and spirit is accepted and it is supposed that the "soul" is simply a sublimation of the body, needing food which after digestion by the body is refined into a more ethereal form. It even takes the actual form of the body which in reality is merely the covering by which soul communicates with the outer world before passing the messages on to the spirit which is a process of the Divine in which it will ultimately be absorbed. As we grow older there is a gradual separation between spirit or soul and the body—a process which Davis claimed to have observed in the clairvoyant state. According to his observations, the soul, still retaining the form of the body from which it was separating, moved above it but was still joined by a tenuous stream of "vital electricity" which Davis compared with the umbilical cord and took some time to vanish. Death in this view is literally a birth-process from a lower to a higher plane.

The earth is surrounded by a series of spheres from lower to higher, and although these are spiritual it is claimed that their actual distance from the centre of the earth can be measured in ordinary miles or metres. Davis supposed that the passage from lower to higher spheres is accompanied by an increase in moral perfection until the spirit is ultimately absorbed in God. In the lower spheres, however, it still retains something of the material which enables mediums to enter into contact with it. Therefore nearly all spiritualist meetings include a séance, and for the rest, there are prayers, sermons, and hymns. There are ministers, lay officers, and mediums; the latter usually are "freelance" and move about from one church to another. It is, as most people are well aware, perfectly possible for capable and knowledgeable men and women to be either "spiritualists" or (more commonly) interested in spiritualism, but for the most part those who attend services are people who come seeking for proof that their loved ones are not dead but have "passed on" and such are unlikely to retain a critical attitude on the subject however hard-headed they may be in other respects. In spite, or perhaps because of this, the Spiritualist Church is one with an ever-increasing membership especially in Britain and America. It is not permitted for Roman Catholics to hold or practise spiritualist beliefs.

State and Man. Most of the early civilisations such as those of Egypt and Babylonia were theocratic, that is to say, they were arranged in a hierarchy with, at the peak, a king who was also an incarnation of the god. Needless to say, in such circumstances there was no room for philosophising about the nature of the state and the relationship which ought to exist between state and citizens. As usual, we have to turn to ancient Greece for the beginnings of thought about this problem. We do so as briefly as possible since in general it is only the later philosophers whose work has much contemporary interest and, in any case, most people today realise that the political philosophy of a particular time is bound to reflect the actual conditions prevailing then and as such is of mainly theoretical interest today.

The Greek Approach. The early pre-Socratic philosophers Democritus and the Pythagorean school, for example, held that the individual should subordinate himself to the whole; they had no doubt that the citizen's first duty was to the state. The Greeks until the time of Plato were not really thinking in terms of individual rights, nor had they given much thought to what form the state should take—they simply accepted it. The first great attempt to describe the ideal state is to be found in Plato's *The Republic* which is referred to elsewhere (*see* Education). His pupil Aristotle did not try to form a utopia but made many comments on the nature of government. Thus, while agreeing that the state was more important than any individual person, he distinguished between good and bad states, and pointed out that to the extent that the state does not enable its citizens to lead virtuous and useful lives it is evil. A good constitution must recognise the inequalities between human beings and confer on them rights according to their abilities; among these inequalities are those of personal ability, property, birth, and status, as freeman or slave. The best forms of rule were monarchy, aristocracy, and democracy; the worst forms—tyranny, oligarchy (or rule of a powerful few), and ochlocracy (or mob-rule). The later Greek thinkers of Hellenistic times held two opposed points of view. The Epicureans (*q.v.*) taught that all social life is based upon self-interest and we become members of a group for our own convenience; therefore there are no absolute rights and laws—what is good is what members decide at that time to be good, and when they change their minds the law must change too. Injustice is not an evil in any god-given sense; we behave justly simply because if injustice became the general rule, we ourselves should suffer. The Stoics (*q.v.*), on the other hand, held that the state must dominate the individual completely and everyone must carry out, first and foremost, his social duties and be willing to sacrifice everything for it; but the state of the Stoics was no narrowly national one, but one that strove to become a universal brotherhood.

The Christian Approach. The orthodox Christian view is expressed in St. Augustine's book *The City of God*. Here it is held that the church, as the worldly incarnation of the City of God, is to be supreme over the state, and the head of the church is to be supreme over secular rulers. In addition it must be recognised that, whilst the secular ruler can make mistakes, the church does not, since it is the representative of God's kingdom on earth.

The Secular State. During the Renaissance (*q.v.*) people began to think for themselves and the results of their cogitations were not always pleasant; for it was during this time that many rulers, petty and otherwise, were seeking absolute authority. Two notable thinkers at this stage were Niccolo Machiavelli (1469–1527) in Italy and Thomas Hobbes (1588–1679) in England, where, of course, the Renaissance arrived later in history. Both supported absolute monarchy against the former domination of the church. The name of Machiavelli has become a by-word for any behaviour that is cunning and unscrupulous, but he was not really as bad as he is usually painted. It is, indeed, true that in his book *The Prince* he showed in the greatest detail the methods by which a ruler could gain absolute control and destroy civic freedom, but this despotism was intended as merely a necessary intermediate stage towards his real idea which was a free, united Italian nation wholly independent of the church. Hobbes was a materialist whose thesis was that man is naturally a ferocious animal whose basic impulse is war and pillage and the destruction of whatever stands in his way to gain his desires. But if he allowed himself to behave in this way his life would be "nasty, brutish, and short" so he creates a society in which he voluntarily gives up many of his rights and hands them over to a powerful ruler in his own interest. But having done this he must obey; even when the ruler is unjust, as he has no right to complain because anything is better than a return to his natural state. The religion of the king must be the religion of the people and the only things on

ruler has the right to do is to cause a man to commit suicide or murder or to make him confess to a crime.

Views of Locke: Live and Let Live. John Locke (1632–1704) disagreed with these views. Man is naturally peaceful and co-operative and therefore social life comes readily to him. He sets up an authority in order to preserve the group and that is why laws are made; but the function of the state is strictly limited to maintaining the public good and beyond this men are to be left free. Therefore absolute power and the doctrine of the Divine Right of Kings were wrong because power ultimately rests with the people who have the right to make and break governments. It is also wrong that those who make the laws should be able to execute them. This is the important British doctrine of the separation of powers between the legislature and the executive which, in Britain and America, is regarded as one of the bases of democracy.

Rousseau's Social Doctrine. The only other views we need consider here are those of Jean-Jacques Rousseau (1712–78) and Herbert Spencer (1820–1903), since the views of the two important intervening figures, Hegel and Karl Marx, are dealt with elsewhere (*see* **Dialectical Materialism**) and after Spencer we come to a stage where political philosophy begins to merge with sociology and the social sciences. Rousseau is a puzzling figure. On the one hand he has been hailed as the prophet of freedom and on the other as the father of modern totalitarianism. His book *Social Contract* (1762) begins with the words: "Man is born free, and everywhere he is in chains." He says that he is in favour, not merely of democracy, but of direct democracy in which everyone has to give his assent to all measures as in the Greek city-states and in Geneva, of which city he was a citizen. (This method is still in force in respect of some measures in the Swiss cantons.) Natural society is based on a "social contract" or mutual agreement and Rousseau speaks of a "return to nature" which would ensure the sovereignty of the people at all times. Thus far, he seems to agree with Locke but soon we find that he is more akin to Hobbes, since (as we are learning in our own day) nothing is more tyrannical than the absolute rule of all the people. (Public opinion is more Hitlerian than Hitler.) As it turns out, then, the "social contract" consists in "the total alienation of each associate, together with all his rights, to the whole community" and "each of us puts his person and all his power in common under the supreme direction of the general will." Rousseau admired direct democracy in the small city-state, but if his doctrine is applied to large states, then the "general will" becomes absolute. It is in this sense that he is regarded as the forerunner of totalitarianism. Herbert Spencer is quoted only as an example of the inappropriate application of a biological theory to social issues. Influenced by Darwin's thesis of natural selection, he saw in society a struggle in which the fittest survived and the less fit perished. Each individual had the right to preserve himself, but in the case of human beings this depended upon group life in which, to some extent, each individual is limited by the rights of others. But this should not go too far, and he condemned the socialism of J. S. Mill which (*a*) would give over-much protection to the unfit, and (*b*) would give the state powers which it has no right to since the best government is the least government. In accordance with Darwinism free competition was essential.

Stoics, the followers of Zeno, a Greek philosopher in the 4th cent. B.C., who received their name from the fact that they were taught in the Stoa Poikile or Painted Porch of Athens. They believed that since the world is the creation of divine wisdom and is governed by divine law, it is man's duty to accept his fate. Zeno conceived virtue to be the highest good and condemned the passions. (*See* **God and Man, State and Man, Determinism and Free-will** for a more detailed account of their beliefs.)

Sunnites, the orthodox sect of Islam as contrasted with the Shiites or Shia (*q.v.*).

Swedenborgianism. The Church of the New Jerusalem, based on the writings of Emanuel Swedenborg (1688–1772), was founded by his followers eleven years after his death. The New Church is regarded by its members not as a sect but as a new dispensation bearing the same relationship to Christianity as Christianity does to Judaism.

Syndicalism, a form of socialist doctrine which aims at the ownership and control of all industries by the workers, contrasted with the more conventional type of socialism which advocates ownership and control by the state. Since syndicalists have preferred to improve the conditions of the workers by direct action, *e.g.* strikes and working to rule, rather than through the usual parliamentary procedures, they have been closely related to anarchists (*q.v.*) and are sometimes described as anarcho-syndicalists. Under syndicalism there would be no state; for the state would be replaced by a federation of units based on functional economic organisation rather than on geographical representation. The movement had bodies in the United Kingdom, where guild socialism (*q.v.*) was strongly influenced by its doctrines, in France, Germany, Italy, Spain, Argentina, and Mexico, but these gradually declined after the first world war losing many members to the communists. Fascism (*q.v.*) was also strongly influenced by the revolutionary syndicalism of Georges Sorel in making use of his concept of the "myth of the general strike" as an emotional image or ideal goal to spur on the workers; with Mussolini the "myth" became that of the state. Mussolini was also influenced by Sorel's doctrine of violence and the justification of force. Syndicalism had a certain influence in the Labour Party in its early days, but was crushed by men like Ernest Bevin who began to fear that by involving the workers in direct responsibility for their industries, it would put them at a disadvantage when bargaining for wages

T

Taoism, a religion which, although in a degenerate state, is still one of the great Eastern creeds. Its alleged founder, Lao-tze, is said to have been born in Honan about 604 B.C.; he is also said to be the author of the bible of Taoism, the *Tao-te-ching*, or in English *The Way of Life*, and to have disapproved of Confucius. This, if true, would hardly be surprising; for Taoism is eminently a mystical religion recommending doing nothing and resisting nothing, whereas **Confucianism** (*q.v.*) is eminently a practical code of living and its founder insisted on intervening in everything to do with social life. But the truth as revealed by modern scholarship is rather different. We are told that the poems of the *Tao-te-ching* are anonymous and probably originated among recluses in lonely valleys long before the time of Confucius; they were collected and given form at some time late in the 3rd cent. B.C. and their authorship attributed to Lao-tze. It is entirely possible that no such person ever existed (unlike Confucius, who certainly did), but if there were such a man he appears to have used a pseudonym since "Lao" is not a surname but an adjective meaning "old" and it was customary to attribute important works to old men on account of their supposed wisdom. Lao-tze simply means "the old philosopher," and although the *Tao-te-ching* is one of the most remarkable and instructive books ever written it is as anonymous as the Border Ballads.

It is apparent that the religion learned both from the ancient Chinese mystics and from Brahmanism: *Tao*, the Way, is impalpable, invisible, and incapable of being expressed in words. But it can be attained by virtue, by compassion, humility, and non-violence. Out of weakness comes true strength whereas violence is not only wrong but defeats its own ends. There is no personal God and such gods as men imagine are mere emanations of *Tao* which gives life to all things. *Tao* is Being. Works are worthless and internal renunciation is far better than anything that follows from the use of force because passive resistance convinces the other from within that he is in error, whereas violence only compels the external ap-

pearance of conviction whilst inwardly the individual is as before. "It is wealth to be content; it is wilful to force one's way on others."

Later Lao-tze became a divinity and indeed one of a Trinity each worshipped in the form of idols (which the founder had hated). Soon there was worship of the forces of nature: the stars, the tides, the sun and moon, and a thousand other deities among whom Confucius was one. The purest mysticism and wisdom had been utterly corrupted by contact with the world.

Telepathy and Clairvoyance. Telepathy is the alleged communication between one mind and another other than through the ordinary sense channels. Clairvoyance is the supposed faculty of "seeing" objects or events which, by reason of space and time or other causes, are not discernible through the ordinary sense of vision. Such claims have been made from time immemorial but it was not until this century that the phenomena were investigated scientifically. The first scientific studies were made by the Institute for Psychical Research. A new era in experimentation began with the work of J. B. Rhine at Duke University, North Carolina, and S. G. Soal of London University. The most common technique is card guessing using a special pack of cards with the Zener symbols (circle, square, cross, wavy lines, star), thus giving the subject one chance in five of guessing correctly. Although the results obtained have led to the conclusion that telepathic communication is a fact, scepticism still exists, partly because of criticism of the methods employed, the validity of the data obtained, and the assumptions drawn, and partly because telepathic theory appears to clash with existing scientific thought. Dr. Rhine uses the term extra-sensory perception (abbreviated to ESP) to include telepathy, clairvoyance, and precognition. His studies also include what is described as the PK effect or psychokinesis, the supposed influence of the human mind on the movements of physical bodies. The Psi force is the term used for the faculty behind ESP and PK. Reference should be made to the entry on **Psychical Research** in order to obtain the background relating to the various fallacies involved in accepting human evidence uncritically.

Theism. *See* **God and Man.**

Theosophy, a religious movement originated by Madame Helena Petrovna Blavatsky (1831–91) who founded the Theosophical Society in New York in 1875 and had as one of her main disciples Mrs. Annie Besant (1847–1933), originally an assistant of Charles Bradlaugh, the well-known 19th cent. atheist and secularist. Theosophy accepts the doctrines of *karma* and reincarnation, and, like the Swedenborgians and spiritualists, holds that there are higher and lower planes in the life after death. As in these other sects, the geography of this supernormal world is worked out in great detail.

Tractarianism, a Catholic revival movement, also known as the **Oxford Movement** (not to be confused with the so-called Oxford Group), which had its beginnings at Oxford in 1833. The leaders included the Oxford high churchmen E. B. Pusey, J. Keble and J. H. Newman. Through the *Tracts for the Times* (1833–41), a series of pamphlets which were sent to every parsonage in England, they sought to expose the dangers which they considered to be threatening the church from secular authority. The immediate cause of the movement was the Reform Act (1832) which meant that the state was no longer in the safe keeping of Tories and Churchmen but that power was falling into the hands of Liberals and Dissenters. They advocated a higher degree of ceremonial in worship nearer the Roman communion. In *Tract 90* (the last) Newman showed how the Thirty-nine Articles themselves, which were regarded as the bulwark of Protestantism, could be made to square with Roman doctrine. It was obvious which direction the movement was taking and the romanizing tendency was widely resented. In 1845 Newman went over to Rome. Pusey and Keble persisted in their efforts to secure recognition of Catholic liturgy and doctrine in the Anglican Church. Catholicism of the Anglican type (*i.e.*, Catholic in ritual, ceremony, and everything save submission to the Pope) is termed Anglo-Catholicism (*q.v.*).

Transmigration of Souls. *See* **Immortality, Buddhism, Hinduism.**

Transubstantiation, the conversion in the Eucharist of the bread and wine into the body and blood of Christ—a doctrine of the Roman Catholic Church.

Trotskyism, a form of communism supporting the views of Leon Trotsky, the assumed name of Lev Bronstein (1879–1940) who, in 1924, was ousted from power by Stalin and later exiled and assassinated in Mexico. Trotsky held that excessive Russian nationalism was incompatible with genuine international communism and that Stalin was concentrating on the economic development of the Soviet Union to an extent which could only lead to a bureaucratic state with a purely nationalist outlook.

U

Unitarianism has no special doctrines, although clearly, as the name indicates, belief is in the single personality of God, *i.e.*, anti-trinitarian. This general statement, however, can be interpreted with varying degrees of subtlety. Thus unitarian belief may range from a sort of Arianism which accepts that, although Christ was not of divine nature, divine powers had been delegated to him by the Father, to the simple belief that Christ was a man like anyone else, and his goodness was of the same nature as that of many other great and good men. Indeed, today, many Unitarians deny belief in a personal God and interpret their religion in purely moral terms, putting their faith in the value of love and the brotherhood of man. The Toleration Act (1689) excluded Unitarians but from 1813 they were legally tolerated in England. Nevertheless attempts were made to turn them out of their chapels on the ground that the preachers did not hold the views of the original founders of the endowments. But this ended with the Dissenting Chapels Act of 1845. In America no such difficulties existed, and in the Boston of the 19th cent. many of the great literary figures were openly unitarian both in belief and name: *e.g.*, Emerson, Longfellow, Lowell, and Oliver Wendell Holmes.

Utilitarianism, a school of moral philosophy of which the main proponents were J. S. Mill (1806–73) and Jeremy Bentham (1748–1832). Bentham based his ethical theory upon the utilitarian principle that the greatest happiness of the greatest number is the criterion of morality. What is good is pleasure or happiness; what is bad is pain. If we act on this basis of self-interest (pursuing what we believe to be our own happiness), then what we do will automatically be for the general good. The serious failing of this thesis is (1) that it makes no distinction between the quality of one pleasure and another, and (2) that Bentham failed to see that the law might not be framed and administered by men as benevolent as himself. J. S. Mill accepted Bentham's position in general but seeing its failings emphasised (1) that self-interest was an inadequate basis for utilitarianism and suggested that we should take as the real criterion of good the social consequences of the act; (2) that some pleasures rank higher than others and held that those of the intellect are superior to those of the senses. Not only is the social factor emphasised, but emphasis is also placed on the nature of the act.

Utopias. The name "utopia" is taken from a Greek word meaning "nowhere" and was first used in 1516 by Sir Thomas More (1478–1535) as the title of his book referring to a mythical island in the south Pacific where he sited his ideal society. Since then it has been used of any ideal or fanciful society, and here a few will be mentioned. (The reader may recall that Samuel Butler's 19th cent. novel, describing an imaginary society in New Zealand where criminals were treated and the sick punished, was entitled *Erewhon* which is the word "nowhere" in reverse.) It should be noted that not all utopias were entirely fanciful—*e.g.*, Robert Owen's and François Fourier's beliefs, although found to be impractical, were, in fact, tried out.

Sir Thomas More. More wrote at a time

when the rise of the wool-growing trade had resulted in farming land being turned over to pasture and there was a great wave of unemployment and a rise in crime among the dispossessed. More began to think in terms of the mediaeval ideal of small co-operative communities in which class interests and personal gain played a decreasing part, a society which would have the welfare of the people at heart both from the physical and intellectual points of view. His utopia was one in which there was no private property, because the desire for acquisition and private possessions lay at the root of human misery. There was, therefore, only common ownership of land and resources. Each class of worker was equipped to carry out its proper function in the economic scheme and each was fairly rewarded for its share in production so that there was neither wealth nor poverty to inspire conflict. Nobody was allowed to be idle, until the time came for him to retire when he became free to enjoy whatever cultural pleasures he wished, but, since the system was devoid of the waste associated with competition, the working day would be only six hours. There was to be compulsory schooling and free medical care for everybody, full religious toleration, complete equality of the sexes, and a modern system of dealing with crime which was free from vindictiveness and cruelty. Government was to be simple and direct by democratically-elected officials whose powers would be strictly limited and the public expenditure kept under close scrutiny. It will be seen that More was far in advance of his age, and to most democratically-minded people in advance of an earlier utopia, Plato's *Republic*, which is described under the heading of Education.

James Harrington. James Harrington published his book *The Commonwealth of Oceana* in 1656 and offered it to Oliver Cromwell for his consideration but without tangible results. Better than any other man of his time Harrington understood the nature of the economic revolution which was then taking place, and, like More, saw the private ownership of land as the main cause of conflict. He put forward the theory that the control of property, particularly in the shape of land, determines the character of the political structure of the state; if property were universally distributed among the people the sentiment for its protection would naturally result in a republican form of government. The Commonwealth of Oceana was a society "of laws and not of men"—*i.e.*, it was to be legally based and structured so as to be independent of the good or ill-will of any individuals controlling it. Thus there must be a written constitution, a two-house legislature, frequent elections with a secret ballot, and separation of powers between legislature and executive—all today familiar features of parliamentary democracy, but unique in his time.

Saint-Simon. The utopias of the late 18th and 19th cent. come, of course, into the period of the industrial revolution and of laissez-faire capitalism. Individual enterprise and complete freedom of competition formed the outlook of the ruling class. Naturally the utopias of this period tended to have a strongly socialist tinge since such theories are obviously produced by those who are not satisfied with existing conditions. Saint-Simon's *New Christianity* (1825) is one such, and by many, Claude Henri, Comte de Saint-Simon (1760–1825) is regarded as the founder of French socialism. His book urged a dedication of society to the principle of human brotherhood and a community which would be led by men of science motivated by wholly spiritual aims. Production property was to be nationalised (or "socialised" as he describes the process) and employed to serve the public good rather than private gain; the worker was to produce according to his capacity and to be rewarded on the basis of individual merit; the principle of inheritance was to be abolished since it denied the principle of reward for accomplishment on which the society was to be founded. Saint-Simon's proposals were not directed towards the poorer classes alone, but to the conscience and intellect of all. He was deeply impressed with the productive power of the new machines and his scheme was, first and foremost, intended as a method of directing that power to the betterment of humanity as a whole.

Fourier. Francois Marie Charles Fourier (1772–1837), although by conviction a philosophical anarchist who held that human beings are naturally good if allowed to follow their natural desires, was the originator of what, on the face of it, one would suppose to be the most regimented of the utopias. It consisted of a system of "phalanxes" or co-operative communities each composed of a group of workers and technicians assured of a minimum income and sharing the surplus on an equitable basis. Agriculture was to be the chief occupation of each phalanx and industrial employment planned and so carefully assigned that work would become pleasant and creative rather than burdensome. One of his ideas was that necessary work should receive the highest pay, useful work the next, and pleasant work the least pay. The land was to be scientifically cultivated and natural resources carefully conserved. Most of the members' property was to be privately owned, but the ownership of each phalanx was to be widely diffused among members by the sale of shares. Such "parasitic and unproductive" occupations as stockbroker, soldier, economist, middle-man and philosopher would be eliminated and the education of children carried out along vocational lines to train them for their future employment.

The strange thing was that Fourier's suggestions appealed to many both in Europe and the U.S.A. and such men (admittedly no economic or technical experts) as Emerson, Thoreau, James Russell Lowell, and Nathaniel Hawthorne strongly supported them. An American Fourier colony known as Brook Farm was established and carried on for eight years when it was dissolved after a serious fire had destroyed most of its property.

Robert Owen. Robert Owen (1771–1858), a wealthy textile manufacturer and philanthropist, established communities founded on a kind of utopian socialism in Lanarkshire, Hampshire, and in America. Of his New Lanark community an American observer wrote: "There is not, I apprehend, to be found in any part of the world, a manufacturing community in which so much order, good government, tranquillity, and rational happiness prevail." The workers in Lanark were given better housing and education for their children, and it was administered as a co-operative self-supporting community in Scotland. Later in life Owen returned to sponsoring legislation that would remove some of the worst evils of industrial life in those days: reduction of the working day to twelve hours, prohibition of labour for children under the age of ten, public schools for elementary education, and so on. But he lived to see few of his reforms adopted. He also promoted the creation of co-operative societies, the formation of trades unions, labour banks and exchanges, the workers' educational movement, and even an Anglo-American federation. There can be no doubt that, if he saw little result himself, he left the imprint of his convictions to benefit future communities who may not even know his name.

V

Vitalism, the philosophical doctrine that the behaviour of the living organism is, at least in part, due to a vital principle which cannot possibly be explained wholly in terms of physics and chemistry. This belief was at one time held strongly by the late Professor C. E. M. Joad and is implicit in Henri Bergson's (1859–1941) theory of creative evolution. It was maintained by Bergson that evolution, like the work of an artist, is creative and therefore unpredictable; that a vague need exists beforehand within the animal or plant before the means of satisfying the need develops. Thus we might assume that sightless animals developed the need to become aware of objects before they were in physical contact with them and that this ultimately led to the origin of organs of sight. Earlier this century a form of vitalism described as "emergent evolution" was put forward. This theory maintains that when

two or more simple entities come together there may arise a new property which none of them previously possessed. Today biologists would say that it is the *arrangement* of atoms that counts, different arrangements exhibiting different properties, and that biological organisation is an essentially dynamic affair, involving the lapse of time.

W

Wahabis, members of an Arabian sect of Islam which originated in the teaching of Muhammad Ibn 'Abd-al-Wahab, born at the end of the 17th cent. He was deeply resentful of the Turkish rule which, in addition to its tyranny, had brought about innovations in the religion which Muhammad regarded as a perversion of its original form. He proceeded to reform Islam to its primitive conditions and impressed his beliefs on Mohammed Ibn Saud, a sheikh who spread them with the aid of his sword. Under the successors of Ibn Saud the power of the Wahabis spread over much of Arabia where it is dominant today in Saudi Arabia. Its particular characteristic is that it refuses to accept symbolic or mystical interpretations of the words of the Prophet and accepts quite literally the teaching of Islam. It is, in fact, a sort of Moslem fundamentalism. Although crushed by the Turks in 1811–15, the movement remains an important element in Mohammedanism.

Waldenses, a movement also known as "The Poor Men of Lyons," founded by Peter Waldo of that city about the same time, and in the same part of southern France, as the Albigenses (*q.v.*) with whom, however, they had nothing in common. Their main belief was a return to Apostolic simplicity, based on reading the Bible in their own language; their doctrines were somewhat similar to those of the Mennonites and the Quakers. However, they did not wish to separate themselves from the Church and were originally protected by several popes until the Lateran Council of 1215 excluded them mainly for the crime of preaching without ecclesiastical permission. From this time they were subjected to persecution, yet maintained some contact with the Church until the Reformation when they chose to take the side of the Protestants. Situated mainly on the sides of the Alps, half in Piedmont and half in France, they were persecuted or not according to the contemporary political convenience of the Dukes of Savoy, and the major attempt to destroy them called forth Oliver Cromwell's intervention and the famous sonnet of Milton. In spite of torture, murder, deportation, and even the kidnapping of their children, to have them brought up in the Roman Catholic faith, the sect survived, and still exists, having been granted full equality of rights with his Roman Catholic subjects by Charles Edward of Piedmont in 1848.

Witchcraft. There are various interpretations and definitions of witchcraft from that of Pennethorne Hughes who states that "witchcraft, as it emerges into European history and literature, represents the old paleolithic fertility cult, plus the magical idea, plus various parodies of contemporary religions" to that of the fanatical Father Montague Summers who says that spiritualism and witchcraft are the same thing. A leading authority on witchcraft, however, the late Dr. Margaret Murray, distinguishes between Operative Witchcraft (which is really Magic (*q.v.*)) and Ritual Witchcraft which, she says, "embraces the religious beliefs and ritual of the people known in late mediaeval times as 'witches.'" That there were such people we know from history and we know, too, that many of them—the great majority of them women—were tortured or executed or both. Many innocent people perished, especially after the promulgation of the bull *Summis desiderantes* by Pope Innocent VIII in 1484. Himself "a man of scandalous life", according to a Catholic historian, he appointed as inquisitors "of these heretical pravities" Kramer and Sprenger, who in 1494 codified in textbook form in the *Malleus Maleficarum* (Hammer of Witches) the ecclesiastical rules for detecting acts of witchcraft. Dr. Murray points out that there have ordinarily been two theories about witchcraft: (1) that there were such beings as witches, that they possessed supernatural powers and that the evidence given at their trials was substantially correct; (2) that the witches were simply poor silly creatures who either deluded themselves into believing that they had certain powers or, more frequently, were tortured into admitting things that they did not do. She herself accepts a third theory: that there were such beings as witches, that they really did what they admitted to doing, but that they did not possess supernatural powers. They were in fact believers in the old religion of pre-Christian times and the Church took centuries to root them out. What this religion was is not quite certain, but it may have been the remains of the Druidic cult (*q.v.*) or have had much earlier origins. However, that there existed "covens" of witches who carried out peculiar rites Dr. Murray has no doubt whatever. The first to show that witchcraft was a superstition and that the majority of so-called witches were people suffering from mental illness was the physician Johann Weyer of Cleves (1515–88). His views were denounced by the Catholic Church.

World Council of Churches, a union of Christian Churches from all over the world (including the Churches of the Protestant, Anglican, and Orthodox traditions, but excluding the Roman Catholic Church), engaged in extending Christian mission and unity throughout the world. All Churches which "accept our Lord Jesus Christ as God and Saviour" are eligible. This modern ecumenical movement stems from the great World Missionary Conference held at Edinburgh in 1910. The World Council was founded in 1948 and meets for consultation from time to time; the third assembly met in New Delhi in 1961, when the Russian Orthodox Church was admitted.

Y

Yoga, a Hindu discipline which teaches a technique for freeing the mind from attachment to the senses, so that once freed the soul may become fused with the universal spirit (*Atman* or *Brahma*), which is its natural goal. This is the sole function of the psychological and physical exercises which the Yogi undertakes, although few ever reach the final stage of *Samadhi* or union with *Brahma* which is said to take place in eight levels of attainment. These are: (1) *Yama*, which involves the extinction of desire and egotism and their replacement by charity and unselfishness; (2) *Niyama* during which certain rules of conduct must be adopted, such as cleanliness, the pursuit of devotional studies, and the carrying out of rituals of purification; (3) *Asana*, or the attainment of correct posture and the reduction to a minimum of all bodily movement (the usual posture of the concentrating Yogi is the "lotus position" familiar from pictures); (4)–(5) *Pranayama*, the right control of the life-force or breath in which there are two stages at which the practitioner hopes to arrive, the first being complete absorption in the act of breathing which empties the mind of any other thought, the second being the ability almost to cease to breathe which allegedly enables him to achieve marvellous feats of endurance; (6) *Pratyahara* or abstraction which means the mind's complete withdrawal from the world of sense; (7) *Dharana* in which an attempt is made to think of one thing only which finally becomes a repetition of the sacred syllable OM, and perhaps by a kind of self-hypnosis, leads (8) to *Samadhi* the trance state which is a sign of the complete unity of soul with reality.

Yoga is very old, and when the sage Patanjali (*c.* 300 B.C.) composed the book containing these instructions, the *Yoga Sutras*, he was probably collecting from many ancient traditions. Some of the claims made by Yogis seem, to the Western mind, frankly incredible; but in the West and especially in recent years Yoga methods have been used at the lower levels in order to gain improved self-control, better posture, and improved health. Whether it achieves these ends is another matter, but the genuine Yogi regards this as a perversion of the nature and purpose of the discipline.

Z

Zen Buddhism, a Buddhist sect which is believed to have arisen in 6th cent. China but has flourished chiefly in Japan; for some reason it has of recent years begun to attract attention in the West thanks to the voluminous writings of Dr. D. T. Suzuki and the less numerous but doubtless much-read books of Mr. Christmas Humphreys. But the fact that these writings exist does not explain their being read, nor why of all possible Eastern sects this particular one should be chosen in our times. What is Zen's attraction and why should anyone take the trouble to read about something (the word "something" is used for reasons that will become evident) that is not a religion, has no doctrine, knows no God and no after-life, no good and no evil, and possesses no scriptures but has to be taught by parables which seem to be purposely meaningless? One of the heroes of Zen is the fierce-looking Indian monk Boddhidharma (fl. c. 516–534) who brought Buddhism to China, of whom it is recounted that when the Emperor asked him how much merit he had acquired by supporting the new creed, the monk shouted at him: "None whatever!" The Emperor then wished to know what was the sacred doctrine of the creed, and again the monk shouted: "It is empty—there is nothing sacred!" Dr. Suzuki, having affirmed that there is no God in Zen, goes on to state that this does not mean that Zen denies the existence of God because "neither denial nor affirmation concerns Zen." The most concrete statement he is prepared to make is that the basic idea of Zen is to come in touch with the inner workings of our being, and to do this in the most direct way possible without resorting to anything external or superadded. Therefore anything that has the semblance of an external authority is rejected by Zen. Absolute faith is placed in a man's own inner being. Apparently the intention is that, so far from indulging in inward meditations or such practices as the Yogi uses, the student must learn to act spontaneously, without thinking, and without self-consciousness or hesitation. This is the main purpose of the *koan* the logically insoluble riddle which the pupil must try to solve. One such is the question put by master to pupil: "A girl is walking down the street, is she the younger or the older sister?" The correct answer, it seems, is to say nothing but put on a mincing gait, to *become* the girl, thus showing that what matters is the experience of being and not its verbal description. Another *koan*: "What is the Buddha?" "Three pounds of flax" is attributed to T'ung-shan in the 9th cent. and a later authority's comment is that "none can excel it as regards its irrationality which cuts off all passages to speculation." Zen, in effect, teaches the uselessness of trying to use words to discuss the Absolute.

Zen came to Japan in the 13th cent., more than five centuries after Confucianism or the orthodox forms of Buddhism, and immediately gained acceptance whilst becoming typically Japanese in the process. One of the reasons why it appealed must have been that its spontaneity and insistence on action without thought, its emphasis on the uselessness of mere words, and such categories as logical opposites, had an inevitable attraction for a people given to seriousness, formality, and logic to a degree which was almost stifling. Zen must have been to the Japanese what nonsense rhymes and nonsense books, like those of Edward Lear and Lewis Carroll, were to the English intellectuals. Lear's limericks, like some of the *koans*, end up with a line which, just at the time when one expects a point to be made, has no particular point at all, and *Alice in Wonderland* is the perfect example of a world, not without logic, but with a crazy logic of its own which has no relationship to that of everyday life. Therefore Zen began to impregnate every aspect of life in Japan, and one of the results of its emphasis on spontaneous action rather than reason was its acceptance by the Samurai, the ferocious warrior class, in such activities as swordsmanship, archery, Japanese wrestling, and later Judo and the Kamikaze dive-bombers. But much of Japanese art, especially landscape gardening and flower-arrangement, was influenced similarly, and Zen is even used in Japanese psychiatry. The very strict life of the Zen monks is based largely on doing things, learning through experience; the periods of meditation in the Zendo hall are punctuated by sharp slaps on the face administered by the abbot to those who are unsatisfactory pupils. Dr. Suzuki denies that Zen is nihilistic, but it is probably its appearance of nihilism and its appeal to the irrational and spontaneous which attracts the Western world at a time when to many the world seems without meaning and life over-regimented. However, it has influenced such various aspects of Western life as philosophy (Heidegger), psychiatry (Erich Fromm and Hubert Benoit), writing (Aldous Huxley), and painting (Die Zen Gruppe in Germany).

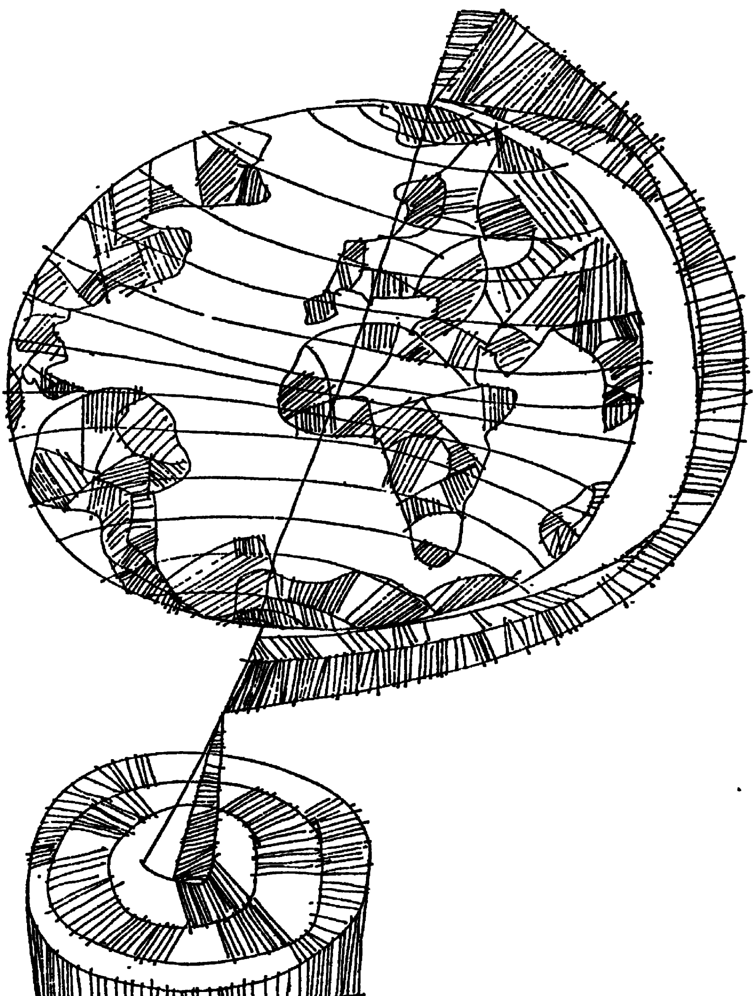
Zionism, a belief in the need to establish an autonomous Jewish home in Palestine which, in its modern form, began with Theodor Herzl (1860–1904), a Hungarian journalist working in Vienna. Although Herzl was a more or less assimilated Jew, he was forced by the Dreyfus case and the pogroms in Eastern Europe to conclude that there was no real safety for the Jewish people until they had a state of their own. The Jews, of course, had always in a religious sense thought of Palestine as a spiritual homeland and prayed "next year in Jerusalem," but the religious had thought of this in a philosophical way as affirming old loyalties, not as recommending the formation of an actual state. Therefore Herzl was opposed both by many of the religious Jews and, at the other extreme, by those who felt themselves to be assimilated and in many cases without religious faith. Even after the Balfour Declaration of 1917, there was not a considerable flow of Jews to Palestine, which at that time was a predominantly Arab state. But the persecutions of Hitler changed all this and, after bitter struggles, the Jewish state was proclaimed in 1948. Today Zionism is supported by the vast majority of the Jewish communities everywhere (although strongly disapproved of in the Soviet Union as "Western imperialism") and Zionism is now an active international force concerned with protecting the welfare and extending the influence of Israel.

Zoroastrianism, at one time one of the great world religions, competing in the 2nd cent. A.D. on almost equal terms from its Persian home with Hellenism and the Roman Imperial Government. Under the Achaemenidae (c. 550–330 B.C.) Zoroastrianism was the state religion of Persia. Alexander's conquest in 331 B.C. brought disruption but the religion flourished again under the Sassanian dynasty (A.D. c. 226–640). With the advance of the Mohammedan Arabs in the 7th cent. Zoroastrianism finally gave way to Islam. A number of devotees fled to India there to become the Parsees. In Persia itself a few scattered societies remain.

The name Zoroaster is the Greek rendering of Zarathustra, the prophet who came to purify the ancient religion of Persia. It is thought that he lived at the beginning of the 6th cent. B.C. He never claimed for himself divine powers but was given them by his followers. The basis of Zoroastrianism is the age-long war between good and evil, Ahura Mazda heading the good spirits and Ahriman the evil ones. Morality is very important since by doing right the worshipper is supporting Ahura Mazda against Ahriman, and the evil-doers will be punished in the last days when Ahura Mazda wins his inevitable victory.

The sacred book of this religion is the *Avesta*. If Zoroastrianism has little authority today, it had a very considerable influence in the past. Its doctrines penetrated into Judaism (*q.v.*) and, through Gnosticism, Christianity. The worship of Mithra by the Romans was an impure version of Zoroastrianism. Manichaeism (*q.v.*) was a Zoroastrian heresy and the Albigensianism of mediaeval times was the last relic of a belief which had impressed itself deeply in the minds of men.

GAZETTEER OF THE WORLD



GAZETTEER OF THE WORLD

This edition of the gazetteer has been revised from standard and authoritative sources. For the population figures the latest censuses have been used, where available, and where not available, the latest official estimates.

An endeavour has been made to include all the more important places throughout the world. The small scale of the maps included in the Cyclopædia does not enable all places included in the gazetteer to be named on the maps.

In regard to the spelling of place names, the general principle followed has been to adopt national spellings. For those countries where the Latin Alphabet is not used, the principles for transliteration laid down by the " Permanent Committee on Geographical Names " of the Royal Geographical Society have been followed. Chinese entries are in the conventional English form. New official Chinese form, based on Chinese romanised alphabet adopted 1958, is in brackets. There may be a few instances where the spelling shown on the map does not conform to that used in the gazetteer.

ABBREVIATIONS USED IN THE GAZETTEER

Geographical Names

Ala. = Alabama.
Ark. = Arkansas.
A.S.S.R. = Autonomous Soviet Socialist Republic.
Atl. Oc. = Atlantic Ocean.
B.C. = British Columbia.
Brit. = British.
Cal. = California.
Col. = Colorado.
Conn. = Connecticut.
CSSR = Czechoslovak Socialist Republic.

Abidjan, *cap.*, Ivory Coast, W. Africa; palm oil, cocoa, copra, hardwood, rubber; oil refining at Vridi nearby; p. (1963) *212,000*.
Abilene, *t.*, Texas, U.S.A.; univ.; food prod., oilseeds, oil-refining, cotton; p. (1960) *90,368*.
Abingdon, *mun. bor.*, Berks, Eng., on R. Thames; cars, leather goods; p. (1961) *14,283*.
Abingdon, *t.*, Va., U.S.A.; lumbering, flour milling; mnfs. condensed milk, chemicals, tobacco; tourist resort; p. (1960) *4,758*.
Abington, *t.*, Mass., U.S.A.; shoes, textile machin.; p. (1960) *10,449*.
Abitibi, *R.* and *L.*, R. flows into James Bay, Ontario, Canada; gold dist.
Abo, *see* **Turku, Finland.**
Abomey, *old cap.*, Dahomey, W. Africa; former slave mkt.; cotton; p. (estd. 1960) *18,900*.
Abovyan, *t.*, Armenian S.S.R.; 10 m. from Yerevan; new model t. founded 1963; planned p. *50,000*.
Aboyne and Glentanner, *par.*, Aberdeen. Scot.; hol. res. on R. Dee nr. Ballater; p. (1951) *1,651*.
Abraham, Plains of, nr. Quebec; Wolfe's victory over French under Montcalm, 1759.
Abram, *urb. dist.*, Lancs, Eng.; coal, engin., cotton mnfs.; p. (1961) *6,017*.
Abrantes, *t.*, Portugal, on the Tagus R.; French won battle here in Napoleonic Wars, 1807.
Abruzzi, *region* of Italy on the Adriatic, inc. provs. of Aquila, Chieti, Teramo; p. (1961) *1,584,777*.
Abu, *mtn.*, Rajasthan, India, 5,653 ft.; Jain temples.
Abukir or **Aboukir,** *vil.* on Abukir Bay, U.A.R.; site of ancient Canopus; Battle of the Nile fought in the Bay, 1798; p. *7,086*.
Abu Simbel, Nile Valley, U.A.R.; famous anc. temples carved out of solid sandstone, one to Rameses II and the other to his Queen; rescue operation from rising waters behind Aswan High Dam undertaken.
Abydos, *ruined c.*, Upper U.A.R.; celebrated for its temple of Osiris.
Abydos, *ruined castled t.*, Anatolia on the Dardanelles, which resisted Philip of Macedon; famous for the story of Leander and Hero.
Abyssinia, *see* **Ethiopia.**
Acadia or **Acadie,** French name applied to previous possessions S. of St. Lawrence R., inc. Nova Scotia and New Brunswick and part of Maine.
Acajutla, *spt.*, Salvador, Central America; exp. coffee; cement, oil refining, fertilisers; p. (1960) *15,475*.
Acambaro, *t.*, Mexico; rly. junction; p. *17,643*.
Acapulco, *spt.*, Pacific coast, Mexico; tourism; exp. hides, cedar, fruit; p. (1960) *28,582*.
Accra, *spt.*, *cap.* Ghana, W. Africa; univ.; airport; p. (1960) *491,060* (inc. cap. dist. and rural a.)
Accrington, *mun. bor.*, *mftg. t.*, Lancs, Eng.; 20 m. N. of Manchester; cotton ctr., coal, textile machin., engin., bricks; p. (1961) *40,987*.
Acerra, *t.*, S. Italy; destroyed by Hannibal 216 B.C.; restored 210 B.C.; olive oil, wine, hemp; p. *16,460*.
Achaia, *prov.*, Greece; a. 1,206 sq. m.; chief currant-producing dist.; spt., Patras; p. (1961) *236,770*.
Achalpur, *t.*, W. Madhya Pradesh, India; cotton.
Achill, *I.*, off the W. coast of Mayo, Ireland; agr., fishing.
Achill Head, *cape*, Mayo.
Achinsk, *industl. t.*, R.S.F.S.R., on R. Chulym; impt. rly. junction; manganese, cement; p. (1956) *42,400*.
Acireale, *spt.*, Sicily: sulphur baths; p. (1961) *[43,752*.
Acklin, *island*, Bahamas, W. Indies; timber, sponges; p. (1953) *1,273*.

Aconcagua, *mtn.*, Andes, Argentine, S. America, highest peak of New World, alt. 22,835 ft.
Aconcagua, *prov.*, Chile; a. 3,939 sq. m.; cap. San Felipe; alfalfa and Mediterranean fruits; p. (1957) *154,075*.
Aconquija, Sierra de, *mtn. range*, N. Argentina, S America; rises steeply from Chaco lowland to 18,000 ft.
Acqui, *ancient walled t.*, N. Italy, prov. Alessandria; famous cath., sulphur springs; p. *18,975*.
Acre (Akka), *c.*, *spt.*, Israel, famous for its sieges during Crusades and in 1799 withstanding Napoleon for 61 days; p *c. 18,000*.
Acre, *st.*, Brazil; a. 59,139 sq. m., cap. Rio Branco; rubber; p. (1960) *160,208*.
Acton, *former mun. bor.*, Middlesex, Eng.; now inc. in Ealing outer bor., Greater London. (*q.v.*), univ.
Ada, *t.*, Oklahoma, U.S.A.; p. (1960) *14,347*.
Adamawa, *prov.*, W. Africa, divided between Nigeria and Cameroun; a. 70,000 sq. m.; ivory, groundnuts.
Adams, *mftg. t.*, Mass., U.S.A.; paper, cottons, woollens, calcium quarrying; p. (1960) *11,949*.
Adam's Bridge, chain of sandbanks, 22 m. long, in Palk Strait, between India and Ceylon. Construction of rail causeway mooted.
Adam's Peak, *sacred mtn.*, S. Ceylon, alt. 7,352 ft.
Adana, *t.*, Turkey; on R Seihan; wool, cotton, grain, tobacco; p. (1965) *290,515*.
Adapazari, *t.*, Turkey; rly. junction; agr. and tr. ctr., silk, linen; high grade concentrate from low grade iron ore deposits in Camdagi a.; p. (1965) *85,579*.
Adda, *R.*, N. Italy, flows through L. Como to R. Po.
Addis Ababa, *cap.* Ethiopia; terminus of Jibuti rly.; p. (1960) *450,000*.
Adelaide, *c.*, *spt.*, *cap.*, S. Australia; on R. Torrens, which flows into G. of St. Vincent; transcontinental rly. connections; inds. using wool, leather, iron; exp. wheat, wool, wine, ores; univ.; oil refinery on St. Vincent's G.; p. (with subs) (1961) *587,656*.
Adelboden, *t.* Bern can., Switzerland; 19 m. S.W. of Interlaken; health resort, mineral springs.
Adélie Land, Antarctica; French terr. and dependency of Réunion.
Adelsburg, *t.*, Jugoslavia; 20 m N.E. of Trieste; extensive grotto and stalactite cavern.
Aden, *spt.*, Southern Yemen (1967), S. Arabia, former Brit. col.; bay behind headlands of Aden t. and Little Aden, excellent anchorage. *See also* **Yemen, Southern.**
Aden, Gulf of, Arabian Sea; 48 m. l., 180 m. wide.
Aderno, *t.*, Sicily, Italy; at base of Mt. Etna, ancient ruins; p. *24,307*.
Adige, *R.* in N. Italy; enters Adriatic N. of Po, length 240 m.
Adirondacks, *mtns.*, N.Y., U.S.A.; highest peak, Mt. Marcy, 5,345 ft.
Adiyaman, *t.*, Turkey; p. (1960) *17,021*.
Adlington, *urb. dist.*, Lancs, Eng.; nr. Chorley; cotton, coal-mining; p. (1961) *4,281*.
Admiralty G., N.W. of Western Australia.
Admiralty I., off Alaska mainland; belongs to U.S.A.; fishing, timber.
Admiralty Is, S.W. Pac. Oc. N. of New Guinea, comprise 40 sm. is.; Australian mandate; coconuts, copra; a. 663 sq. m.; p. *13,134*.
Adonara, *I.*, one of Nusa Tenggara Is., Indonesia; p. (estd.) *25,000*.
Adoni, *t.*, Andhra Pradesh, India; cotton market; p. (1961) *69,951*.
Adour, *R.*, S.W. France; rises in Pyrenees, enters Bay of Biscay below Bayonne; length 207 m.
Adowa, *t.*, *cap.*, Tigre prov., N. Ethiopia; alt. over 6000 ft., tr. and mkt. centre; p. *c. 10,000*.
Adra, *spt.*, *t.*, Almeria, S. Spain; nr. Guardia Viejas salt beds and Berja lead-mines; sugar-cane, fish, fruit and veg. canning; p. (1957) *13,687*.
Adrano, *t.*, Sicily, Italy; at S.W. foot of Etna; agr. mkt.; p. *c. 29,000*.
Adrar *oasis*, Sahara Desert, Algeria; salt, dates, grain; p. (1960) *44,116*.
Adria, *mkt. t.*, Rovigo, Italy; formerly on cst., now 14 m. inland, old Etruscan c.
Adrian, c., Michigan, U.S.A.; 73 m. W. of Detroit; p. (1960) *20,347*.
Adrianople, *see* **Edirne.**
Adriatic Sea, branch of the Mediterranean, between Italy and Balkan Peninsula; forms G. of Venice on the N.; chief trading pts., Venice, Trieste, and Ancona on the N., Brindisi and Dürres on the S.; a. 52,000 sq. m., length 450 m.
Adullam or Aidelma, *former dist.*, Palestine; S.E. Jerusalem. Site of Canaanite city; cave, David's hiding-place from King Saul.
Adwick le Street, *urb. dist.*, W.R. Yorks, Eng.; coal; p. (1961) *18,212*.
Adzhar, *rep.*, Georgian S.S.R.; tea, citrus fruits, oil-refining, engin.; ch. t. Batumi; a. 1,100 sq. m.; p. (1959) *242,000*.
Aegades, group of rocky Is. off W. coast of Sicily; ch. t. Favignana on I. of that name.
Aegean Is., between Greece and Turkey; called the Grecian Archipelago, inc. Crete, Cyclades, Sporades, and Dodecanese; a. 1,506 sq. m.; p. (1961) *477,476*.
Aegean Sea, branch of the Mediterranean; studded with Is., between Greece and Turkey; connected through the Dardanelles with Sea of Marmara and thence through the Bosphorus Strait with the Black Sea. [fisheries.
Aegina, *I.*, Greece; in G. of same name, sponge
Aero, *I.* in the Baltic off Denmark; p. (1960) *10,109*.
Aetolia and Acarnania, *prov.*, N. Greece; cap. Missolonghi; p. (1961) *237,738*
Afam, S. Nigeria; oilfield; pipe-line E. to Pt. Harcourt.
Afars and Issas, French Territory of the, N.E. Africa, formerly French Somaliland (renamed 1967); extends inland from straits of Bab-el-Mandeb; plain, mainly below 600 ft.; hot, dry climate; shark and mother of pearl fisheries; salt, coffee, hides, oilseed; cap. Djibouti; a. 8,900 sq. m.; p. (estd. 1965) *81,000*.
Affric, Glen, Inverness, Scot.; 30 m. S.W. of Inverness; hydro-elec. scheme, opened 1952.
Afghanistan, *mtn. cty.*, Asia; monarchy; cap. Kabul; comm. ctrs. Kabul, Kandahar; ch. rs., Kabul and Helm; climate, intense summer heat, severe winter cold, scanty rainfall; races, Afghans, aboriginal hill-tribes; languages, official Persian, spoken Pushtu; religion, Islam; cereals, fruit, sheep, horses, camels; inds. carpets, woollens, silks; coal-mining at Dara-i-Suf; natural gas at Shibarghan; rich copper, lead, iron resources undeveloped; a. 250,000 sq. m.; p. (est. 1964) *15,277,000*.
Afragola, *t.*, Napoli prov., S. Italy; 5 m. N.E. of Naples; cereals, fruit, hemp; p. (1961) *45,881*.
Africa, second largest *continent*; bounded on N. by Mediterranean, by Red Sea and Indian Ocean on E., by Atlantic Ocean on W.; adjoins Asia at Isthmus of Suez. Deserts in N., forests in centre, and lofty plateaux and veldts in S. Highest mtn., Kilimanjaro, 19,324 ft.; chief rivers, Nile, Congo, Niger, Zambesi; largest L. Victoria. Great Rift Valley (K69) in E. Africa. Rainfall heavy near equator, almost rainless in Sahara and Kalahari, elsewhere moderate. Agriculture: wine, olives, wheat, esparto grass in N.; cocoa, oil palm, groundnuts, coffee, cotton in centre; wheat maize, wool in S. Minerals: gold, diamonds, copper. Compared with only 4 at end of last war, 40 countries had achieved independence by 1968. Those still to become fully indep. are: the Spanish cols. of Sp. Guinea, Sp. Sahara, Ifni; the Portuguese cols. of Angola, Port. Guinea, Mozambique; Afars and Issas (French Terr.); and Rhodesia, and S.W. Africa; a. (approx.) 11,500,000 sq. m.; p. (estd.) *225,000,000*.
Afyon Karahisar *t.*, Turkey; opium; p. (1960) *38,392*.
Agadir, *spt.*, S. cst. Morocco; wrecked by earthquake, 1960; new t. built S. of former c. in a. of greater geological stability; p. (estd. 1965) *30,000*.
Agawam, *t.*, Mass., U.S.A.; engin.; p. (1960) *15,711*.
Agder, E. and W., *two dists.*, Norway; (E.) a. 3,607 sq. m.; p. (1963) *77,639* (W.) a. 2,794 sq. m.; p. (1963) *112,012*
Agen, *t.*, *cap.* Lot-et-Garonne, France; 85 m. from Bordeaux; cath.; p. (1954) *32,593*.
Agincourt, *vil.*, Pas-de-Calais, France; famed for battle in 1415 between English, led by Henry V, and French under d'Albert.

Antisana, *volcano*, Central Ecuador, S. America.

Antofagasta, *prov.*, Chile; exp. nitrates, copper; a. 47,502 sq. m.; p. (1960) *240,537.*

Antofagasta, *spt.*, Chile; cap. of prov.; nitrates, copper, lt. inds.; p. (1960) *91,400.*

Antony, *t.*, Hauts-de-Seine, France; brick wks., toys; p. (1962) *46,823.*

Antrim, *co.*, extreme N.E. of N. Ireland; co. t. Belfast; famous Giant's Causeway is on the N. coast; a. 1,098 sq. m.; p. (1961) *273,923.*

Antrim, *t.*, N. Ireland; on Six-Mile Water; linen, nylon; p. (1961) *1,448.*

Antsirabé, *t.*, Malagasy; thermal springs; p. (1957), 18,460.

Antung (Andong), *c.*, Liaoning, China; on R. Yalu, 15 m. from mouth; Chinese frontier sta. main rly. from China into N. Korea; mkt. for agr. produce; lumbering; p. (1953) *360,000.*

Antwerp, *spt.*, Belgium; on R. Scheldt; famous Gothic cath.; Franz Hals born here in 1580, and Vandyck in 1599; great petroleum port; shipbldg., textiles, tobacco, distilling, diamond cutting, chemicals; p. (1962) *251,419.*

Antwerp, *prov.*, Belgium; grain, flax; a. 1,104 sq. m.; p. (1962) *1,455,644.*

Anyang, *c.*, Honan prov., China; coal, cotton ind.; p. (1953) *125,000.*

Anzhero-Sudzhensk, *t.*, W. Siberia, U.S.S.R.; nr. Tomsk; coal-mng., mng. equipment, pharmaceutics; p. (1959) *116,000.*

Anzin, *t.*, Nord, France; chief coal-mining centre of France; p. (1954) *15,658.*

Aomori, *spt.* Honshu, Japan; on bay of same name; salmon; chemicals; p. (1965) *224,433.*

Aosta, *t.*, *cap.*, Val d'Aosta, N. Italy; in valley of Dora Baltea at node of trans-Alpine routes; iron inds.; Mont Blanc road tunnel links to Martigny, Switzerland, opened 19 Mar. 64; p. (1951) *24,181.*

Apalachee Bay, Fla., U.S.A.; receives Apalachee R.

Apapa, *spt.*, sub. of Lagos, Nigeria; on mainland opposite I. on which Lagos is situated; modern pt. equipment, terminus of W. Nigerian rly. system; rly. wkshps.; exp. palm oil and kernels, hides and skins, ground-nuts, cocoa, rubber; imports cotton piece goods, machin.

Apeldoorn, *c.*, Gelderland, Netherlands; favourite holiday resort; precision instruments, metalware; p. (1967) *116,548.*

Apennines, mtn. "backbone" of Italy; length 800 m., width 70–80 m.; highest part is in Gran Sasso, *q.v.*

Apia, *spt.*, Upolu, W. Samoa; p. *c. 10,000.*

Apiskigamish, *L.*, Labrador, Canada.

Apolda, *t.*, Erfurt, E. Germany; textiles, engin. chemicals; p. (1963) *29,313.*

Appalachian Mtns., parallel ranges between At. and Mississippi, stretching from Maine to Alabama. Highest peak, Mt. Mitchell, 6,684 ft.

Appenzell, *can.*, N.E. Switzerland; divided into the half-cantons, Appenzell Inner-Rhoden, a. 67 sq. m., cap. Appenzell; p. (1961) *12,943*; and Appenzell Ausser-Rhoden, a. 94 sq. m. cap. Herisau; p. (1961) *48,920.*

Appenzell, *t.*, *cap.*, Appenzell, Switzerland; on R. Sitter; linen tr.; p. (1957) *5,001.*

Appleby, *mun. bor.*, *mkt. t.*, Westmorland, Eng.; on R. Eden; cas.; p. (1961) *1,751.*

Appleton, *c.*, Wis., U.S.A.; paper; p. (1960) *48,411.*

Appomattox, *R.*, Va. U.S.A.; joins James R.

Apsheron, *peninsula* on W. side of the Caspian; petroleum wells (nr. Baku) and mud volcanoes.

Apulia, *S.E. region*, Italy; pastoral plain; grain, fruits, livestock; wine, oil; a. 7,470 sq. m.; p. (1951) *3,214,854.*

Apurimac, *dep.*, Peru, S. America; ch. t. Abancay; a. 8,187 sq. m.; sugar; p. (1961) *275,910.*

Apurimac, *R.*, Peru; joins the Ucayali; l. 500 m.

Aqaba (Akaba), *pt.*, Jordan; loading of phosphates and discharging of oil; p. (1961) *9,228.*

Aqaba, *G.*, between Sinai Peninsula and Saudi Arabia. N.E. arm of the Red Sea.

Aquila degli Abruzzi, *t.*, *cap.*, Abruzzi prov., Italy; on R. terrace of R. Aterno; mkt. and sm. inds. associated with local farming; holiday resort; cath.; p. (1961) *56,314.*

Aquitaine, Basin of, *geographical region*, S.W. France; to W. and S.W. of Central Massif, to N of Pyrenees, bordered on W. by Atl. Oc.; warm, wet, oceanic climate; rich agric. lowland; inc. Landes, reclaimed sandy area; ch. ts. Bordeaux, Toulouse.

Arabia, S.W. peninsula of Asia; mainly desert plateau; coffee, dates, gums, horses, camels; petroleum; divided between Saudi Arabia, Yemen, Southern Yemen, Muscat and Oman, Trucial States, Kuwait, Bahrain, and Qatar; a. *c.* 1,000,000 sq. m.; p. *c. 8,000,000.*

Arabian Desert, U.A.R., N.E. Africa; between R. Nile and Red Sea; alt. approx. 1,200–6,000 ft.; a. *c.* 80,000 sq. m.

Arabian Sea, N.W. part of Indian Ocean, between Horn of Africa and India.

Aracajú, *spt. cap.* Sergipe st., Brazil; sugar, soap, textiles, tanneries; p. (1960) *115,713.*

Arad, *t.*, Israel; in Negev desert, E. of Beersheba; new t. inaugurated 21 Nov. 1962; ind. to be based on gasfields at Zohar and Kanaim; chemicals, fertilisers.

Arad, *t.*, Romania; on R. Maros. wine, corn, tobacco, textiles; p. (1963) *124,642.*

Arafura Sea, N. of Australia, S.W. of Papua, and E. of Timor.

Aragon, *old prov.*, Spain; forests, coal, iron.

Araguaia, *R.*, Brazil; trib. of Tocatins; length 1,000 m.

Araish (Laraish, Larache), *spt.*, Morocco, N. Africa; on Atlantic cst., 45 m. S.W. of Tangier; tr. in grain and fruit, cork; p. (1960) *30,763.*

Arak, *t.*, Iran; carpets; p. (1956) *58,929.*

Aral Sea, large salt *L.*, Kazakhstan Rep. (U.S.S.R.); a. 26,166 sq. m.; receiving the Amu and Syr Darya Rs.; no outlet.

Aran, *Is.* group in Galway Bay, Ireland; fishing.

Aranjuez, *t.*, Spain; on R. Tagus; mkt. gardens; strawberries, asparagus; p. (1957) *24,667.*

Ararat, *mtn.*, Turkey; supposed resting-place of Noah's Ark.

Ararat, *t.*, Victoria, Australia; on Hopteins R., 131 m. from Melbourne; p. (1961) *7,930.*

Aras R. (the ancient Araxes), rising in Armenia, flows through Transcaucasia to the Kur, 500 m.

Arauan, *trading t.*, Sahara desert, N. Timbuktu,

Arauco, *prov.*, S. Chile; a. 2,222 sq. m.; cereals, alfalfa, fruit; p. (1961) *94,079.*

Aravalli Mtns., Rajasthan, India; Mt. Abu, 5,650 ft.

Araxes R., rises in Armenia, flows through Transcaucasia to Caspian Sea; bdy. between Persia and U.S.S.R.

Arbroath, *royal burgh*, Angus cst., Scot.; engin., textiles (flax, jute, cotton, woollens), fishing; holiday resort; p. (1961) *19,533.*

Athy, *urb. dist.*, Kildare, Ireland; p. (1961) *3,842.*
Atikokan, *sm. t.*, Ontario, Canada; on Canadian National Rly., 110 m. W. of Fort William; ctr. of Steep Rock iron-ore mines.
Atiquizaya, *t.*, Ahuachapán, Salvador, Central America; p. *5,901.*
Atlanta, *cap. largest c.*, Georgia, U.S.A.; univ.; cotton, paper, farm implements, printing, clothing; p. (1960) *487,455.*
Atlantic City, *summer resort*, N.J., U.S.A.; p. (1960) *59,544.*
Atlantic Ocean, 2nd lgst ocean; a. (estd.) 31,830,000 sq. m.; conn. to Pac. Oc. by Panama Canal. Central ridge of volcanic activity runs S. from Iceland to Antarctic, some peaks emerging as Is. (*e.g.*, Azores, Ascension, Tristan da Cunha). Chief deeps: Milwaukee Deep (30,246 ft.) near Bahamas and Nares Deep (27,972 ft.) near Puerto Rico.
Atlántico, *dep.*, Colombia, S. America; cap. Barranquilla; a. 1,340 sq. m.; p. (estd. 1961) *612,170.*
Atlas, *great mtn. range*, N.W. Africa; extending 1,500 m. through Morocco and Algeria to Tunis. Highest point, Tizi-n-Tamjurt, 14,500 ft.
Atlit (Athlit), *t.*, Israel; S. of Haifa; site of Crusaders' pt.
Atmore, *t.*, Ala., U.S.A.; 35 m. N.E. of Mobile Bay; p. (1960) *8,173.*
Atoka, *t.*, Okla., U.S.A.; flour, lumber mills; p. (1960) *2,877.*
Atrato, *R.*, Colombia, S. America; flowing to G. of Darien, length 275 m.
Atrauli, *t.*, Uttar Pradesh, India; 16 m. from Aligarh; p. (1961) *17,936.*
Atrek, *R.*, Iran; enters Caspian Sea; length 250 m.
Atshan, *t.*, Fezzan, Libya, N. Africa; oil.
Attica, *dep.*, Greece; olives, grapes, figs; a. 1452 sq. m.; p. (1961) *2,057,994.*
Attica, *t.*, New York, U.S.A.; p. (1960) *2,758.*
Attleboro, *c.*, Bristol, S.E. Mass., U.S.A.; p. (1960) *27,118.*
Attock, *t.*, Pakistan; between Peshawar and Islamabad; oil wells.
Atzcapotzalco, *t.*, Fed. Dist., Mexico; oil ref.; petro-chemicals.
Aubagne, *t.*, Bouches-du-Rhône, France; bricks, tiles, corks, meat processing; p. (1962) *21,889.*
Aube, *dep.*, N.E. France; cereals, fruit, livestock; cap. Troyes; a. 2,326 sq. m.; p. (1962) *255,099.*
Aube, *R.* France; trib. Seine; length 1,255 m.
Aubervilliers, *t.*, Seine, France; industl.; p. (1962) *70,836.*
Aubrac, *mtns.*, Auvergne, France.
Auburn, *t.*, Ind., U.S.A.; comm. ctr. for agr. area; light engin.; p. (1960) *6,350.*
Auburn, *c.*, Maine, U.S.A.; footwear; p. (1960) *24,449.*
Auburn, *t.*, N.Y., U.S.A.; shoes, woollens, farm implements; p. (1960) *35,249.*
Auch, *t.*, *cap.*, Gers, France; cottons, woollens poultry, wines; p. (1962) *20,384.*
Auchel, *t.*, Pas de Calais, France; coal; p. (1954) *14,825.*
Auchinleck, *par.*, Ayr., Scot.; coal; p. (1951) *6,808.*
Auchterarder, *burgh*, Scot.; 15 m. S.W. of Perth; health resort S. slopes of the vale of Strathearn; woollen inds.; p. (1961) *2,426.*
Auchterderran, *par.*, Fife., Scot.; coal; p. (1951) *17,599.*
Auchtermuchty, *burgh*, Fife., Scot.; at S. foot of Ochil Hills, 25 m. N.E. of Alloa; distilling, cotton spinning; p. (1961) *1,354.*
Auckland, *prov.*, N.I., New Zealand; farming, gold, Kauri gum, coal; a. 25,400 sq. m.; p. (1961) *996,281.*
Auckland, *spt.*, *c.*, N.I., New Zealand; lgst. *c.* in N.Z.; seat of government 1845–64; extensive tr. and shipping; univ.; sawmills, sugar refinery, shipbldg., glass; steelwks projected 25 m. S. of A., in Waikato iron sand a.; p. (1964) *499,700* of c. *147,900.*
Auckland Is., uninhabited group in Southern Ocean; 200 m. off New Zealand, discovered by British in 1806.
Aude, *maritime dep.*, S.E. France; grain, fruit, wine; slate, iron; cap. Carcassonne; a. 2,448 sq. m.; p. (1962) *269,782.*
Audenshaw, *urb. dist.*, Lancs., Eng.; metals, leather, pharmaceutics; p. (1961) *12,112.*
Audincourt, *t.*, Doubs, France; forges, automobile and textile plants; p. (1962) *12,527.*
Audubon, *t.*, W. Iowa, U.S.A.; canneries; p. (1960) *2,928.*
Aue, *t.*, Karl-Marx-Stadt, E. Germany; nr. Zwickau; uranium-mining, metallurgy, textiles; p. (1963) *31,740.*
Auerbach, *t.*, Karl-Marx-Stadt, E. Germany; textiles; p. (1963) *19,082.*
Augsburg, *c.*, Bavaria, Germany; at confluence of Rs. Lech and Wertach; cath; theological institute; textiles, aircraft and diesel engines; route ctr.; p. (1963) *210,500.*
Augusta, *t.*, Sicily, Italy; on sm. I. connected to E. cst.; good harbour used as naval base; fishing; lubricants; p. *25,437.*
Augusta, *spt.*, S.W. coast, W. Australia.
Augusta, *t.*, *cap.*, Me., U.S.A.; on Kennebec R.; footwear, cotton goods, paper; p. (1960) *21,680.*
Augusta, *c.*, Ga., U.S.A.; on Savannah R.; cotton, cotton-seed oil, chemicals, foundries; p. (1960) *70,626.*
Augustow, *t.*, Poland; on Suwalki canal.

Aulnay-sous-Bois, *t.*, Siene-St-Denis, France; p. (1962) *47,686*.

Aunjetitz, *t.*, CSSR.; site of early Bronze Age culture.

Aurangabad, *t.*, Maharashtra, India; textiles; p. (1961) *87,579*.

Auray, or Alrac, *t.*, Morbihan, Brittany, France; oysters, dairy produce; p. (1962) *8,354*.

Aurès, *mtn. massif* Algeria, N. Africa; Berber stronghold.

Aurignac, *commune*, Haute-Garonne, France; caves, paleolithic remains; tanneries.

Aurillac, *t.*, *cap.*, Cantal, France; industl.; p. (1962) *27,056*.

Aurora, *t.*, Col., U.S.A.; residtl. sub. 5 m. E. of Denver; p. (1960) *48,548*.

Aurora, *t.*, E. Ind., U.S.A.; lumber, mnfs. coffins, furniture; p. (1960) *4,119*.

Aurora, *rly. c.* Ill., U.S.A.; textiles, foundries; p. (1960) *63,715*. [*4,683*

Aurora, *t.*, Mo., U.S.A.; mining region; p. (1960)

Au Sable, *R.*, New York, U.S.A.; flows from the Adirondack Mtns. to L. Champlain.

Au Sable, *R.*, Mich., U.S.A., emptying into L. Huron.

Aussig, *see* **Usti**.

Austin, *t.*, Minn., U.S.A.; food prods.; p. (1960) *27,908*.

Austin, *c.*, *cap.*, Texas, U.S.A.; on R. Colorado; st. univ.; farming ctr.; bricks, furniture; p. (1960) *186,545*.

Austral and Rapa Is., French group in Pacific Ocean; largest I. Rurutu; a. 115 sq. m.; p. (1962) *4,371*.

Australasia, div. of Oceania including Australia, Tasmania, New Zealand, New Guinea and neighbouring archipelagos.

Australia, Commonwealth of, largest I. in world; Cook took possession for Britain 1770; Commonwealth proclaimed 1901, federation of N.S.W., Victoria, Queensland, S. Australia, W. Australia and Tasmania; includes also federal cap. terr., N. Territory; cap. Canberra (administered separately). Mtns. in E.; most salient feature great interior plains, mainly arid; chief rivers: Murray, Darling, Swan; saline lakes. Climate: interior extremely hot and dry, cst. more moderate, N. coast tropical. Agr.: wheat, hay, cane-sugar, fruit; sheep, cattle, dairying; timber; great mineral resources: iron, bauxite, tin, gold, lead, silver, copper, zinc, coal; a. 2,974,581 sq. m.; p. (1964) *11,250,708*.

Australia, South, *st.* of the Australian Commonwealth, the "Desert State"; mainly undulating, interior forms part of central plateau of continent, mtns. in S. and S.E., 3,000 ft.; wheat crops, stock-raising, dairying, fruit, olives; lead, iron, uranium; exp. corn, wool, mutton; cap. Adelaide; a. 380,070 sq. m.; p. (1964) *1,044,662*.

Australia, Western, *st.* of the Australian Commonwealth, and the largest, occupying nearly a third of western part of continent; cap. Perth, on the Swan R.; wool, fruit, wheat, frozen meat; gold, bauxite, coal, high grade iron-ore, asbestos and ilmenite deposits; Kununurra Dam irrigation scheme for semi-arid northern regions; a. 975,920 sq. m.; p. (1964) *789,626*.

Australian Alps, *see* **Alps, Australian**.

Australian Antarctic territory, part of Antarctica; between 45° E. and 160° E.; inc. Oates Land, King George V Land, Wilkes Land, Queen Mary Land, Kaiser Wilhelm II Land, Princess Elizabeth Land, MacRobertson Land, Kemp Land, Enderby Land, MacDonald Is., together with the research stas. of Mawson, Davis, and Wilkes; a. (estd.) 2,472,000 sq. m.

Australian Bight, Great, large indentation on Australian S. coast between C. Catastrophe and C. Arid (850 m.)

Australian Capital Territory, area surrounding Canberra, seat of Fed. Govt. of Australia; predominantly pastoral; a. 939 sq. m.; p. (1964) *84,686*.

Austria, *rep.*, Europe; in 1938 forcibly incorporated in German Reich, liberated in 1945, and recovered its sovereignty and indep. 1955; mountainous, forested, drained by R. Danube; agr.; tourism; lignite, anthracite, iron, textiles, pianos, brewing; cap. Vienna; a. 32,393 sq. m.; p. (1961) *7,073,807*.

Austria, Lower, *st.*, Austria; cap Vienna; a. (excluding Vienna) 7,098 sq. m.; p. (excluding Vienna) (1961) *1,374,012*.

Austria, Upper, *st.*, Austria; cap. Linz; a. 4,625 sq. m.; p. (1961) *1,131,623*.

Autlán de Navarro, *t.*, Mexico; S.W. Jalisco state; p. *10,915*.

Autun, *c.*, Saône-et-Loire, France; anc. Augustodunum; Roman remains; oil-shale refinery, leather, furniture, dyes, fertilisers; p. (1962) *17,165*.

Auvergne, old French prov. forming the present deps. of Puy-de-Dôme, Cantal and a small part of Haute-Loire.

Auvergne Mtns., *mtns.*, Central France; in N.W. of Central Plateau; highest peak, Mt. Dore, 6,188 ft.

Aux Cayes, *spt.*, Rep. of Haiti, W. Indies; on S. cst.; p. *25,000*.

Auxerre, *industl. c.*, *cap.*, Yonne, France; cath.; vines, bricks, iron and steel; p. (1962) *32,961*.

Bellefontaine, *t.*, Ohio, U.S.A.; agr. ctr., light mnfs.; holiday resort; p. (1960) *11,424*.

Bellefonte, *bor.*, Penns., U.S.A.; limestone quarries; p. (1960) *6,088*.

Belle Fourche, *t.*, S.D., U.S.A.; on Belle Fourche R.; beet sugar, flour, bricks, dairy produce; p. (1960) *4,087*.

Bellegarde, *fort* on frontier of France and Switzerland, near Geneva.

Belle Ile, *I.* off S. coast of Brittany, France.

Belle Isle Strait, N. America; between Newfoundland and Labrador, on N. shipping route to Canada from Europe.

Bellenden Ker Hills, *mtn. range*, N. Queensland, Australia.

Belleville, *c.*, Ontario, Canada; dairying, fruit; deposit of white marble nearby; p. (1961) *30,655*.

Belleville, *t.*, Ill., U.S.A.; brewing, iron founding, shoes, flour; p. (1960) *37,264*.

Belleville, *t.*, N.J., U.S.A.; p. (1960) *35,005*.

Bellevue, *t.*, Ohio, U.S.A.; limestone, farm implements, car parts; p. (1960) *8,282*.

Bellevue, *t.*, Penns., U.S.A.; p. (1960) *11,412*.

Bellevue, *t.*, Queensland, Australia; goldfields.

Belley, *t.*, Ain, France; p. (1954) *5,470*.

Bellflower, *t.*, Cal., U.S.A.; p. (1960) *44,846*.

Bellingham, *rural dist.*, Hexham, Northumberland, Eng.; coal; p. (1961) *5,285*.

Bellingham, *t.*, *spt.*, Wash., U.S.A.; saw-mills, paper-mills, salmon canning; p. (1960) *34,688*.

Bellingshausen, *sea*, S. Antarctic; lying W. of Graham Land.

Bellinzona, *t.*, Switzerland; on R. Ticino; 14 m. N. of Lugano; three castles built on hills dominating t.; p. (1957) *12,060*.

Bellot Strait, channel on Arctic coast, N. America; separates Boothia and N. Somerset.

Bellows Falls, *t.*, Vt., U.S.A., on Connecticut, R. paper, farm implements; p. (1960) *3,831*.

Belluno, *c.*, Venetia, N. Italy; fine cath.: silk p. (1961) *31,224*.

Belluno, *prov.*, Venetia, N. Italy; a. 1,276 sq. m.; p. (1961) *205,700*.

Belmar, *t.*, N.J., U.S.A.; seaside resort, fishing; p. (1960) *5,190*.

Belmez, *t.*, Córdoba prov., S. Spain; on N. flank of Sierra Morena, 38 m. N.W. of Córdoba; ctr. of sm. coalfield; p. (1959) *9,672*.

Belmont, *t.*, Cape Province, S. Africa; 56 m. S. of Kimberley.

Belmont, *t.*, Mass., U.S.A.; p. (1960) *28,715*.

Belmont, *t.*, N.C., U.S.A.; p. (1960) *5,007*.

Belo Horizonte, *t.*, *cap.*, Minas Gerais st., Brazil; gold, iron, manganese; diamond-cutting; ctr. of agr. inds.; cotton; p. (1960) *693,328*.

Beloit, *c.*, Wisconsin, U.S.A.; on Rock R., diesel engines, farm implements; p. (1960) *32,846*.

Beloit, *c.*, Kan., U.S.A.; on Solomon R.; tr. ctr. for agr. region; p. (1960) *3,837*.

Beloretsk, *t.*, Bashkir A.S.S.R.; iron, metal inds.; p. (1959) *59,000*.

Belovo, *t.*, W. Siberia, R.S.F.S.R.: coal mng., zinc, engin.; p. (1959) *107,000*.

Beloyarsk, R.S.F.S.R.; atomic power sta. in Urals.

Belper, *urb. dist.*, Derby, Eng.; hosiery, textiles, paint, oil wks., iron foundries; p. (1961) *15,563*.

Belt, Great, *strait*, Denmark; separates Fyn I. from Själland I.; deep-water channel too winding for easy navigation; crossed by train ferry at its narrowest point (16 m.) between Nyborg and Korsor; approx. length 37 m.

Belt, Little, *strait*, Denmark; separates Fyn I. from Jutland; too shallow for large ships; bridged by road-railway bridge nr. Fredericia; approx. length 30 m.

Belterra, *dist.*, Para st., N.E. Brazil; on R. Tapajoz, 30 m. S. of confluence with R. Amazon at Santarem; experimental Ford rubber plantations; a. 950 sq. m.; p. (with Fordlandia) *12,000*.

Beltsy, *t.*, Moldavian S.S.R.; on trib. of Dniester R.; p. (1959) *67,000*.

Belturbet, *t.*, *urb. dist.*, Cavan, Ireland; on R. Erne; distilling; p. (1951) *1,152*.

Bembridge, *vil.*, I. of Wight, Eng.; resort, yachting; p. *1,975* (par.).

Bemfica, Angola, W. Africa; oilfields.

Bemidji, *t.*, Minn., U.S.A.; lumber, cement, bricks, woollen goods; resort; p. (1960) *9,958*.

Ben Alder, *mtn.*, Grampian Range, Scot.; nr. Loch Erich; alt. 3,757 ft.

Ben Arthur, *mtn.*, Argyll, Scot.; alt. 2,891 ft.

Ben Attow, *mtn.*, Ross and Inverness, Scot.; alt. 3,383 ft.

Ben Avon, *mtn.*, Aberdeen, Scot.; alt. 3,834 ft.

Ben Cruachan, *mtn.*, Argyll, Scot.; alt. 3,689 ft.

Ben Doran or **Doireann**, *mtn.*, Argyll, Scot.; alt. 3,523 ft.

Ben Hope, *mtn.*, Sutherland, Scot.; alt. 3,040 ft.

Ben Lawers, *mtn.*, Perth, Scot.; by Loch Tay; alt. 3,984 ft.

Ben Ledi, *mtn.*, Perth, Scot.; N.W. of Callander; alt. 2,875 ft.

Ben Lomond, *mtn.*, Stirling, Scot.; E. side of L. Lomond; alt. 3,192 ft.

Ben Lomond, *mtn.*, New England range, N.S.W., Australia; alt. 5,000 ft.

Ben Lomond, *mtn.*, Tasmania, Australia; alt. 5,010 ft.

Ben Macdhui, *mtn.*, S.W. Aberdeen, Scot.; Cairngorm gr; second highest peak in Brit. Is.; alt. 4,296 ft.

Ben More, *mtn.*, S.W. Perth, Scot.; 10 m. W. of Loch Earn; alt. 3,843 ft.; also mtns. in Sutherland, the Hebrides and the I. of Mull.

Ben Nevis, *mtn.*, Inverness, Scot.; at Lochiel; highest peak in Brit. Isles, alt. 4,406 ft.

Ben Nevis, *mtn.*, Otago, New Zealand; alt. 9,125 ft.

Ben Nevis, *mtn.*, Cornwall, Tasmania, Australia; alt. 3,910 ft.

Ben Venue, *mtn.*, nr. Loch Katrine, Perth, Scot.; alt. 2,393 ft.

Ben Vorlich, *mtn.*, Perth, Scot.; alt. 3,224 ft.

Ben Wyvis, *mtn.*, Ross, Scot.; nr. Dingwall; alt. 3,429 ft.

Benalla, *t.*, *dist.*, Victoria, Australia; pastoral and agr.; p. (1961) *8,483*.

Benares, *see* **Varanasi**.

Benbecula I., Outer Hebrides, Inverness, Scot.; a. 36 sq. m.

Benbecula Sound, passage between the I. and S. Uist.
Bendery, *t.*, Moldavian S.S.R.; textiles, p. (estd. 1961) *63,000*.
Bendigo, *c.*, Victoria, Australia; gold-mining dist., rich farming and wine-producing terr.; p. (1961) *40,309*.
Benevento, *prov.*, Italy; a. 819 sq. m., containing many Roman remains; p. (1961) *297,153*.
Benevento, *c.*, Italy; cath.; leather; p. (1961) *54,744*.
Benfleet, *urb. dist.*, Essex, Eng.; saw mills, joinery wks., light inds.; p. (1961) *32,395*.
Bengal, West, *st.*, India; a. 33.928 sq. m.; p. (1961) *34,926,279*; rice, oilseeds, sugar cane, tobacco, jute, silk, tea, coal, mesta, potatoes; served by 3 st. rlys.; Ganges alluvial plains and delta; ch. c. Calcutta which adjoins jute manuf. ctr. Howrah. (Former prov. of Bengal split 1947—W. Bengal to India, E. Bengal to Pakistan).
Bengal, Bay of, part of Indian Ocean washing E. shores of India and W. shores of the Indo-Chinese Peninsula; receives waters of Rs. Krishna, Ganges, Brahmaputra, Irrawaddy.
Benghazi, *spt.*, Libya, N. Africa; on the G. of Sidra; joint cap. with Tripoli; former starting-point for caravans to Egypt and the interior; cereals; p. (estd. 1954) *71,000*.
Bengore Head, *C.*, Antrim, N. coast Ireland; E. of Giant's Causeway.
Benguela, *c.*, Angola, S.W. Africa; rly. runs inland to Congo and Zambia; beeswax, maize, cattle, sugar; p. (1960) *52,300* inc. *11,500* whites.
Benha, *t.*, U.A.R.; impt. mkt. t., rail and road ctr. in heart of cultivated a. of Nile delta.
Benholm, *par.*, Kincardine, Scot.; ancient cas.; p. (1951) *1,028*.
Beni, *dep.*, N.E. Bolivia, S. America; cap. Trinidad; a. 93,354 sq. m.; p. (1962) *161,800*.
Benicarlo, *spt.*, Valencia, Spain; on Mediterranean cst.; wines; p. (1957) *9,385*.
Benin, W. Africa; between Niger delta and Dahomey; traversed by Benin R.; former African kingdom and slaving ctr., now dist. incorporated in Nigeria; palm prod. and foodstuffs; famous African bronze ctr.; ch. t. Benin.
Benin, *t.*, Nigeria; W. Africa; cap. Mid-West region; palm oil, mahogany; p. (1953) *54,000*.
Benin, Bight of, part of G. of Guinea, W. Africa.
Beni Suef, *t.*, U.A.R.; on Nile, 60 m. S. of Cairo; carpets, cotton; p. (1960) *79,000*.
Benkulen, *spt.*, Sumatra, Indonesia; p. *13,418*.
Benmore, *C.*, Antrim, N.E. point of N. Ireland; alt. 636 ft.
Bennettsville, *t.*, S.C., U.S.A.; yarn, tyre linings, lumber; p. (1960) *6,963*.
Bennington, *t.*, Vt., U.S.A.; p. (1960) *8,023*.
Benoni, *t.*, Transvaal, S. Africa; engin.; p. (1960) *135,467* (inc. *41,305* whites).
Benrath, *t.*, Germany; on Rhine R.; R. pt. and industl. t.; chemicals, machin.; p. *25,929*.
Bensberg, *t.*, N. Rhine-Westphalia, Germany; 10 m. from Cologne; iron-mining, foundries; p. (1963) *33,400*.
Bensheim, *t.*, Hessen, Germany; ctr. of fruit and wine dist.; textiles, paper, metallurgy; p. (1963) *24,800*.

Camerino, *c.*, Macerata, Central Italy, in Apennines; the ancient Camerium annexed to Papal States in 16th century; univ. cath.

Cameron, *c.*, Texas, U.S.A.; p. (1960) *5,640*.

Cameron Bay, *t.*, N.W. Terr., Canada; by Gr. Bear Lake; radium.

Cameroons, British (North and South), former U.N. trust terrs. under British adm. (Northern part achieved independence as part of Nigeria (Sardauna prov.), and Southern part as part of Cameroun (Western prov.) (1961); a. 34,081 sq. m.; p. (estd 1960) *1,621,000*.

Cameroun, **Fed. Rep. of**, *ind. sovereign st.* (Jan. 1960); comprises Eastern Cameroun (former U.N. trust terr. under French adm.) and Western Cameroun (former U.N. trust terr. under British adm.). Fed. cap. Yaoundé; timber, cocoa, palm kernels, palm oil, groundnuts, bananas, coffee; a. 143,500 sq. m.; p. (estd 1965) *5,150,000*.

Camiguin, *I.*, Philippines; in Mindanao Sea mtns.; sugar, rice, tobacco; a. 96 sq. m.

Campagna, Italy; malarial coastal plain round Rome; now being drained; new commune of Latina founded 1932.

Campanha, *t.*, Minas Geraes, Brazil; industl.

Campania, *region*, S. Italy; ch. t. Naples; a. 5,250 sq. m.; p. (1961) *4,756,094*.

Campaspe, *R.*, Victoria, Australia; rises in Grampian Mtns., flows N. into R. Murray at Echuca; supplies water for irrigated area between Rochester and Echuca; length, 140 m.

Campbellton, *t.*, *spt.* New Brunswick, Canada lumbering, fishing; (1961) *9,873*. [*18,649*.

Campbelltown, *t.*, N.S.W., Australia; p. (1961

Campbeltown, *burgh*, *spt.*, Argyll, Scot.; on Firth of Clyde cst. of peninsula of Kintyre distilling, fishing; p. (1961) *6,525*.

Campeche, *st.*, Yucatan, Mexico; hot, flat and unhealthy; rice, cotton, logwood, chicle, sisal a. 19,670 sq. m.; p. (1960) *168,219*.

Campeche, *cap. t. of st.*, *spt.*, Mexico; on G. of Mexico; exp. logwood, sisal, hemp; p. (1960) *31,272*.

Camperdown, *t.*, Victoria, Australia; dairying dist.; p. *3,029*.

Camperdown, *vil.* on dunes, N. Holland, Netherlands; battle 1797.

Campinas, *t.*, Brazil; 55 m. N. of São Paulo; coffee; machin.; rubber gds.; p. (1960) *179,797*.

Campine or **Kempenland**, *dist.*, provs. Limburg and Antwerp, Belgium; coalfield.

Campo Belo, *t.*, Minas Geraes st., Brazil; 200 m. by rail N.E. of Guanabara; impt. cattle ctr.

Campobasso, *prov.*, Italy; in Appenines; a. 1,692 sq. m.; p. (1961) *332,121*.

Campobasso, *fortfd. t.*, 50 m. N.E. Naples, Italy; famous for cutlery and arms; p. (1961) *34,314*.

Campobello di Licata, *t.*, Sicily; sulphur-mines.

Campobello di Massara, *t.*, Sicily; quarrying.

Campos, *c.*, Rio de Janeiro, Brazil; coffee, sugar, alcohol distilling; p. (1960) *90,601*.

Campsie Fells, *range of hills*, Stirling, Scot.; highest point, 1,894 ft.

Campulung, *t.*, Muscel, Romania; N.W. of Bucharest.; summer resort; p. (1963) *22,696*.

Canada, **Dominion of**, N. America; dominion founded 1867, and now inc. all Brit. N. American Federation of ten provinces; Nova Scotia, New Brunswick, Prince Edward I., Quebec, Ontario, Manitoba, Saskatchewan, Alberta, Brit. Columbia, Newfoundland with Labrador, and the terr. of Yukon and N.W. Territories (Franklin, Keewatin, Mackenzie); cap. Ottawa; Great Lakes; Rocky Mtns.; Great Plains; St. Lawrence, Saskatchewan, and Mackenzie Rs.; Trans-Canada Highway 4860 m. long runs from St. John's (Newfoundland) to Victoria (B.C.) opened 3 Sept. 1962; extreme climate, Pacific seaboard mild; conniferous forest belt except for Central grass-lands, tundra in N.; agr.: wheat, oats, dairying; pulp, paper; coal, gold, copper, nickel, zinc, lead, radium, uranium; oil, natural gas; fisheries; furs; hydro-electric power; impt. mnfs.; a. 3,851,809 sq. m.; p. (estd. 1966) *20,014,800*.

Canada Dam, Bihar, Indian Union; on R. Mayurakshi, 160 m. from Calcutta.

Canadian Coast Range, *mtns.*, B.C., W. Canada; extend N.W. to S.E. along cst.; penetrated by deep inlets (fjords) with very little cst. plain; drained by short, swift Rs., crossed only by R. Skeena in N., R. Fraser in S., which give access to interior; marked climatic barrier, to W. equable climate with heavy all-year rain, to E. more extreme semi-arid climate, especially on valley floors.

Canadian R., trib. (flowing from New Mexico) of Arkansas R., U.S.A.; length 900 m.

Canal du Centre, *canal*, Saône-et-Loire dep., France; links Rhône–Saône valley at Chalon-sur-Saône with R. Loire at Digoin; serves Le Creusot Coalfield; length 60 m.

Canal Zone, **Panama**; strip of land leased to U.S.A. for Panama Canal; a. 648 sq. m. (276 sq. m. water); p. (1960) *42,122*.

Cananea, *t.*, Mexico; cattle, copper, silver, lead, zinc; p. *11,006*.

Cañar, *prov.*, Ecuador; cap. Azoques; Inca remains; agr., Panama hats; a. 1,521 sq. m.; p. (estd. 1962) *112,618*.

Canaries Current, *ocean current*; flows S. along N.W. cst. of Africa from Casablanca to C. Verde; relatively cold and has very marked cooling effect on Saharan coastlands.

Canary Is., or **Canaries**, N. Atl. Oc.; group of 7 Is. belonging to Spain, 60 m. off cst. Africa and 700 m. S. of Gibraltar; compr. Tenerife I., the lgst. (cap. Santa Cruz), Gran Canaria (cap. Las Palmas), Palma, Gomera, Hierro, Fuerteventura, Lanzarote; tropical produce; ch. exp., bananas, oranges, tomatoes, vegetables and tobacco; wine, cochineal; a. 4,685 sq. m.; p. (1962) *967,177*.

Canastota, *t.*, N.Y., U.S.A.; engin., furniture, plastics; p. (1960) *4,896*.

Canberra, Australian Capital Territory, Australia; in Gr. Dividing Range (alt. *c.* 6,000 ft.) 200 m. S.W. of Sydney; *seat of govt.* of Commonwealth; univ; 911 sq. m.; p. (of t. 1963) *65,000*.

Cancale, *t.*, Ille-et-Vilaine dep., N. France; St. Michael's Bay; oysters; p. (1954) *5,463*.

Candia (Herakleion), *c.*, Crete; midway along N. cst.; olive oil, raisins; p. (1961) *64,492*.

Candon, *t.*, Luzon, Philippines; p. (1948) *22,362*.

Canea, *see* Khania. [p. (1953) *201,359*.

Canelones, *dep.*, Uruguay; wine; a. 1,834 sq. m.;

Cañete, *sm. spt.*, Lima dep., Peru, S. America; 75 m. S.E. of Callao; exp. cotton grown under irrigation in Canete valley.

Cangas de Onis, *commune*, Spain; agr., cattle; coal, copper, tanning; p. (1957) *10,713*.

Cangas de Tineo, *t.*, Oviedo, Spain; nr. N. cst., 35 m. E. of Oviedo; woollens, linens; p. (1957) *21,500*.

Canicatti, *t.*, Sicily; sulphur; in fruit-growing dist.; p. *27,860*.
Canna, *sm. I.*, Hebrides, Scot.; basaltic pillars.
Cannanore, *t.*, Kerala, India; exp. timber, coconuts; p. (1961) *48,960*. [*11,601*.
Cannet (Le), *t.*, Alpes-Maritime, France; p. (1954)
Cannes, *spt.*, dep. Alpes-Maritimes, France; 20 m. S.W. Nice; famous winter resort; perfumes; p. (1962) *59,173*.

Darlaston, *urb. dist.*, Staffs, Eng.; nuts, bolts, fabricated steel mnfs., drop forgings, car components, pot and tile mkg.; p. (1961) *21,732*.

Darling, *R.*, N.S.W., Australia; rises in Gr. Dividing Range, flows S.W. into Murray R. at Wentworth; length 1,702 m.

Darling Downs, *plateau*, S.E. Queensland, Australia; grazing cty.; ch. t. Toowomba.

Darling Range, *mtns.*; granite range; gt. grazing cty. of W Australia; parallel with cst., highest peak, 3,500 ft.

Darlington, *t.*, *co. bor.*, Durham, Eng.; locomotive, wagon and bridge bldg., woollen yarn mnf.; engin.; p. (1961) *84,162*.

Darmstadt, *t.*, Hessen, Germany; on Darm R.; cas.; metallurgy, paper, machin., radio, chemicals, plastics; p. (1963) *139,600*.

Dart, *R.*, Devon, Eng.; rises in Dartmoor, flows S. into English Channel at Dartmouth; l. 46 m.

Dartford, *mkt. t.*, *mun. bor.*, Kent, Eng.; nr. S. cst. of Thames estuary 15 m. E. of London; Dartford–Purfleet road tunnel (1963); engin., chemicals, quarrying, paper; p. (1961) *45,643*.

Dartmoor, *high stony plateau*, S.W. Devon, Eng.; granite; kaolin; sheep and ponies; a. 220 sq. m.; highest point, High Willhays, 2,039 ft.

Dartmouth, *spt.*, *mun. bor.*, S. Devon, Eng.; on W of estuary of R. Dart; Royal Naval College; pottery; p. (1961) *5,757*.

Dartmouth, *t.*, Nova Scotia; p. (1961) *46,966*.

Dartmouth, *t.*, Mass., U.S.A.; p. (1960) *14,464*.

Dartmouth, *pt.*, Richmond Bay, Prince Edward I., Canada. [coal; p. (1961) *14,111*.

Darton, *urb. dist.*, W.R. York., Eng.; nr. Barnsley;

Darvel, *burgh*, Ayr, Scot.; on R. Irvine, 8 m. E. Kilmarnock; curtains, carpet; p. (1961) *3,255*.

Darwen, *t.*, *mun. bor.*, N.E. Lancs, Eng.; on flank of Rossendale Fells, 3 m. S. of Blackburn; cottons, tile and glaze brick, paint and paper, mftg.; p. (1961) *29,452*.

Darwin, *t.*, *spt.*, N. Terr., Australia; landing place of world airlines—England to Australia; p. (1961) *12,480*.

Dashava, settlement in Lvov Oblast, W. Ukraine, U.S.S.R.; ctr. of rich natural gas field and starting point of gas pipe-line to Kiev and Moscow, built after 2nd. World War.

Datia, *t.*, Madhya-Pradesh, India; stone-walled, palaces; p. (1961) *29,430*.

Datteln, *t.*, N. Rhine–Westphalia, Germany; coal, leather, iron; p. (1963) *31,200*.

Daugavpils, *t.*, Latvian S.S.R. on Dvina R.; textiles, engin., rly. repair wks.; p. (1959) *65,000*.

Daura, *t.*, nr. Baghdad, Iraq; oil refining.

Davão, *t.*, Mindanao, Philippines; p. (1960) *225,712*.

Davenport, *c.*, Iowa, U.S.A.; at foot of Rock I.; rapids; on Mississippi R.; flour mills; p. (1960) *88,981*.

Daventry, *t.*, *mun. bor.*, Northampton, England.; 9 m. S.E. of Rugby; boot-mkg., light engin.; wireless-transmission sta.; p. (1961) *5,846*.

David, *t.*, cap. Chiriqui prov., Panama; timber, coffee, cacao, sugar; p. (1960) *22,924*.

Davis Strait, *channel* between Greenland and

Baffin Land, N.W. Terr., Canada; connects Atlantic with Baffin Bay.
Davos-Platz, *Alpine winter resort*, Grisons, Switzerland: alt. 4,845 ft.; p. *9,259*.
Dawley, *t.*, *urb. dist.*, Shropshire, Eng.; on S.E. flank of The Wrekin; ironwks., pipe, cement, roadstone, asphalt and brick wks., engin.; "New Town" designated 1963; p. (estd. 1965) *21,500*.
Dawlish, *t.*, *urb. dist.*, S. Devon, Eng.; on S. cst. between estuaries of Rs. Exe and Teign; seaside resort; p. (1961) *7,807*.
Dawson, *t.*, Yukon Terr., Canada; on Yukon R., nr. the Klondyke goldfields; asbestos mng. projected 1968; p. (1961) *846*.
Dax, *t.*, Landes, S.W. France; on Adour R.; hot sulphur spring; horse mart; p. (1954) *14,557*.
Daylesford, *t.*, Victoria, Australia; 75 m. from Melbourne; resort, gold-mng, wheat; p. *3,100*.
Dayton, *c.*, Ohio, U.S.A.; on Great Miami R.; univ.; aeroplanes, elec. machin., rubber goods; p. (1960) *262,332*.
Daytona Beach, *t.*, Fla., U.S.A.; resort, tr. and shipping, ctr.; p. (1960) *37,395*.
De Aar, *t.*, *rly. junction*, Cape Province, S. Africa; 500 m. from Cape Town; rlys. from N.W. (Luderitz, Walvis Bay) and S.E. (Pt. Elizabeth, E. London) join Cape Town to Johannesburg trunk rly.; p. *9,137*.
Dead Sea, *salt-water L.* between Israel and Jordan; surface 1,286 ft. below level of the Mediterranean; a. 340 sq. m., length 47½ m., greatest width 9½ m., greatest depth 1,309 ft.; receives waters of Jordan; high mineral content.
Deal, *mun. bor.*, *ancient spt.*, E. Kent, Eng.; on S.E. cst. 7 m. N.E. of Dover; opposite Goodwin Sands; seaside resort; Julius Cæsar is said to have first landed nr.; p. (1961) *24,791*.
Dean, Forest of, Gloucester, Eng.; between Wye and Severn Rs.; coal-mining.
Dearborn, *t.*, Mich., U.S.A.; p. (1960) *112,007*.
Dearne, *urb. dist.*, W.R. Yorks, Eng.; p. (1961) *26,453*.
Death Valley, *depression*, Cal., U.S.A.; in Mohave Desert, 150 m. N.E. of Los Angeles; completely arid; floor covered with saline deposits; tourist attraction; depth of valley floor 276 ft. below sea-level.
Debar, *t.*, Jugoslavia; nr. Drin R.; tr. ctr., cattle breeding, sulphur springs; p. *6,913*.
Debra Markos, *cap.* Gojjam prov., Ethiopia; p. approx. *5,000*.
Debrecen, *t.*, Hungary; 114 m. E. of Budapest; univ.; ctr. of pastoral dist.; fairs; pharmaceutics, medical instruments; p. (1965) *146,000*.
Decatur, *t.*, Ala., U.S.A.; steel, textiles; p. (1960) *29,217*.
Decatur, *t.*, Ga., U.S.A., p. (1960) *22,026*.
Decatur, *c.*, Ill., U.S.A.; mnfs., coal; p. (1960) *78,004*.
Decazeville, *t.*, Aveyron, S. France; coalmine (due for closure); p. (1954) *11,510*.
Deccan, The, gr. upland of S. India, bounded by the Narbada and Kistna Rs.
Dedham, *t.*, Mass., U.S.A.; p. (1960) *23,869*.
Dedza, *t.*, S. Malawi, new t., 1966.
Dee, *R.*, N. Wales and Cheshire; length 90 m.
Dee, *R.*, Aberdeen and Kincardine, Scot.; length 87 m.
Dee, *R.*, Kirkcudbright, Scot.; length 38 m.
Dee, *R.*, Louth, Ireland; flowing to Dundalk Bay; length 20 m.
Defiance, *t.*, N.W. Ohio, U.S.A.; light mftg., tr. and agr. ctr.; p. (1960) *14,553*.
De Funiak Springs, *t.*, Fla., U.S.A.; in agr. region; turpentine; p. (1960) *5,282*.
Dehdasht, *c.*, Iran; cap. Kuhgilvieh and Boer Ahmadi dist.; p. (1967) *112,544*.
Dehiwala (Mt. Lavinia), *t.*, Ceylon; p. (1963) *111,013*.
Dehra Dun, *t.*, Uttar Pradesh, India; p. (1961) *156,341*.
Deir-ez-Zor, *t.*, Syria; on Euphrates R.; on motor route between Damascus and Baghdad; p. (1961) *59,757*.
Dej, *t.*, on Szamos R., Romania; lge. distillery p. (1963) *22,827*.
Delabole, *vil.*, Cornwall, Eng.; on N.W. flank of Bodmin Moor; lge. slate quarries.
Delagoa Bay, *natural harbour*, Mozambique Port E. Africa; ch. pt. Lourenço Marques.
Delaware, *Atlantic st.*, U.S.A.; agr., lumber, fertilisers, minerals, leather, chemicals, machin. cap. Dover; ch. pt. Wilmington; a. 2,057 sq. m.; p. (1960) *446,292*.
Delaware, *R.*, flows from New York State along the Pennsylvania border, through New Jersey to Delaware Bay; length 350 m.
Delaware Bay, *inlet*, Atlantic cst., U.S.A.; drowned estuary of R. Delaware, extends 80 m. inland from C. May into heart of highly industl. a. of Philadelphia.
Delaware, *c.*, Ohio, U.S.A.; p. (1960) *13,282*.
Delft, *c.*, *pt.*, S. Holland, Netherlands; on Schie R., nr. Rotterdam; famous techn. univ.; ceramics (delftware), tool mftg., precision instruments; 13th cent. Old church and 15th cent. New church; p. (1967) *79,805*.
Delhi, *union terr.*, India; hot and arid region between Indus valley and alluvial plain of Ganges; irrigation to support agr.; New Delhi (*q.v.*) and Old Delhi chief ctrs.; a. 578 sq. m.; p. (1961) *2,359,408*.
Delitzsch, *t.*, Leipzig, E. Germany; 16 m. E. of Halle; sugar, chemicals; p. (1963) *23,614*.
Delmenhorst, *t.*, Lower Saxony, Germany; nr. Bremen; jute, woollens, linoleum, foodstuffs; p. (1963) *59,300*.
Delphi, in ancient Phocis, Central Greece, north of Gulf of Corinth; famous for Delphic oracle on Mt. Parnassus.
Del Rio, *spt.*, Texas, U.S.A.; mkt. for agr a., grapes; exp. wool, sheep; p. (1960) *18,612*.
Demavend, *mtn.*, 17,604 ft.; highest peak, Elburz Mtns., N. Persia, extinct volcano.
Demerara, *co.*, Guyana; between Essequibo and Demerara Rs.; exp. sugar, molasses, rum; p. (1946) *220,639*.
Demirkapu, "The Iron Gate," rocky defile, through which the Danube rushes, in the Transylvanian Alps.
Demmin, *t.*, Neubrandenburg, E. Germany; sugar ind.; p. (1963) *16,735*.

Diyarbakir, *t.*, Anatolia, Turkey; on Tigris R.; head of navigation; ancient Amida, old walls, gates, citadel; morocco leather, filigree work; p. (1965) *102,624*. [p. (1956) *52,153*.
Dizful, *t.*, Persia; 32 m. N.W. of Shushtar; indigo;
Djakarta (Batavia), *t.*, cap., Java, Indonesia; comm. ctr.; textiles; p. (1961) *2,973,052*.
Djambi, *dist.* and *t.*, Sumatra, Indonesia; on E. cst. plain 100 m. N.W. of Palembang; productive oil-field; a. (dist.) 17,345 sq. m.; p. (1961) of dist. *744,381* of t. *113,080*.
Djapara-Rembang, *prov.*, N.E. Java; petroleum, sugar, rice; a. 2,339 sq. m.; p. *1,885,548*.
Dneprodzerzhinsk, *t.*, Ukrainian S.S.R.; W. of Dnepropetrovsk on Dnieper R.; iron and steel, engin., chemicals; hydro-elec. sta. nearby; p. (1959) *194,000*.
Dnepropetrovsk, *t.*, Ukrainian S.S.R.; on Dnieper R.; univ.; coal, iron, steel, manganese, engin., chemicals, sawmilling, tyres; p. (1962) *722,000*.
Dneprorudnyy, *t.*, Ukrainian S.S.R.; new t. on S. shore of Kakhovta reservoir, tentatively called Dneprograd, now renamed; p. (1964) *6,000*.
Dneprostroy, *see* Zaporozhe.
Dnieper, *R.*, S.E. Europe; rises in U.S.S.R., flows into the Black Sea; connected by canals with Baltic, etc.; the Dneprostroy dam, a barrage erected across the R. at Kichkas by the Soviet Government, feeds the lgst. power-sta. in the world; length 1,400 m.
Dniester, *R.*, S.E. Europe; rises in Carpathians and flows into the Black Sea; length 700 m.
Doab, *dist.*, between "two rivers" Jumna and Ganges, Uttar Pradesh, India.
Döbeln, *t.*, Leipzig, E. Germany; machin., metallurgy, wood, cigar and sugar inds.; p. (1963) *29,327*.
Dobrich, *t.*, *see* Tolbukhin.
Dobruja, *dist.*, E. Romania; a. 6,102 sq. m., ch. pt. Constanta, traversed by ancient wall of Trajan; p. (1963) *517,016*.
Dobsina, *t.*, CSSR.; cave containing ice-field of 2 acres; asbestos, iron ore; p. *5,300*.
Doce, *R.*, Brazil; flows to Atlantic; length 400 m.
Dodecanese, gr. of 12 Greek Is. in Ægean Sea, to S. of Greek Archipelago; Italian 1912–46; a. 1,055 sq. m.; p. (1961) *122,346*.
Dodge City, *t.*, Kan., U.S.A.; p. (1960) *13,520*.
Dodoma, *mkt. t.*, Tanzania, E. Africa; 250 m. W. of Dar-es-Salaam on central Tanganyika rly. from Dar-es-Salaam to Kigoma; also on main N. to S. motor road.
Dodworth, *urb. dist.*, W.R. Yorks, Eng.; nr. Barnsley; coal; p. (1961) *4 139*.
Dogger Bank, *sandbank* in N. Sea, between England and Denmark; depth varies from 6 to 20 fathoms; valuable fishing ground; action between British fleet under Beatty and German fleet under Hipper; *Blücher* sunk Jan. 1915.
Dogs, I. of, *riverside dist.*, formed by bend in the R. Thames off Greenwich, London, Eng.; Millwall docks and shipbldg. yards.
Dokai Bay, *inlet*, N. Kyushu, Japan; landlocked bay on S. side of Shimonoseki Straits; flanked by highly industl. zone inc. Yawata, Wakamatsu, Tobata cs.; requires constant dredging; length 4 m., width ½–1½ m.
Dokkum, *t.*, Friesland, Netherlands; p. *5,073*.
Dôle, *t.*, Jura, E. France; on R. Doubs, nr. Dijon; ancient cap. of Franche-Comté, ceded to France in 1678; birthplace of Pasteur; p. (1954) *22,022*.
Dolgarrog, *sm. t.*, N.E. Caernarvon, Wales; on R. Conway; aluminium, milling; p. (1951) *572*.
Dolgelly, *urb. dist.*, *ch. t.*, Merioneth, N. Wales; agr., quarrying, timber; p. (1961) *2,267*.
Dollar, *burgh*, Clackmannan, Scot.; at foot of Ochil Hills, 6 m. N.E. of Alloa; noted for its academy founded in 1818 by Capt. John Mcnab; p. (1961) *1,955*.
Dollar Law, *mtn.*, nr. Peebles, Scot.; alt. 2,680 ft.
Dolomites, *gr. of limestone mtns.*, S. Tyrolese Alps, N.E. Italy; tourist district; peaks assume fantastic forms; principal peak, Marmolata 11,000 ft.
Dolon-Nor, *t.*, Mongolia, China; Buddhist temples; brass idols; p. *30,000*.
Dom, *mtn.*, Valais, Switzerland; alt. 14,942 ft.
Dominica, *aut. st.* in association with Gt. Britain; Windward Is., W.I.; limejuice, sugar, cacao, fruits, spices; extremely beautiful; cap. Roseau; a. 290 sq. m.; p.(estd. 1967) *65,000*.
Dominican Rep. indep. Spanish-speaking E. part of I. of Hispaniola, Antilles; cap. Santo Domingo; sugar, coffee, cacao, bananas, tobacco, bauxite, iron ore, cement; a. 19,332 sq. m.; p. (estd. 1965) *3,573,000*.
Domodossola, *frontier t.*, Piedmont, N. Italy, nr. Simplon; tourist ctr.; p. *10,350*.
Don, *R.*, Aberdeen, Scot.; flows into N. Sea; salmon; length 82 m.
Don, *R.*, W.R. Yorks, Eng.; trib. of R. Ouse, [length 70 m.
Don, *R.*, Maine-et-Loire, France; length 40 m.
Don, *lge. R.*, W. Russia; falls into Sea of Azov below Rostov; navigable to Voronezh; access to the Volga by the Don–Volga Canal.
Donaghadee, *spt.*, *urb. dis.*, Down, N. Ireland; nearest point to Scot.; carpets; seaside resort; p. (1961) *3,226*.
Donaueschingen, *t.*, Baden–Württemberg, Germany; at confluence of Rs. Brigach and Breg forming R. Danube; cas.; textiles; p. (estd. 1954) *8,900*.
Donawitz, *commune*, Styria prov., Austria; lignite, iron and steel; p. *17,623*.
Donbas, *industl. region*, Ukraine, U.S.S.R.; in valleys of Rs. Donetz and lower Dnieper; about 9,000 sq. m.; produces 60% Russia's coal; adjoins Krivoi Rog ironfields; many lge. industl. ts. [wine, fruit; p. *21,095*.
Don Benito, *t.*, Badajoz, Spain; tr. in wheat,
Doncaster, *t.*, *co. bor.*, W.R. Yorks, Eng., on Don R. 17 m. N.E. of Sheffield; rly. wks. mnfs. nylon; racecourse; p. (1961) *86,402*.
Donchery, *ancient t.*, Ardennes, France, on R. Meuse, nr. Sedan; scene of gr. battle 1870.
Donegal (Tirconnail), *co.*, N.W. Ireland; ch. t. Donegal, a. 1,865 sq. m.; p. (1961) *113,815*.
Donegal, *spt.*, *cap.*, Co. Donegal, Ireland; on W. cst. of Donegal Bay; homespun tweeds, carpets; p. (1951) *1,131*.
Donets, *R.*, Ukraine S.S.R., U.S.S.R.; rises in uplands of central Russia, flows S.E. 400 m. into R. Don; crosses impt. Donets coalfield. *See* Donbas.
Donetsk (Stalino), *t.*, Ukraine S.S.R.; coal, iron, steel, engin., chemicals; p. (1962) *760,000*.
Dongola, New, *t.*, Sudan; left bank of R. Nile above 3rd Cataract; replaced Old D., now in ruins; p. *5,000*.

Donna, *t.*, S. Texas, U.S.A.; sugar refining, fruit and vegetables; p. (1960) *7,522.*
Donnybrook, *t.*, W. Australia; S. of Perth; fruit.
Donzère-Mondragon, Provence, France; site of gr. barrage on Rhône supplying hydro-elec. power, completed 1952.
Doon, *R.*, Ayr, Scot.; flows from Loch Doon to Firth of Clyde; length 26 m.
Dora Baltea, *R.*, N. Italy; rises in Mt. Blanc, flows E. and S. through Val d'Aosta to R. Po at Chivasso; impt. routeway from N. Italy to Switzerland (through Gr. St. Bernard Pass) and France (through Little St. Bernard Pass); length 95 m.
Dora Riparia, *R.*, Italy; trib. of R. Po, flowing from Cottian Alps past Turin; length 60 m.
Dorchester, *mun. bor. co. t.* Dorset, Eng.; on R. Frome; Roman remains; lime, agr., engin., tent mkg.; p. (1961) *12,266.*
Dorchester, *pt. of entry*, N.B., Canada; on Penticodiac R.; p. *1,000.*
Dordogne, *dep.*, S.W. France; a. 3,550 sq. m.; cap. Périgueux; p. (1962) *375,455.*
Dordogne, *R.*, France; joins Garonne to form the Gironde; length 290 m.
Dordrecht, *c.*, nr. Rotterdam, Netherlands, on R. Merwede; timber, shipbldg., seaplanes; p. (1967) *88,475.*
Dorking, *mkt. t., urb. dist.*, Surrey, Eng.; on R. Mole to S. of gap through N. Downs; residtl.; light inds.; p. (1961) *22,594.*
Dornoch, *burgh*, Sutherland, Scot.; on N. side of Dornoch Firth; health resort; p. (1961) *933.*
Dorohoi, *t.*, Moldavia, Romania; 33 m. S.E. of Chernovtsy; gr. annual fair; p. (1956) *14,771.*
Dorp, *t.*, Germany; on R. Wupper, nr. Cologne; mnfs.; p. *14,000.*
Dorset, *co.*, S. Eng.; mainly agr.; sheep; Purbeck marble, Portland stone; co. t. Dorchester; a. 988 sq. m.; p. (1961) *309,176.*
Dorset Heights, *hills*, extend E. to W. across Central Dorset, Eng.; chalk, smooth slopes, few streams; short, dry, grass; pastoral farming, sheep; some cultivation where soil is deep enough; rise to 800–900 ft.
Dorsten, *t.*, N. Rhine-Westphalia, Germany; on R. Lippe; coal, iron, elec., chemical inds.; p. (1963) *37,600.*
Dortmund, *t.*, N. Rhine-Westphalia, Germany; impt. Ruhr comm. ctr.; coal, iron, steel, machin., brewing; p. (1963) *650,900.*
Dortmund-Ems Canal, N. Rhine-Westphalia, Germany; links Dortmund on Ruhr Coalfield with R. Ems 5 m. above Lingen; impt. coal, iron-ore traffic; length 90 m.
Dorval, *t.*, Quebec, Canada; p. (1961) *18,592.*
Dothan, *t.*, Ala., U.S.A.; p. (1960) *31,440.*
Douai, *t.*, Nord, France; nr. Lille on Scarpe R.; coal, iron and engin. wks.; bell founding, arsenal; p. (1962) *50,104.*
Douarnenez, *spt.*, Finistère, N.W. France; on D. Bay; sardine fisheries; p. (1954) *20,089.*
Doubs, *dep.*, E. France; traversed by the Jura range and the R. Doubs; chiefly agr.; watchmkg. ind.; cap. Besançon; a. 2,052 sq. m.; p. (1962) *384,881.*
Douglas, *cap.*, I. of Man; 75 m. W. of Liverpool, Eng.; seaside resort; p. (1956) *20,361.*
Douglas Point, on shore of L. Huron, Ont., Canada; nuclear power sta.
Dounreay, Caithness, Scot.; fast-breeder nuclear reactor.
Douro, *R.*, Portugal and Spain; enters Atlantic below Oporto; known as Duero R. in Spain; length 485 m.
Douro Littoral, *prov.*, Portugal; textiles, wine, fruit, cattle; cap. Oporto; a. 1,314 sq. m.; p. (1950) *1,237,170.*
Dove, *R.*, Derby and Staffs, Eng.; trib. of Trent; flows through beautiful dales; length 45 m.
Dover, *spt., mun. bor.*, Kent, Eng.; one of old Cinque pts.; nearest spt. to France, the Strait of D. being only 21 m. wide; chief pt. for passenger and mail traffic with Continent; p. (1961) *35,248.*
Dover, *cap.*, Del., U.S.A.; p. (1960) *7,250.*
Dover, *t.*, N.H., U.S.A.; p. (1960) *19,131.*
Dover, *t.*, N.J., U.S.A.; iron, munitions, explosives; knitwear, silk; p. (1960) *13,034.*
Dovercourt, *sub.*, Harwich, Essex, Eng.; seaside resort.
Dowlais, *mining dist.*, Merthyr Tydfil, S. Wales; fertilisers, nylon.
Down, *maritime co.*, N. Ireland; agr. and fisheries; industl. round Belfast; cap. Downpatrick; a. 957 sq. m.; p. (1961) *267,013.*
Downers Grove, *t.*, N.E. Ill., U.S.A.; dairy produce; tools, furniture; p. (1960) *21,194.*
Downey, *t.*, Cal., U.S.A.; agr.; aircraft, cement, asbestos prod., machin., soap.; p. (1960) *82,505.*
Downham Market, *t., urb. dist.*, Norfolk, Eng.; on R. Ouse; flour-milling, malting, sheet-metal wks.; p. (1961). *2,650*
Downpatrick, *urb. dist., co. t.*, Down, N. Ireland; on R. Quoile; linen; p. (1961) *4,219.*
Downs, *roadstead*, natural harbour of refuge for shipping between Kent coast and Goodwin Sands in the English Channel.
Downs, North and South, two chiefly pastoral broad chalk ridges in S.E. Eng.; N. Downs ending at Dover, and S. Downs at Beachy Head and enclosing the Weald; fine grazing ground for sheep.
Downton, *t.*, S. Wilts, Eng.; nr. Salisbury; on R. Avon; agr. college.
Drachenfels, *mtn. peak* on the Rhine, the steepest of the Siebengebirge range, nr. Königswinter; alt. 1,065 ft.; ascended by light rly.; famous cave of legendary dragon.
Draguignan, *cap.*, Var. dep., S.E. France; nr. Toulon; p. (1954) *13,402.*
Drakensberg, *mtn. chain* between Natal and Orange Free State, S. Africa; extending 500 m. from Gt. Fish R. to Olifants R.; highest peak Mont-aux-Sources 10,763 ft.; rly. crosses range by Van Reenen Pass.
Drama, *pref.* Macedonia, Greece; cap. Drama; p. (1961) *120,936.*
Drammen, *spt.*, Norway; nr. Oslo, on the Drammen R.; shipyard; exp. timber, wood-pulp, paper; p. (estd. 1960) *31,000.*

Dunstable, *t., mun. bor.*, Beds, Eng.; on N. edge of Chiltern Hills, 4 m. W. of Luton; motor vehicles, sparking-plugs, car components, engin., cement, rubber and plastic goods; p. (1961) *25,618.*
Duque de Caxias, *t.*, Rio de Janeiro st., Brazil; oil refining; p. (1960) *173,077.*
Duquesne, *c.*, Penns., U.S.A.; 9 m. S.E. of Pittsburgh; steelwks.; p. (1960) *15,019.*
Du Quoin, *c.*, Ill., U.S.A.; meat packing, flour, leather goods, shoes; p. (1960) *6,558.*
Durance, *R.*, S.E. France; trib. of Rhône; rapid current; length 217 m.
Durango, *inland st.*, N.W. Mexico; mining, agr., stock-raising; a. 42,272 sq. m.; p. (1960) *760,836.*
Durango, *cap.*, D. state, Mexico; cath.; silver, gold, copper, iron-ore; p. (1960) *70,000.*
Durant, *c.*, S. Okla., U.S.A.; cotton gins and compresses, cottonseed oil; p. (1960) *10,467.*
Durban, *spt.*, Natal, Rep. of S. Africa; ch. comm. t. in S.E. Africa; maize, wool, hides, oil and sugar refining, chemicals, textiles, engin.; oil pipeline to Johannesburg; p. (1960) *655,370* (inc. *194,276* Whites).
Düren, *t.*, N. Rhine–Westphalia, Germany; on R. Ruhr, 23 m. S.W. of Cologne; textiles, leather, machin., rly ctr.; p. (1963) *52,600.*
Durgapur, *t.*, W. Bengal; steel plant, coke oven plant; p. (1961) *41,696.*
Durham, *cath. c., mun. bor., co. t.*, Durham, N.E. Eng.; univ.; carpet, organ, confectionery mftg.; p. (1961) *20,484.*
Durham Co., N.E. Eng.; fertile valleys, moorland; coal, limestone; cattle; shipbldg., iron, steel, chemicals; a. 1,015 sq. m.; p. (1961) *1,517,039.*
Durham, *c.*, N.C., U.S.A.; tobacco factories; p. (1960) *78,302.*
Durlach, *t.*, Baden-Württemberg, Germany;

2½ m. E. Karlsruhe; cas.; cycles, machin.; p. (estd. 1954) *25,000*.

Dürrës (Durazzo), *spt.* Albania, on Adriatic; pt. for Tirana; tobacco ind.; p. (1960) *32,000*.

Dursley, *t.*, Glos., Eng.; 13 m. S. by W. of Gloucester; engin. inds., agr. mach.; p. *5,355*.

Duryea, *bor.*, Penns., U.S.A.; anthracite; silk; p. (1960) *5,626*.

Dushanbe (former Stalinabad), *t.* cap. Tadzhik S.S.R.; univ.; engin., textiles; p. (1962) *260,000*.

Düsseldorf, *cap.*, N. Rhine-Westphalia, Germany; on R. Rhine, 20 m. N. of Cologne; admin. and cultural ctr., art and medical academies; iron, steel, machin., soap, cars, paper, chemical inds.; impt. trans-shipment pt.; p. (1963) *704,000*.

Dust Bowl, *region*, U.S.A.; name applied to Great Plains on E. flank of Rocky Mtns.; subject to severe soil erosion by wind, particularly in drought years (1933, 1936) due to destruction of natural vegetation by excessive ploughing.

Dutch Guiana, *see* **Surinam**.

Dutch Harbour, *t.*, Unalaska I., Aleutian gr., N. Pac. Oc.; strategic American naval base.

Dvina, *R.*, (N.) flows to White Sea at Arkhangelsk, and is formed by the junction of the Rs. Sukhona and Vychegda, U.S.S.R.; connected by canal with Neva and Volga; length 1,000 m.

Dvina, *R.*, Latvia, U.S.S.R.; rises near sources of Volga and Dnieper, flows to G. of Riga; l. 65 m.

Dysart, *spt.*, *mun. bor.*, Fife, on F. of Forth, Scot.; linen, coal; p. *9,068*.

Dzaudzhikau, *see* **Ordzhonikidze**.

Dzerzhinsk, *indust. t.*, R.S.F.S.R.; W. of Gorki; chemicals (fertilisers, explosives); p. (1959) *163,000*.

Dzhalil, *t.*, R.S.F.S.R.; new t. 30 m. N.E. of Almetyevsk to serve new A. oilfield.

Dzhambul, *t.*, Kazakhstan S.S.R.; on R. Talis and Turksib rly.; chemicals; p. (1959) *67,000*.

Dzhezkazgan, *t.*, Kazakh S.S.R.; 350 m. W. of L. Balkhash; copper-mines; manganese ore nearby; p. (1956) *29,100*.

Dzierzoniow, *t.*, S.W. Poland, formerly Germany; ceded to Poland at Potsdam conference; textiles, machin.; cattle, grain mkt.; p. (1965) *31,000*.

Dzungaria, *broad trench* leading to the Mongolian plateau from the lowlands round L. Balkhash; formerly independent state.

E

Eagle Grove, *c.*, N. Iowa, U.S.A.; gypsum, agr.; p. (1960) *4,381*.

Ealing, *outer bor.*, Greater London; comprising former bors. of Acton, Ealing and Southall; p. (1964) *299,762*.

Earby, *urb. dist.*, W.R. Yorks, Eng.; cotton, plastic, cloths, agr. machin.; p. (1961) *4,963*.

Earlestown, *mftg. t.*, S. Lancs., Eng.; included in Newton le Willows urb. dist.; engin., glass.

Earn, *R.*, Perth, Scot.; issues from Loch Earn (6½ m. long) and flows into the Tay R.; length 46 m.

Earnslaw, *mtns.*, S. I., N.Z.; highest peak, 9,165 ft.

Easdale, *I.*, off W. Argyll, Scot.; nr. Oban; slate quarries.

Easingwold, *t.*, N.R. Yorks, Eng.; rope, steel, agr. ctr.; p. *2,043*.

East C., extreme N.E. point of Asia.

East C., extreme E. point of New Zealand, named by Capt. Cook on his first voyage in 1769.

East Anglia, *dist.*, comprising Norfolk and Suffolk, Eng.; former Anglo-Saxon kingdom.

East Anglian Heights, *hills*, extend S.W. to N.E. across N.E. Hertfordshire, N. Essex and S.W. Suffolk, Eng.; chalk overlain by glacial clays and sands; smooth, rolling surface; region of lge. farms and lge. fields, mixed farms mainly grain; rarely exceed 600 ft. alt.

East Barnet, *former urb. dist.*, Herts, Eng., now inc. in Barnet outer bor., Greater London (*q.v.*); residtl.; p. (1961) *40,641*.

East Bengal, E. *div.* of Pakistan; includes part of former Bengal Presidency; rice, jute, cotton; a. 5,091 sq. m.; p. (estd. 1951) *42,119,000*.

East Bridgewater, *t.*, Mass., U.S.A.; nr. Boston, p. (1960) *6,127*.

East Chicago, *c.*, Ind., U.S.A.; L. Michigan; iron and steel wks., oil refining; p. (1960) *57,669*.

East Cleveland, *t.*, Ohio, U.S.A.; residtl.; p. (1960) *37,991*.

East Greenwich, *t.*, Rhode I., U.S.A.; light mftg.; shellfish; summer resort; p. (1960) *6,100*.

East Grinstead, *t.*, *urb. dist.*, E. Sussex, Eng.; in ctr. of the Weald, 9 m. W. of Tunbridge Wells; agr. mkt.; famous hospital for plastic surgery; p. (1961) *15,421*.

East Ham, *former co. bor.*, Essex, Eng.; mftg. sub. E. of London, docks; chemicals; now inc. in Newham bor., Greater London.

East Indies (Malay Archipelago), gr. of Is. between Asia and Australia, inc. Borneo, Sulawesi, New Guinea, Sumatra, Java, Bali, Timor (see under Kalimantan and Indonesia); sugar, coffee, spices, fruits, rubber, tobacco, sago, tapioca, canes.

East Kilbride, *t.*, N. Lanark, Scot., 7 m. S.S.E. of Glasgow; designated "New Town" 1947; lge. agr. machin., aero engines, engin., elec. goods; seawater distillation plant; knitwear, clothing; p. (estd. 1965) *45,933*.

East Liverpool, *c.*, Ohio, U.S.A.; pottery mnfs.; p. (1960) *22,306*.

East London, *spt.*, C. Prov., S. Africa; at mouth of Buffalo R.; holiday resort; trading ctr.; inds. inc. car assembly, textiles, engin.; p. (1960) *114,584* (inc. *48,725* Whites).

East Lothian (Haddington), *co.*, S.E. Scot.; cereals, potatoes, sheep, coal; *co. t.*, Haddington, a. 267 sq. m.; p. (1961) *52,653*.

East Main R., Labrador, Newfoundland, Canada; flowing into James Bay.

East Moline, *t.*, Ill., U.S.A.; p. (1960) *16,732*.

East Orange, *t.*, N.J., U.S.A.; residtl. sub., New York; p. (1960) *77,259*.

East Pakistan, *prov.*, Pakistan; comprises E. terrs. of prov. of Bengal and former Assam dist. of Sylhet; divided into 3 divs. and 17 dists.; cap. Dacca; a. 54,501 sq. m.; p. (1961) *50,844,000*.

East Palestine, *t.*, Ohio, U.S.A.; clay, coal, oil, pottery; p. (1960) *5,232*.

East Providence, *t.*, Rhode I., U.S.A.; p. (1960) *41,955*.

East Retford, *mun. bor.*, Notts, Eng.; on R. Idle, 6 m. E. of Worksop; rubber, wire ropes, engin.; p. (1961) *17,788*.

East Riding, Yorkshire, *see* **Yorkshire, East Riding**.

East River, *tidal strait* about 16 m. long and from 600 to 4,000 ft. wide; the R. separates the bors. of Manhattan and Bronx from the bors. of Queens and Brooklyn.

East St. Louis, *c.*, *R. pt.*, Ill., U.S.A.; on Mississippi R.; large stockyards; meat packing; p. (1960) *81,712*.

East Stonehouse, *t.*, Devon, Eng.; adjoining Plymouth and Devonport.

Eastbourne, *t.*, *co. bor.*, E. Sussex, Eng.; on S. cst. to E. of Beachy Head; seaside resort; p. (1961) *60,897*.

Easter I., E. Pac. Oc., W. of Chile; stone images, ruins; p. *250*.

Eastern Province, Zambia; groundnuts, maize, tobacco; prov. ctr. Fort Jameson; a. 22,350 sq. m.; p. (1964) *507,000*.

Eastham, *vil.*, Cheshire, Eng.; on S. of Mersey estuary, nr. entrance to Manchester Ship Canal.

Easthampton, *t.*, Mass., U.S.A.; p. (1950) *10,694*.

Eastleigh, *t.*, *mun. bor.*, Hants, Eng.; locomotives; p. (1961) *36,577*.

Easton, *t.*, Mass., U.S.A.; p. (1960) *9,069*.

Easton, *c.*, Penns., U.S.A.; on Delaware R.; rly. ctr., coal, steel, machin., furniture; p. (1960) *31,955*.

Eastview, *t.*, Ontario, Canada; p. (1961) *24,555*.

Eastwood, *t.*, *urb. dist.*, Notts, Eng.; coal; p. (1961) *10,585*.

Eau Claire, *c.*, Wis., U.S.A.; on Chippewa R.; timber, paper, furniture; p. (1960) *37,987*.

Eaux Bonnes, Les, *wat. pl.*, Pyrenees, S. France.

Eaux Chaudes, *wat. pl.*, Pyrenees, S. France.

Ebal, Mt., Israel; opposite Gerizim; alt. 2,986 ft.

Ebbw Vale, *t.*, *urb. dist.*, Monmouth, Eng.; 17 m. N.W. of Newport; coal, iron, steel, tinplate, bricks, pipes, precast concrete; p. (1961) *28,631*.

Eberswalde, *t.*, Frankfurt, E. Germany; N.E. of Berlin; iron, wood and cardboard wks.; p. (1963) *32,906*.

Ebingen, *c.*, Württemberg, Germany; knitwear, velvet, precision tools; p. (1963) *21,400*.

Eboli, *t.*, Campagna, Italy; E. of Salerno.

Ebro, *R.*, N.E. Spain; flows to Mediterranean from Cantabrian Mtns.; length 440 m.

Ebury, *R.*, Monmouth, Eng.; trib. of Usk R.

Eccles, *mun. bor.*, Lancs, Eng.; 4 m. W. of Manchester; iron and steel, cotton, textiles, leather, chemicals, coal-mining; p. (1961) *43,184*.

Ecclesfield, *t.*, W.R. Yorks, Eng.; N. of Sheffield; cutlery.

Eccleshall, *mkt. t.*, Staffs, Eng.; 6 m. N.W. of Stafford; p. *3,630*.
Echague, *t.*, Philippine Is.; tobacco ctr.
Echternach, *t.*, Luxembourg; famous abbey; Whitsun dancing-procession; p. (1960) *9,820*.
Echuca, *t.*, Victoria, Australia; on R. Murray; 50 m. N.E. of Bendigo; rly. ctr.; irrigation wks.; wine, sheep; p. (1951) *6,000*.
Ecija, *t.*, Seville, Spain; olive oil, wine, pottery; the Roman Astigi; p. *34,944*.
Eck, Loch, *L.*, Argyll, Scot.; 6 m. long.
Eckernförde, *spt.*, Schleswig-Holstein, Germany; on Baltic N.W. of Kiel; fishing; resort; p. (1963) *20,400*.
Eckington, *t.* Derby, Eng.; S.E of Sheffield; coal, agr. implements; p. *14,614*.
Ecorse, *t.*, Mich., U.S.A.; p. (1960) *17,328*.
Ecuador, *rep.*, S. America; on Equatorial Pacific cst.; Andes mtns.; Chimborazo, 20,600 ft.; climate: lowlands tropical, uplands cool and dry; race chiefly Indian speaking the Quechua language; poor communications; cocoa, sugar, coffee, cereals, fruits, gold, copper, silver, Panama hats; cap. Quito; a. 106,508 sq. m.; p. (estd. 1965) *4,877,000*.
Edam, *t.*, S. Holland, Netherlands; on cst. IJsselmeer; cheese, tool mftg.; p. (1967) *16,558*.
Eday, *I.*, Orkney Is., Scot.; the Ocelli of Ptolemy.
Ed Damar, *cap.*, Northern Prov., Sudan; p. (estd. 1949) *8,000*.
Eddystone, *rock with lighthouse*, Eng. Channel; 15 m. S.W. of Plymouth.
Ede, *t.*, Gelderland, Netherlands; livestock; pianos; p. (1967) *67,558*.
Ede, *t.*, W. Prov., Nigeria; p. *57,500*.
Eden, *R.*, Westmorland, Eng.; rises in Pennines, flows N.W. to Solway Firth below Carlisle; length 65 m.
Eden, *t.*, N.S.W., Australia; on Tasman Sea; p *661*.
Edenton, *t.*, N.C., U.S.A.; groundnuts, cotton, herring fisheries; p. (1960) *4,458*.
Edessa (Edhessa), *t.*, *cap.*, Pella prefecture, Macedonia, Greece; p. (1961) *15,534*.
Edfu, *see* **Idfu.**
Edgbaston, *residtl. dist.*, Birmingham, Eng.
Edgehill, *ridge*, 15 m. S. Warwick, Eng.; first battle in Civil War, 1642.
Edgewater, *t.*, N.J., U.S.A.; sub., connected by ferry with New York; p. (1960) *4,113*.
Edgware, *t.*, Middlesex, Eng.; N. sub. of London; residtl.; p. (1961) *20,127*.
Edina, *t.*, Minn., U.S.A.; p. (1960) *28,501*.
Edinburgh, *c.*, Midlothian; cap. Scot.; royal burgh on F. of Forth; univ., cas.; palace (Holyrood); printing, publishing, brewing; Edinburgh Festival in August; Leith, with docks is joined to E.; p. (1961) *468,378*.
Edirne, *c.*, Turkey; on left bank of the Marica R.; greatly developed by Hadrian 125; residence of the Sultans 1366–1453; wine, tobacco, silk, perfume; p. (1965) *46,264*.
Edjelé, *t.*, nr. Tripoli, Algeria, Africa; oilfields.
Edmonton, *c.*, cap. Alberta, Canada; fast-growing c. (46 sq. m.) on both sides of N. Saskatchewan R.; high-level bridge links Strathcona; immense war-time activity ("invasion"), now major Canadian military ctr.; univ.; international air ctr.; oilfields and farming; oil and chemical inds.; p. (1961) *337,568*.
Edmonton, *former mun. bor.*, Middlx., Eng.; now inc. in Enfield outer bor., Greater London (*q.v.*); residtl.; light inds.; p. (1961) *91,956*.
Edremit, *t.*, Balikesir, N.W. Turkey; cereals, opium; silverwk.; p. (1960) *22,246*.
Edward, *L.*, on frontier of Uganda and the Congo (ex-Belgian), one of the sources of R. Nile; alt. 3,000 ft., length 44 m., breadth 32 m.
Edwardsville, *t.*, Ill., U.S.A.; p. (1960) *9,996*.
Eekloo, *t.*, E. Flanders, Belgium; textiles; p. (1962) *18,571*.
Eger, *c.*, Hungary; wine, soap; cath.; p. (1962) [illegible]
Egersund, *spt.*, S. cst., Norway; pottery, china, engin.; fishing; p. (1960) *3,868*.
Eggan, *R. pt.*, Ilorin, Nigeria; p. *10,000*.
Egham, *urb. dist.*, Surrey, Eng.; on R. Thames, nr. Staines; contains field of Runnymede, where King John signed Magna Carta; residtl.; p. (1961) *30,553*.
Egmont, *mtn.*, N.I., N.Z.; volcanic; alt. 8,200 ft.
Egremont, *mkt. t.*, Cumberland, Eng.; 10 m. S. of Whitehaven; limestone, iron ore; p. *16,727*.
Egypt, *see* **United Arab Republic.**
Ehen, *R.*, Cumberland, Eng.; issues from Ennerdale Water to Irish Sea; length 12 m.
Ehrenbreitstein, *t.*, *fort.*, Germany; on R. Rhine opposite Koblenz.
Eibar, *c.*, Guipuzcoa, N. Spain; iron, steel mftg., ordnance wks.; p. (1957) *16,318*.
Eibenstock, *t.*, Saxony, Germany; p. *7,760*.
Eider, *R.*, Germany; connected with Kiel canal; length 90 m.
Eifel, *plateau of ancient rocks*, W. Germany; lies N. of R. Moselle, terminates in steep slope forming W. edge of Rhine gorge between Koblenz and Bonn; drained by Kyll, Ahr, Rur; formerly cultivated, now largely woodland and moorland; farming in valleys; rises to just over 2,000 ft.
Eiger, *mtn.*, one of the highest peaks of the Bernese Oberland, Switzerland; alt. 13,042 ft.
Eigg, *I.*, Inner Hebrides, Scot.; 15 m S.W. of Mallaig; basaltic rocks on cst.; rises to 1,289 ft.
Eilat, *new spt.*, Negev, Israel; on Gulf of Akaba; oil; copper at Timna; p. (estd. 1953) *400*.
Eildon Hills, Roxburgh, Scot.; S. of Melrose; highest point 1,385 ft.
Eilenburg, *t.*, Leipzig, E. Germany; rly. junction; machin., chemicals; p. (1963) *21,050*.
Eindhoven, *c.*, N. Brabant, Netherlands; electronic equipment, motor vehicles, tobacco and textile inds.; techn. univ.; p. (1967) *183,637*.
Einsiedeln, *t.*, Schwyz, Switzerland; monastery, pilgrim ctr.
Eire, *see* **Ireland, Republic of.**
Eisenach, *t.*, Erfurt, E. Germany; on R. Hörsel, at foot of Thuringian forest; ctr. of Werra potash field; cars, machin., textiles; birthplace of J. S. Bach; p. (1963) *47,854*.
Eisenberg, *t.*, Gera, E. Germany; pianos, porcelain, cement, machin.; p. (1963) *13,666*.
Eisenerz Alps, *mtn. range*, Austria; most northerly range of Alps, overlooking Danube valley between Linz and Vienna; impt. iron-ore deposits; alt. from 6,000 to 9,000 ft.
Eisenhüttenstadt, *t.*, Frankfurt, E. Germany; iron smelting; p. (1963) *35,671*.
Eisleben, *t.*, Halle, E. Germany; birthplace of Luther; machin., copper- and silver-mining ctr.; p. (1963) *33,589*.
Ekibastuz, *t.*, Kazakhstan S.S.R.; 75 m. S.W. of Pavlodar; ctr. of rapidly developing mng. a. coal, gold, metals; coal-fed generating plant projected, to supply power to European Russia; p. (1956) *15,000*.
El Alamein, *vil.*, U.A.R.; in Libyan Desert 60 m. S.W. of Alexandria, scene of gr. Allied victory, Second World War.
El Callao, *t.*, Bolivar, st., Venezuela; in ctr. of Guiana Highlands, 125 m. S.E. of Ciudad Bolivar; ctr. of impt. gold-mining region.
El Centro, Cal., U.S.A.; rich agr. a. reclaimed from the desert; p. (1960) *16,811*.
El Dorado, *t.*, Ark., U.S.A.; oil; p. (1960) *25,292*.
El Dorado, *t.*, Kan., U.S.A.; p. (1960) *12,523*.
El Faiyûm or **El Fayum,** *oasis t.*, *cap.* of Faiyûm prov., U.A.R.; nr. L. Moeris; predynastic arch. finds; lgst. cultivated a. of U.A.R. outside Nile flood plain; uranium; p. (1960) *102,000*.
El Fasher, *cap.*, Darfur Prov., Sudan; p. (estd. 1961) *28,462*.
El Hasa, *dist.*, Saudi Arabia; on Persian Gulf, ch. t. Hofuf.
El Jadida (Mazagan), *spt.*, Morocco; grain and wool tr.; p. (1960) *40,302*.
El Khârga, *oasis*, Libyan desert, U.A.R.; 85 m. S.W of Asyut; p. *5,000*.
El Misti, *volcano*, Peru, S. America; N.E. of Arequipa; alt. 19,170 ft.
El Obeid, *cap.*, Kordofan, Sudan; 200 m. S.W. of Khartoum; ivory, gums, ostrich feathers; p. (estd. 1961) *56,970*.
El Oro, *prov.*, Ecuador; cap. Machala; a. 2,238 sq. m.; p. (estd. 1962) *162,591*.
El Paso, *c.*, Texas, U.S.A.; on Rio Grande; natural gas distribution, ore refining; p. (1960) *276,687*.
El Quantara (El Kantara), *t.*, U.A.R.; on E. bank of Suez Canal, 21 m. S. of Pt. Said; terminus of Palestine Rly. system; linked by ferry across canal (and temporary swing bridge) to El Quantara (W.) on Egyptian Rly. systems.
El Salvador, *see* **Salvador.**
El Teniente, *t.*, central Chile; copper-mines; p. *11,761*.

Elan, *R.*, Radnor, Wales; rises on S.E. sides of Plynlimon, flows S.E. then N.E. into R. Wye at Rhayader; lower valley contains series of 4 lge. reservoirs, length 4 m., capacity 10,000 million gall.; ch. source of water for Birmingham.

Elâzig, *t.*, E. Turkey; dam and hydro-elec. project planned at Keban, 30 m. to N.W. at confluence of E. and W. branches of Euphrates; p. (1965) *78,899*.

Elba, *I.*, off Tuscan cst., Italy; iron ore, wine, marble, salt; Napoleon's first exile here; ch. t. Porto Ferrajo; a. 140 sq. m.; p. (1960) *26,000*.

Elbasan, *prefecture*, Albania; cap. Elbasan; p. (1958) *430,000*.

Elbe, *R.*, Czechoslovakia, Germany; the Roman "Albis"; rises in Bohemia and flows into N. Sea at Cuxhaven, 65 m. below Hamburg; navigable for 500 m. of total length 725 m.

Elbert, *mtn.*, Col., U.S.A.; alt. 14,420 ft.

Elbeuf, *t.*, Seine-Maritime, France; woollens; p. (1954) *17,293*.

Elblag (Elbing), *spt.*, N. Poland (since 1945), formerly in E. Prussia; shipbldg., machin., vehicles; p. (1965) *85,000*.

Elbruz Mt., Caucasus, highest in Europe (18,480 ft.), over-topping Mont Blanc by 2,698 ft.

Elburz, *mtn. range*, N. Iran; bordering on Caspian Sea; highest peak, Demavend, 18,500 ft.

Elche, *t.*, Alicante, Spain; 15 m. S.W of Alicante; palm groves; oil, soap; p. (1959) *72,706*.

Eldorado, *radium mine*, N.W. Terr., N. Canada; situated on E. shore of Gr. Bear Lake nr. Arctic Circle; produces 40% of world's radium, sent to Pt. Hope, Ontario, for refining.

Electra, *t.*, N. Texas, U.S.A.; oil; drilling tools and equipment; p. (1960) *4,759*.

Elektrenai, *t.*, Lithuanian S.S.R.; new township nr. Vievis, at site of thermal power sta.

Elektrostal, *t.*, R.S.F.S.R.; 35 m. E. of Moscow; steel, engin.; p. (1959) *97,000*.

Elephant Butte Dam, N.M., U.S.A.; on Rio Grande, 125 m. above El Paso; built to control flood water; lake, a. 60 sq. m., supplies irrigation water to 780 sq. m. in N.M. and Texas, water also supplied to Mexico.

Elephanta, *I.*, Bombay Harbour, India; cave sculptures.

Elephantine, *I.*, in Nile, Upper U.A.R.; site of nilometer.

Eleusis, *t.*, Greece; nr. Athens; ship repair yard; [engin. wks.

Eleuthera, *I.*, Bahamas, T.W.I.; p. (1953) *6,070*.

Elgin, *t.*, Ill., U.S.A.; watches, elec. goods, machin. chemicals, wood prod.; p. (1960) *49,447*.

Elgin, *co. t.*, *burgh*, Moray, Scot.; ancient ruined cath.; woollens; p. (1961) *11,971*.

Elgon Mt., *extinct volcano*, on bdy. of Kenya and Uganda; 40 m. in diam.; alt. 14,100 ft.; cave dwellings on slopes.

Elie and Earlsferry, *burgh*, Fife, Scot.; summer resort; p. (1961) *1,128*.

Elisabethville, *see* **Lubumbashi.**

Elizabeth, *mftg. t.*, N.J., U.S.A.; univ.; sewing machines, iron, oil-ref.; p. (1960) *107,698*.

Elizabeth, satellite t. 17 m. N. of Adelaide, S. Australia; p. (1966) *47,000*, proposed p. *60,000*.

Elizabeth, *t.*, N.C., U.S.A.; timber ind.; p. (1960) 14,062.

Forfar, *burgh*, Angus, Scot.; in Strathmore, 17 m. S.W. of Montrose; linen, jute; p. (1961) *10,252.*
Forli, *ancient c.*, Emilia Italy; silk factories, ironwks.; felt; p. (1961) *91,146.*
Formby, *t., urb. dist.*, Lancs, Eng.; on W. cst., 6 m. S.W. of Southport; p. (1961) *11,730.*
Formentera, *I.*, Balearic Is., S. of Ibiza; 13 m. long; cereals, wine, tunny fishing; p. (1957) *2,657.*
Formia, *t.*, Caserta, Italy; the ancient Formiæ.
Formigine, *t.*, Modena prov., N. Italy; silk, leather; p. *10,985.*
Formosa, *see* **Taiwan.**
Formosa, *prov.*, N. Argentina; bordering on Paraguay; timber; cap. Formosa; a. 27,825 sq. m.; p. (1960) *178,000.*
Fornaes, *c.*, extreme E. point of Jutland.
Forres, *burgh*, Moray, Scot.; nr. mouth of R. Findhorn, 25 m. E. of Inverness; distilling, oat and woollen mills; p. (1961) *4,780.*
Forst, *t.*, Cottbus, E. Germany; on R. Neisse; E. section of t. Polish since 1945; textiles; p. (1963) *28,981.*
Fort Augustus, *vil.*, Inverness, Scot.; at S.W. end of Loch Ness; on Caledonian Canal; Fort now Abbey.
Fort Collins, *c.*, Col., U.S.A.; ctr. of rich farming a.; grain, sugarbeet, livestock; site of Colorado State Univ.; p. (1960) *25,027.*
Fort de France (formerly Fort Royal), *cap.*, Martinique, W. Indies; has a land-locked harbour of some 16 sq. m.; exp. rum, sugar; p. (estd. 1960) *60,648.*
Fort Dodge, *t.*, Iowa, U.S.A.; on Des Moines R., in rich agr. cty.; grain, pottery, coal; p. (1960) *28,399.*
Fort Frances, *t.*, Ontario, Canada; pulp, lumbering; p. (1961) *9,481.*
Fort George, *R.*, Labrador, Canada; flowing into James Bay.
Fort Johnson, *t.*, S. Malawi, on L. Malombe; new t., 1966; tobacco; airpt.
Fort Lamy, *t., cap.*, Chad, Africa; p. (1965) *92,000.*
Fort Lamy, *t., cap.*, Chad, Africa; p. *18,465.*
Fort Lauderdale, *t.*, Fla., U.S.A.; prefab. bldg. mftg., concrete prod., fertilisers; p. (1960) *83,648.*
Fort Madison, *c.*, Iowa, U.S.A.; meat packing; p. (1960) *15,247.*
Fort Myers, *t.*, Fla., U.S.A.; p. (1960) *22,523.*
Fort Pierce, *t.*, Fla., U.S.A.; p. (1960) *25,256.*
Fort St. John, *t.*, B.C., Canada; on Peace R.; oilfield; p. (1961) *3,619*
Fort Scott, *t.*, Kan., U.S.A.; maize, wheat, cattle; p. (1960) *9,410.*
Fort Smith, *c.*, Ark., U.S.A.; on Arkansas R.; rly. ctr., cotton, maize, wagons, furniture; p. (1960) *52,991.*
Fort Victoria, *t.*, Rhodesia; agr. and mining ctr., cattle; historic ruins in Zimbabwe Nat. Park; p. (1958) *10,700* (incl. *1,700* Europeans).
Fort Wayne, *c.*, Ind., U.S.A.; rly.-carriage bldg. and machine shops; p. (1960) *161,776.*
Fort William, *c.*, Ontario, Canada; on L. Superior; grain pt.; p. (1961) *45,214.*
Fort William, *burgh*, Inverness, Scot.; nr. head of Loch Linnhe, at base of Ben Nevis; aluminium factory; pulp- and paper-mill at Corpach; p. (1961) *2,715.*
Fort Worth, *c.*, Texas, U.S.A.; rly. and comm. ctr. on Trinity R.; livestock and grain mkt.; petroleum, meat packing, aeroplanes, oilfield equipment; site of Texas Christian Univ.; p. (1960) *356,268.*
Fort Yukon, Alaska, U.S.A.; trading sta. on Yukon R.; p. *274.*
Fortaleza, *cap.*, Ceará st., Brazil; exp. sugar, rubber, cotton, carnauba wax; p. (1960) *514,818.*
Fortescue, *R.*, W. Australia.
Forth, *R.*, Scot.; rises on Ben Lomond, and flows E. into F. of Forth nr. Alloa; length 65 m.
Forth Bridge, *rly. bridge*, Scot.; spans F. of Forth between N. and S. Queensferry; length 1¼ m. Forth road bridge (suspension) just upstream opened 1964; length 5,980 ft.
Forth, Firth of, *lge. inlet*, E. cst. of Scot.; submerged estuary of R. Forth; navigable by lge. vessels for 40 m. inland to Grangemouth; other pts., Leith, Rosyth (naval), Bo'ness; length (to Alloa) 50 m., width varies from 1 to 13 m.
Forth and Clyde Canal, Scot.; links F. of Forth at Grangemouth, and F. of Clyde at Glasgow; length 38 m.
Fortrose, *t., burgh*, Ross and Cromarty, Scot.; on S. cst. of Black Isle, on Moray Firth; p. (1961) *902.*
Fortune Bay, *inlet*, S. cst. of Newfoundland, [Canada.
Fossano, *t.*, Italy; nr. Turin; cath.; paper, silk; p. *21,850.*
Fos-sur-mer, *t.*, Bouches-du-Rhône, S. France; nr. Marseilles; oil refinery.
Fostoria, *t.*, Ohio, U.S.A.; glass, quarries, stockyards; p. (1960) *15,732.*
Fotheringhay, *vil.*, on R. Nene, Northampton, Eng.; Mary Queen of Scots beheaded in F. Castle, 1587.
Fougères, *t.*, Ille-et-Vilaine, France; cas.; p (1954) *23,151.*
Fougerolles, *t.*, Haute-Saône, France.
Foula, I., Shetland Is., Scot.; westward of main gr.
Foulness Island, Essex, Eng.
Foulweather, *C.*, Ore., U.S.A.
Fountains Abbey, fine ruin, Cistercian, founded 1132, W.R. Yorks, Eng.; nr. Ripon.
Fourmies, *t.*, Nord, France; nr. Valenciennes; p. (1954) *13,414.*
Foveaux Strait, N.Z.; separates S.I. from Stewart I.
Fowey, *spt., mun. bor.*, Cornwall, Eng.; on W. of Fowey estuary, 22 m. W. of Plymouth; seaside resort, fishing; exp. kaolin; p. (1961) *2,237.*

Fox Is., one of the Aleutian Is. gr.
Foxe Basin and Channel, to N. of Hudson Bay, between Baffin I. and Southampton I.
Foxe Peninsula, Baffin I., Franklin, Canada.
Foyers, *falls*, Inverness, Scot.; E. of Loch Ness, nr. Fort Augustus; aluminium wks., hydro-elec. scheme.
Foyle, Lough, estuary of Foyle R., between Donegal and Londonderry, N. Ireland.
Framingham, *industl. t.*, Mass., U.S.A.; 10 m. W. of Boston; p. (1960) *44,526*.
Framlingham, *mkt. t.*, E. Suffolk, Eng.; 15 m. N.E. of Ipswich.
Franca, *c.*, São Paulo st., Brazil; 160 m. N. of Campinas; p. (1960) *47,244*.
Francavilla, *t.*, Lecce, Italy; wine, oil, leather; p. *21,375*.
France, *rep.* (*former monarchy and empire*), W. Europe, bounded N. by Belgium and English Channel, W. by the Bay of Biscay, S. by the Pyrenees and the Mediterranean, E. by Italy, Switzerland and Germany. Greatest length about 600 m., greatest breadth 540 m.; a. 212,600 sq. m., or 3½ times size of England and Wales; F. is divided into 95 metropolitan deps.; ch. ts. are Paris (the cap., the fifth lgst. c. in Europe), Bordeaux, Marseilles, Lyons, Lille, Nice and Toulouse: 19 univs.; ch. mtns.: Cevennes, Jura, Vosges, Pyrenees; ch. Rs.: Seine, Loire, Rhône, Garonne; climate, temperate; agr.: wheat, oats, potatoes, sugar-beet, vine, fruits, silk, cattle, sheep, dairying; minerals: coal, iron, bauxite, potash; mnfs.: iron and steel, machin., textiles; communications excellent; p. of the Rep. (1965) *48,492,700*. The French Community was set up in 1959 as successor to the French Union.
Franceville, *t.*, Gabon, Equatorial Africa; on R. Ogowe; manganese mines opened 1962.
Francisco Morazán, *dep.* central Honduras; a. 3,870 sq. m.; p. (1961) *284,540*.
Francis Lake, *L.*, Yukon, Canada.
Francistown, *gold-mining t.*, Botswana, Africa; p. *10,000*.
Frankental, *t.*, Rhineland Palatinate, Germany; N.W. of Mannheim; engin., farm implements, metallurgy, cork; p. (1963) *35,800*.
Frankfort, *t.*, Ky., U.S.A.; mining, horse-breeding; p. (1960) *18,365*.
Frankfort, *t.*, Ind., U.S.A.; p. (1960) *15,302*.
Frankfurt-on-Main, *c.*, Hessen, W. Germany; restored cath.; univ.; birthplace of Goethe; machin., cars, chemicals, publishing, elec. engin., transhipment pt., impt. airfield; p. (1963) *694,200*.
Frankfurt-on-Oder, *t.*, E. Germany; 50 m. from Berlin; gr. route ctr.; machin., iron; E. section of t. (Slubice) Polish since 1945; p. (1963) *58,339*.
Frankischer (Franconian) Jura, *plateau with steep N.-facing edge*, S.W. Germany; runs 80 m. S.W. from Fichtel Gebirge (Fir Mtns.), highest elevation just exceeds 3,000 ft.; drained by Regnitz Altmühl; slate quarrying; vine, maize in sheltered valleys.
Franklin, *t.*, N.H., U.S.A.; p. (1960) *6,742*.
Franklin, *bor.*, N.J., U.S.A.; ctr. of U.S. zinc ind.; p. (1960) *3,624*.
Franklin, *c.*, Penna., U.S.A.; petroleum, oil-well tools, rolling stock; p. (1960) *9,586*.
Franklin, *t.*, Tasmania, Australia; 20 m. from Hobart; principal fruit-growing dist. in the island.
Franklin, *dist.*, N.W. Terr., Canada; comprising the Is. of Arctic Canada from Banks I. to Baffin I., including Boothia Peninsula and Melville Peninsula; sparsely populated; furs; a. 554,032 sq. m.
Frantiskové Lázne (Franzensbad), *t.*, W. Bohemia; famous spa; CSSR
Franz Josef Land, U.S.S.R., *archipelago* in Arctic Ocean; N. of Novaya Zemlya; a. 7,050 sq. m.; mainly ice-covered.
Frascati, *t.*, Italy; 12 m. S.E. of Rome; summer resort; famous villas and arch. remains; nuclear research ctr.; p. *11,425*.
Fraser, *R.*, B.C., Canada; rises at 6,000 ft. on W. slopes Rocky Mtns.; famous salmon fisheries; lenth 850 m.
Fraserburg, *agr. t.*, Cape Province, S. Africa; supply sta. for stock-raisers between Calvinia and Carnarvon.
Fraserburgh, *est. burgh*, N.E. Aberdeen, Scot.; extreme N.E. of Buchan peninsula; impt. herring fishery; tool factory; p. (1961) *10,462*.
Fraserville, *t.*, Quebec, Canada; on St. Lawrence R.
Fratta Maggiore, *t.*, Italy; 6 m. from Naples; p. *18,100*.
Frauenfeld, *cap.*, Thurgau, Switzerland; cas.; cotton; p. (1957) *10,048*.
Fray Bentos, *t.*, *cap.*, Rio Negro, Uruguay; on R. Uruguay 50 m. from its mouth; meat canning and salting, meat extracts; p. (1963) *14,000*.
Frechen, *t.*, N. Rhine-Westphalia, Germany; W. of Cologne; lignite, pottery; p. (1963) *28,000*.
Fredericia, *spt.*, *t.*, Velle, Jutland, Denmark; traffic ctr., barracks; new bridge over Little Belt; textiles, silver and plates wks., art. fertilisers; oil refinery projected; p. (1960) *29,870*.
Frederick, *c.*, Md., U.S.A.; canning, tanning; p. (1960) *21,744*.
Fredericksburg, *t.*, Va., U.S.A.; scene of severe Federal rebuff, Civil War; p. (1960) *13,639*.
Fredericton, *t.*, *cap.*, N.B., Canada; on St. John R.; univ., cath.; lumbering; p. (1961) *19,683*.
Frederiksberg, *sub.*, Copenhagen, Denmark; p. (1960) *114,285*.
Frederikshaab, *sm. spt.* on W. cst. of Greenland.
Frederikshavn, *spt.*, *fishing t.*, N. cst. of Jutland; iron wks., canneries; p. (1960) *22,522*.
Frederikstad, *t.*, Norway; at mouth of Glommen R.; tr. ctr.; pulp, paper, electrotechnical inds., shipbldg., whale oil refining; p. (1960) *13,746*.
Fredonia, *t.*, N.Y., U.S.A.; p. (1960) *8,477*.
Freehold, *t.*, N.J., U.S.A.; p. (1960) *9,140*.
Free Port, *mftg. t.*, Ill., U.S.A., on the Pecatonica R.; p. (1960) *26,628*. [(1960) *34,419*.
Free Port, *t.*, Long Island, N.Y.; U.S.A.; p.
Freeport, *spt.*, Texas; sulphur, chemicals, magnesium from sea; p. (1960) *11,619*.
Freetown, *cap.*, Sierra Leone, W. Africa; univ.; coaling sta.; exp. palm oil; diesel power plant; p. (1963) *128,000*.
Fregenal de la Sierra, *t.*, Spain; nr. Badajoz; p. (1957) *11,716*.
Freiberg, *c.*, Karl-Marx-Stadt, Germany; cath.; cas.; metallurgy, textiles, glass, porcelain; p. (1963) *48,062*.
Freiburg (Fribourg), *can.*, Switzerland; much forest and unproductive land; a. 645 sq. m.; p. (1961) *159,194*.
Freiburg, *cap.*, Freiburg, Switzerland; between Berne and Lausanne; fine viaduct and bridges; univ.; machin., chocolate; p. (1957) *29,005*.
Freiburg, *t.*, Baden-Württemberg, Germany; in Black Forest; cath., univ.; textiles, paper, metallurgy; p. (1963) *150,400*.
Freising, *c.*, Bavaria, Germany; cath.; agr. machin., textiles, brewing; p. (1963) *28,800*.
Freital, *t.*, Dresden, E. Germany; coal-mining, iron, leather, glass, uranium ore processing; p. (1963) *35,805*.
Fréjus, *cst. t.*, Var, France; p. (1954) *13,452*.
Fréjus, Col de, the Alpine pass under which the Mont Cenis tunnel runs.
Fremantle, *spt.*, W. Australia; at mouth of Swan R., 12 m. S.W. from Perth, principal pt. of commerce in W. Australia and first Australian pt. of call for mail steamers; p. (1947) *27,926*.
Fremont, *t.*, Cal., U.S.A.; p. (1960) *43,790*.
Fremont, *t.*, Nebraska, U.S.A.; on Platte R.; 33 m. from Omaha; flourmills, canneries; p. (1960) *19,698*.
Fremont, *c.*, Ohio, U.S.A.; on Sandusky R.; petroleum field; p. (1960) *17,573*.
Fremont's Peak, highest peak of Wind River Range, Wyoming St., U.S.A.; alt. 13,570 ft.
French Equatorial Africa, formerly comprised the French African cols. Gabon (cap. Libreville), Middle Congo (cap. Brazzaville), Ubangi-Shari (cap. Bangui), and Chad (cap. Fort Lamy); timber, ivory; a. 953,740 sq. m.; p. (1957) *4,879,000*. These sts. are now indep. within Fr. Community. *See* under separate headings: Gabon, Congo, Central African Rep., Chad.
French Guiana, *col.*, S. America; forests; cocoa, gold, phosphates; lge. deposits of bauxite at Kaw Mt. to be exploited; poor communications; cap. Cayenne; a. 34,740 sq. m.; p. (estd. 1965) *36,000*.
French, *R.*, Ontario, Canada; the outlet of L. Nipissing into L. Huron.
French Somaliland, *see* Afars and Issas.
French Soudan. *See* Mali.
French West Africa, comprised former French cols. of Dahomey, Ivory Coast, Mauritania, Niger,

French Guinea, Upper Volta, Senegal, French Soudan.

Freshwater, *sm. t., bathing resort,* I. of Wight, Eng.; at W. end of I., 8 m. W. of Newport.

Fresnillo, *t.,* Zacatecas St., Mexico; p. *25,000.*

Fresno, *c.,* Cal., U.S.A.; ctr. of impt. irrigated fruit-growing dist.; dairying, copper, petroleum; p. (1960) *133,929.*

Friedrichshafen, *t., L. pt.,* Germany; on L. Constance; machin., boat bldg., motors; p. (1963) *39,300.*

Friedrichsthal, *t.,* Saar; coal-mining, steel wks.; p. (estd. 1954) *16,400.*

Friendly Is. (Tonga), Pac. Oc.; 400 miles S.E. Fiji; independent Polynesian kingdom under Brit. protection; mild and healthy climate; ch. I., Tongatapu; cap. Nukualofa in Tongatapu; copra, bananas; a. 270 sq. m.; p. (estd.) *71,000*

Friern Barnet, *former urb. dist.,* Middx., Eng.; now inc. in Barnet outer bor., Greater London (*q.v.*); residtl.; p. (1961) *28,813.*

Friesland, *prov.,* Netherlands; cap. Leeuwarden; dairying, horses, cattle; natural gas on Ameland I.; a. 1,325 sq. m.; p. (1967) *506,311.*

Frimley and Camberley, *urb. dist.,* Surrey, Eng.; 3 m. N. of Farnborough (Hants); light engin., plastics; p. (1961) *30,342.*

Frinton and Walton, *urb. dist.,* Essex, Eng.; on E. cst., 5 m. N.E. of Clacton; seaside resort; p. (1961) *9,576.*

Friol, *commune,* Lugo, N.W. Spain; leather, linen; p. *10,667.*

Frisches Haff, *shallow freshwater lagoon,* Baltic cst. of Poland; 53 m. long, 4–11 m. broad.

Frische Nehrung, *sandspit,* G. of Gdansk, Baltic Sea; astride bdy. between Poland, U.S.S.R.; almost separates Frisches Haff (Zalew Wislany) from G. of Gdansk; length 36 m.

Frisian Islands, *chain of Is.* stretching from Zuyder Zee and N. to Jutland, along the csts. of the Netherlands and N. Germany; ch. Is. are Texel, Vlieland and Ameland.

Friuli-Venezia Giulia, *aut. reg.* (created 1963), N.E. Italy; comprising 3 provs. Udine (p. *800,000*), Gorizia (p. *140,000*), and Trieste (p. *300,000*); cap. Trieste.

Frobisher Bay, *inlet* in S. Baffin I., N. Canada, extending 200 m. between Cumberland Sound and Hudson Strait.

Frodingham, *t.,* Lincoln, Eng.; on W. flank of limestone ridge, Lincoln Edge; impt. iron-ore open-cast mines; mnfs. iron and steel; p. (1961) *67,257* (with Scunthorpe).

Frodsham, *mkt. t.,* Cheshire, Eng.; 10 m. N.E. Chester; chemicals.

Frome, *mkt. t., urb. dist.,* Somerset, Eng.; on R. Frome, 11 m. S. of Bath; woollens, printing, brewing, iron, metal and plastic wks.; p. (1961) *11,440.*

Frontignan, *t.,* Herault, S. France; oil refining; oil pipeline under sea from Sète.

Frosinone, *indust. t.,* Lazio, Italy; on R. Cosa; p. (1961) *30,796.*

Froward, *C.,* Magallanes prov., Southern Chile.

Frunze, *cap.,* Kirgiz S.S.R.; univ.; meat packing, engin., textiles; p. (1962) *312,000.*

Fthiotis and Focis, *pref.,* Greece; cap. Lamia; p. (1951) *199,794.*

Fucino, *L.* (*now drained*), Aquila, Central Italy; old volcanic crater. [(1957) *10,027.*

Fuente de Cantos, *indust. t.,* Badajoz, Spain; p.

Fuente-Ovejuna, *t.,* Cordoba, Spain; ctr. of lead-mining dist., honey prod.; p. (1957) *17,000.*

Fuerteventura, *I.,* Canary gr.; a. 663 sq. m.; p. (1962) *18,333.*

Fujiyama, extinct volcano, Japan, 60 m. S.W. of Tokyo; pilgrim resort; alt. 12,395 ft.

Fukien (Fujian) *prov.,* China; cap. Foochow (Fuzhou); tea, rice, cotton, sugar, tobacco; paper, coal, gold, silver; a. 45,845 sq. m.; p. (1953) *13,142,721.* [*169,636.*

Fukui, *t.,* Honshu, Japan; silk, paper; p. (1965)

Fukuoka, *t.,* Kyushu, Japan; comm. ctr.; silk, fabrics, dolls; p. (1965) *749,808.*

Fukushima, *c.,* N. Japan; chemicals, coal, iron prod.; pears, cherries; p. (1965) *173,678.*

Fukuyama, *t.,* S. Hokkaido, Japan; p. (1964) *161,000.*

Fulda, *c.,* Hessen, Germany; nr. Cassel; on R. Fulda; palace, abbey; textiles, metallurgy, rubber; route ctr.; p. (1963) *44,900.*

Fulda, *R.,* Central Germany; with the Werra forms the R. Weser.

Fulham, *see* Hammersmith.

Fullerton, *t.,* Cal., U.S.A.; p. (1950) *56,180.*

Fulton, *t.,* Mo., U.S.A.; firebrick and shoe factories; p. (1960) *11,131.*

Fulton, *c.,* N.Y., U.S.A.; woollens, cutlery, paper; p. (1960) *14,261.*

Fulwood, *urb. dist.,* Lancs, Eng.; 2 m. N.E. of Preston; p. (1961) *15,966.*

Funchal, *t., spt., cap.,* Madeira; winter resort; wine; p. (1960) *43,301.*

Fundy, Bay of, *inlet* between Nova Scotia and New Brunswick, Canada.

Furneaux, *Is.,* gr. in Bass Strait, belonging to Tasmania.

Furness, *dist.,* N.W. Lancs, Eng.; between Morecambe Bay and the Irish Sea; haematite iron ore.

Fürstenwalde, *indust. t.,* Frankfurt, E. Germany; on R. Spree; metallurgy, leather; p. (1963) *31,881.*

Fürth, *t.,* Bavaria, Germany; nr. Nürnberg; furniture mftg., toys, metallurgy, glass, paper, radio, footwear; p. (1963) *98,300.*

Fusan, *see* Pusan.

Fushiki, *t., spt.,* Honshu, Japan; on Toyama Bay to E. of Noto Peninsula; lge. coastwise tr. in rice from Koga and Toyama plains; exp. chemicals, lumber, metals; imports metals, coal, bean-cake, flax.

Fushun, *c.,* Liaoning, N. China; at foot of Changpai Shan, 22 m. S.E. of Mukden; most impt. coal-mines in Far East; possesses world's thickest bituminous coal seam (417 ft.) worked by deep and open-cast mines; p. (1953) *679,000.*

Fushimi, *c.,* Honshu, Japan; sub. of Kyoto; p. *29,700.*

Fusin (Fuxin), *c.,* Liaoning prov., China; coal mng.; agr.; p. (1953) *105, 000.*

Futa, La, *pass,* Tusco-Emilian Apennines, N. Italy; used by main road from Bologna to Florence; alt. 2,962 ft.

Futa Jalon, *upland dist.,* mostly in Guinea, W. Africa, with outliers in Liberia and Sierra Leone.

Futuna and Alofi, *Is.,* S. of Wallis Is., dependency of Fr. col. of New Caledonia; p. about *2,000.*

Fylde, *rural dist., geographical sub-region,* W. Lancs., Eng.; extends along W. cst. between estuaries of Ribble and Wyre; low, flat plain behind coastal sand dunes, covered by fertile glacial deposits; cultivated where drained, grain, vegetables; impt. pig and poultry rearing dist.; ch. t., Blackpool, famous holiday resort; p. (rural dist., 1961) *16,928.*

Fylingdales, ballistic missile early warning station on Yorkshire moors.

Fyn, *I.,* Denmark; in the Baltic Sea; a. 1,320 sq. m.; cap. Odense; p. (1960) *376,872.*

Fyne, *loch* on Argyll cst. W. Scot.; an arm of F. of Clyde; length 40 m.

Fyzabad, *t.,* Uttar Pradesh, India; sugar; p. (1961) *88 296.*

G

Gabes, *spt.,* Tunisia; on G. of Gabes, 200 m. S. of Tunis; dates, henna, wool; p. (1961) *24,400.*

Gaberones, *cap.,* Botswana, S.W. Africa; cattle, sorghum, maize; manganese mng.; p. (estd. 1965) *12,000.*

Gabon, *ind. sovereign st.,* within Fr. Community, Equatorial Africa; cap. Libreville; ivory, ebony, palm-oil; a. 103,000 sq. m.; p. (estd. 1965) *458,000.*

Gadag-Betgeri, *t.,* Mysore, India; cotton and silk weaving; p. (1961) *76,614.*

Gadsen, *indust., c.,* Ala., U.S.A.; cotton, cars, coal, iron, steel; p. (1960) *58,088.*

Gaeta, *spt., fort,* Caserta, Italy; 40 m. N.W. of Naples; the ancient Caietae Portus; cath.; p. *22,882.*

Gaffney, *t.,* S.C., U.S.A.; limestone, textiles; p. (1960) *10,435.*

Gafsa, *t.,* Tunisia; phosphates; p. (1961) *24,300.*

Gagny, *commune,* Seine-et-Oise, France; light inds.; p. (1954) *17,255.*

Gaillac, *t.,* Tarn, France; wines; p. (1954) *8,356.*

Gaillard Cut, *excavated channel,* Panama Canal Zone; carries Panama Canal through Culebra Mtn. from L. Gatun to Pac. Oc.; length 7 m.

Gainesville, *t.,* Fla., U.S.A.; p. (1960) *29,701.*

Gainesville, *t.,* Ga., U.S.A.; p. (1960) *16,523.*

Gainesville, *t.,* Texas, U.S.A.; p. (1960) *13,093.*

Gainsborough, *mkt. t., urb. dist.*, Lincs., Eng.; on R. Trent, 15 m. N.W. of Lincoln; shipping, agr. implements, engin., milling, malting, timber; p. (1961) *17,276*.

Gairdner, *L.*, S. Australia; 130 m. long, 23 m. broad.

Galápagos, *volcanic Is.*, Pac. Oc.; 600 m. W. Ecuador; consists of 12 lge. and several 100 sm. Is.; only 5 inhabited; administered by Ecuador; peculiar fauna and flora; guano; a. 2,868 sq. m.; p. (1962) *2,412*.

Galashiels, *burgh*, Selkirk, Scot.; on Gala Water, 2 m. above confluence with R. Tweed; tweeds, woollens; p. (1961) *12,374*.

Galati, *Black Sea pt.*, Romania, on Danube R.; naval base; engin., steel; p. (1968) *111,906*.

Galatina, *t.*, Apulia, Italy; p. *20,300*.

Galena, *t.*, Ill., U.S.A.; lead, zinc, marble, granite; p. (1960) *4,410*.

Galesburg, *t.*, Ill., U.S.A.; engin.; p. (1960) *37,243*.

Galicia, *former Austrian prov.*, Polish 1918–39, since 1939 E. part transferred to Ukrainian S.S.R. and W. remaining Polish (provs. Kraków and Rzeszów).

Galicia, *old prov.*, N.W. Spain; now forming provs. of La Coruña, Lugo, Orense and Pontevedra; mountainous; dairying; mining, lead, copper, iron; p. (1957) *2,600,000*.

Galilee, *N. div.* of Palestine in Roman period, containing Capernaum, Nazareth.

Galilee, Sea of (Lake Tiberias), also known as L. Gennesaret; 13 m. l., 6 m. wide, 150 ft. deep, 680 ft. below level of Med.; Israel plans to draw water from L. to irrigate Negev.

Galion, *t.*, Ohio, U.S.A.; mftg.; rly. ctr.; p. (1960) *12,650*.

Galla and Sidamo, *prov.*, Ethiopia.

Galle, *spt.*, Ceylon; on S.W. cst.; extensive tr. in tea, coconut oil; p. (1963) *64 942*.

Galleana, *mkt. t.*, Leon Prov., Mexico; at foot of Sierra Madre Oriental, 120 m. S. of Monterrey; focus of tr. between tropical lowlands and high plateau.

Gallego, *R.*, N.E. Spain; rises in Pyrenees, flows S. to R. Ebro at Zaragoza; R. provides water for irrigation around Zaragoza; valley used by main rly. across Pyrenees from Pau (France) to Zaragoza; length 110 m.

Gallegos, *t.*, *cap.*, Santa Cruz terr., Argentina; p. *7,003*.

Gallipoli, *spt.*, Italy; on E. shore G. of Taranto; p. *12,200*.

Gallipoli, *see* Gelibolu.

Gallipolis, *t.*, Ohio U.S.A.; p. (1950) *7 871*.

Gällivare, *dist.*, N. Sweden; inside Arctic Circle, 120 m. N.W. of Lulea; iron ore; p. *26,200*.

Galloway, *dist.*, S.W. Scot.; inc. the cos. of Wigtown and Kirkcudbright.

Galloway, Mull of, extreme S.W. point of Scot.

Gallup, *t.*, N.M., U.S.A.; coal, wool, sheep, cattle rearing; p. (1960) *14,089*.

Galston, *burgh*, Ayr, Scot.; on R. Irvine, nr. Kilmarnock; hosiery, lace; p. (1961) *4,023*.

Galt, *t.*, Ontario, Canada; mnfs.; p. (1961) *27,830*.

Galty Mtns., Tipperary, Ireland; alt. 3,000 ft.

Galveston, *c.*, *spt.*, Texas, U.S.A.; on I. in G. of Mexico; gr. cotton pt.; mills, foundries; p. (1960) *67,175*.

Galway *co.*, Galway Bay, Connacht, Ireland; fishery, cattle, marble quarrying; a. 2,452 sq. m.; p. (1961) *149,800*.

Galway, *t.*, *cap.*, Galway, Ireland; p. (1961) *21,989*.

Gambela, *tr. sta.*, leased to Sudan by Ethiopia.

Gambia, *indep. sov. st.* within Brit. Commonwealth (1965), W. Africa; narrow terr., average 20 m. wide, extends 200 m. inland astride R. Gambia; hot all year, summer rain; savannah grassland; ground-nuts, palm-kernals, bees-wax, hides; cap. Bathurst; a. 4,003 sq. m.; p. (estd. 1964) *315,999*.

Gambia, *R.*, Fr. W. Africa and Gambia, rises in Futa Jallon Plateau, flows N. and W. into Atl. Oc. at Bathurst; forms main means of communication through Gambia.

Gander, *airport*, Newfoundland, Canada; p. (1961) *5,725*.

Gandhinagar, *new cap.*, Gujarat, India; on Sabarmati R. 13 m. N. of Ahmedabad; under construction; planned initial p. *75,000* rising to *200,000*.

Gandia, *t. spt.*, Valencia, Spain; fruit exp.; silk spinning p. (1957) *20,160*.

Ganges (Ganga), *gr. sacred R.*, India; rises in Himalayas and flows to Bay of Bengal, by several delta mouths, on one of which stands Calcutta. Delta very fertile and densely populated. Navigable for lge. ships from Allahabad; length 1,500 m.

Gangtok, *t.*, cap. Sikkim, E. Himalayas; trade ctr., carpets; p. (1965) *12,000*.

Ganjam, *dist.*, Orissa, India; a. 4,824 sq. m.; p. (1961) *1,872,530*.

Gap, *c.*, Hautes Alpes, S.E. France; silk and other textiles; p (1954) *12,317*.

Gard, *Mediterranean dep.*, France; cap., Nimes; vines, olives, sericulture; a. 2,270 sq. m.; p. (1962) *435,482*.

Garda, *L.*, between Lombardy and Venezia, Italy; a. 143 sq. m.; greatest depth, 1,135 ft.

Garden City, *t.*, Mich., U.S.A.; p. (1960) *38,017*.

Garden City, *t.*, N.Y., U.S.A.; p. (1960) *23,948*.

Garden Grove, *t.*, Cal., U.S.A.; p. (1960) *84,238*.

Gardena, *t.*, S.W. Cal., U.S.A.; mkt.-gardening; p. (1960) *35,943*.

Gardiner, *t.*, Me., U.S.A.; p. (1960) *6,897*.

Gardner, *t.*, Mass., U.S.A.; chair mftg.; p. (1960) *19,038*.

Garfield, *t.*, N.J., U.S.A., p. (1960) *29,253*.

Garfield Heights, *t.*, Ohio, U.S.A.; iron, steel, oil refineries, abrasives; p. (1960) *38,455*.

Garforth, *urb. dist.*, W.R. Yorks, Eng.; p. (1961) *14,641*

Garigliano, Italy; nuclear power plant projected.

Garland, *t.*, Texas, U.S.A.; p. *38,501*.

Garmisch-Partenkirchen, *t.*, Bavaria, Germany; winter sports; p. (1963) *26,600*.

Garo Hills, *mountainous dist.*, Assam, India; a. 3,119 sq. m.; dense forests; p. (1961) *307,228*.

Garonne, *R.*, S.W. France; rises at foot of Mt. Maladetta (Pyrenees), and enters the Gironde estuary 20 m. below Bordeaux; length 350 m.

Garonne, Haute, *dep.*, S. France; a. 2,458 sq. m.; p. (1962) *594,633*.

Garrigue, *region*, Languedoc, S. France; low limestone hills, run N.E. to S.W., W of Rhône delta; semi-arid; scanty vegetation; winter pasture for sheep, olives; Montpellier, Nimes located on S. flank.

Garston, *spt.*, southern end Bootle and Liverpool docks; Lancs, Eng.; docks; p. *28,000*.

Garut, *t.*, W. Java, Indonesia; mtn. resort; p. *24,219*.

Gary, *c.*, Ind., U.S.A.; at S. end of L. Michigan; steel, tin-plate, cement, soap, chemicals, oil refining; p. (1960) *178,321*.

Gascony, *ancient prov.*, *duchy*, S.W. France.

Gaspé, *peninsula*, Quebec, Canada; on S. side of St. Lawrence.

Gastein, *t.*, Salzburg, Austria; mineral springs.

Gastonia, *c.*, N.C., U.S.A.; p. (1960) *37,276*.

Gateshead, *t.*, *co. bor.*, Durham, Eng.; on R. Tyne, opposite Newcastle; engin.; p. (1961) *103,232*.

Gatineau, *R.*, Canada; trib. of Ottawa R., which it joins nr. Ottawa; length 300 m.

Gatooma, *t.*, Rhodesia; farming, mining and cotton mnfs., gold, mineral deposits; p. (1958) *10,000* (incl. *2,000* Europeans).

Gatun, *artificial L.*, Panama Canal Zone, Central America; passed through by Panama Canal; alt. 40 ft. above Caribbean Sea; a. 250 sq. m.

Gatwick, Surrey–Sussex border; 25 m. S. London; 1st airport in world where trunk road, main rly. line and air facilities combined in one unit.

Gauhati, *t.*, Assam, India; univ.; silk, cotton, lace, oil refinery; oil pipeline from Baraunl; p. (1961) *100,702*.

Gauri-Sankar, *mtn.* in Himalayas; 35 m. W. of Mt. Everest; alt. 23,440 ft.

Gävle, *spt.*, Sweden; timber, textiles, steel, porcelain; p. (1961) *54,768*.

Gävleborg, *co.*, Sweden; ch. t., Gävle; a. 7,610 sq. m.; p. (1961) *293,070*.

Gaya, *t.*, Bihar, India; famous Buddhist pilgrim ctr.; cottons, silks; p. (1961) *151,105*.

Gayyarah, Mosul, Iraq; bitumen refinery

Gaza, *spt.*, U.A.R.; exp. cereals, wool; p. *c. 100,000*.

Gaza Strip, *cstl. a.* under Egyptian admin. since 1949; occupied by Israeli troops, Nov. 1956–March 1957, and since June 1967.

Gaziantep, *t.*, Turkey; S.W. of Malatya; p. (1965) *158,367*.

Gazli, Uzbekistan S.S.R.; 60 m. N.W. of Bukhara; natural gas field discovered mid-1950's; pipeline to Chelyabinsk opened Nov. 1963.

Gdansk *prov.* (*voivodship*), Poland; ch. t. Gdansk (Danzig); a. 4,290 sq. m.; p. (1965) *1,353,000*.

Gdansk (Danzig), *spt.*, Poland; on R. Vistula; impt. Baltic pt.; Prussian, 1814–1919; free city

under Treaty of Versailles; annexed to Germany, 1939; restored to Poland, 1945; industr. and comm. ctr.; shipbldg., machin., chemicals, metals; p. (1965) *319,000*.

Gdynia, *spt.*, Poland; built by Poland as pt. after 1924 when Danzig was a free city; impt. comm. pt.; rly. ctr.; metal, machin., food inds.; p. (1965) *165,000*.

Géant, Aiguille du, *mtn.* in Savoy Alps, France; alt. 13,170 ft.; nearby Col du Géant, pass from Chamonix to Italy, alt. 11,145 ft.

Geel, *t.*, Belgium; 30 m. E. of Antwerp; nuclear power plant projected.

Geelong, *spt.*, Port Phillip, Victoria, Australia; fine harbour; tr. in flour, wool; oil refining; aluminium; p. (1961) *91,666*. [25,800.

Geislingen, *t.*, Wurttemberg, Germany; p. (1963)

Gela, *t.*, S. Sicily, Italy; in cotton growing a.; petro chemicals; p. (1961) *54,774*.

Gelderland, *prov.*, Netherlands; E. and S. of Utrecht prov., a. 1,939 sq. m.; cap. Arnhem; cereals, tobacco; cattle rearing; p. (1967) *1,434,439*.

Gelibolu, (Gallipoli), *t.* and *peninsula* on the Dardanelles, Turkey; vines, sericulture; scene of unsuccessful landing by British and Anzac troops 1915; p. (1960) *12,956*.

George, *t.*, Cape Province, S. Africa; footwear, sawmilling, hops; p. (1960) *14,505* inc. *8,635* whites.

Georgetown, *cap.*, Guyana, S. America; on Demerara R.; exp. sugar, cocoa, coffee, timber, gold, diamonds, bauxite; p. (1962) *98,350*.

Georgetown, *t.*, S.C., U.S.A.; fish, lumber, cotton; p. (1960) *12,261*.

Georgetown, *t.*, Washington D.C., U.S.A.; on R. Potomac; univ., cath.

Georgetown, *c.*, *spt.*, Penang, Malaya; p. *189,068*.

Georgia, *st.*, U.S.A.; on Atlantic cst.; forested, agr.: cotton, tobacco, corn, peanuts, fruit; textiles, lumber, chemicals, steel; chief ts.; Atlanta (cap.) and Savannah; a. 58,876 sq. m.; p. (1960) *3,943,116*.

Georgia, *constituent rep.*, U.S.S.R.; maize, tobacco, wheat; engin., metallurgy, manganese mng., oil, gold deposit discovered nr. R. Inguri in a. of new h.e.p. project 1965; cap. Tbilisi; a. 37,570 sq. m.; p. (1959) *4,049,000*.

Georgian Bay, *lge. inlet*, Ontario, Canada; E. shore of L. Huron; many impt. lake pts. (Owen Sound, Parry Sound) where Prairie wheat is transhipped to rly. for despatch to Montreal; a. approx. 4,500 sq. m.

Gera, *t.*, Gera, E. Germany; lignite, woollens, printing; p. (1963) *104,198*.

Geraldton, *spt.*, W. Australia; 306 m. from Perth; in agr. and pastoral dist.; exp. gold, copper, wool; natural gas nearby; p. (1961) *10,878*.

Germany, after defeat in Second World War divided into E. and W. Germany. W. Germany is Federal st. (declared sovereign May 5, 1955) of 9 Länder, Schleswig-Holstein, Hamburg, Lower Saxony, Bremen, North Rhine-Westphalia, Hesse, Rhineland, Palatinate, Baden-Württemberg, and Bavaria. Previously divided into British, American, and French zones; a. 94,716 sq. m.; admin. ctr. Bonn; Saar incorporated, 1956; a. 991 sq. m.; p. (1963) *58,587,500* inc. Saar, and W. Berlin; E. Germany comprises 14 dists., Rostock, Schwerin, Neubrandenburg, Magdeburg, Potsdam, Frankfurt, Erfurt, Halle, Leipzig, Cottbus, Suhl, Gera, Karl-Marx-Stadt, Dresden. Previously the Soviet zone, became sovereign st., March 25, 1954; a. 41,571 sq. m.; p. (1964) *17,011,931*. Berlin under four-Power control; ch. German inds.: agr.: rye, oats, wheat, potatoes, sugar-beet, wines; pastoral; cattle, pigs, sheep; forests, timber; minerals; coal, lignite, iron, potash, copper, zinc, salt; mnfs., machine., shpbldg., textiles, chemicals, dyes, printing, etc.; commerce; communications very good.

Germiston, *t.*, Transvaal, S. Africa; nr. Johannesburg; gold mng.; rly. wkshps., engin., machin., chemicals; gas pipeline from Sasolburg, O.F.S.; p. (1960) *204,605* (inc. *84,419* Whites).

Gerona, *maritime prov.*, N.E. Spain; cap. G.; textiles, coal, paper; a. 2,264 sq. m.; p. (1959) *345,320*.

Gerona, *mun.*, Luzon, Philippine Is.; rice, sugar, pineapples; p. *20,892*.

Gerrards Cross, *t.*, S.E. Bucks, Eng.; 9 m. E. of High Wycombe; residtl.; p. (1951) *2,942*.

Gers, *dep.*, S.W. France; cap. Auch; grain, vines, brandy; a. 2,429 sq. m.; p. (1962) *182,264*.

Gers, *R.*, rising in the Pyrenees, flows to the Garonne; length 75 m.

Gettysburg, *t.*, Penns., U.S.A.; Federal victory 1863; granite; p. (1960) *7,960*.

Gevelsberg, *c.*, Westphalia, Germany; iron stoves; p. (1963) *32,100*.

Geyser Springs, *summer resort* Cal., U.S.A.; 90 m. N.W. of San Francisco.

Gezira, *dist.*, Sudan, N.E. Africa; situated between Blue and White Niles above confluence at Khartoum; approx 4,700 sq. m. capable of irrigation by water drawn from Blue Nile at Sennar Dam; large-scale growing of high-quality cotton; total a. approx. 7,800 sq. m.

Ghadames, *oasis*, Sahara Desert, Libya; N. Africa; at point where terr. of Tunis, Algeria, Libya converge 300 m. S.W. of Tripoli; impt. focus of caravan routes.

Ghaghara (Gogra), *sacred R.*, India; rising in Tibet, flows through Uttar Pradesh; trib. of Ganges; length 300 m.

Ghana, Rep. of, W. Africa; sovereign and ind. st. within British Commonwealth since 6 March 1957; agr.; cocoa, palm-oil, groundnuts; mahogany, manganese, gold, diamonds; cap. Accra; harbours at Takoradi and Tema; total a. 91,843 sq. m.; p. (1965) *7,600,000*.

Ghardaia, *t.*, S. Algeria; p. (1960) *58,327*.

Ghats, E. and W., *two mtn. ranges* bordering the triangular upland of S. India, the Deccan; alt. of ch. summits, 4,700–7,000 ft.

Ghazipur, *t.*, N. India; on Ganges R., E. of Varanasi; agr. school; p. (1961) *37,147*.

Ghazni, *fortfd. mtn. t.*, Afghanistan; 78 m. S.W. of Kabul; gr. tr. ctr.; cap. of the Empire of Mahmud, c. A.D. 1000; p. *10,500*.

Ghazvin, *c.* and *dist.*, Central Prov., Iran; agr.; irrigation plant.

Ghent, *c.*, Belgium; cap. of E. Flanders, on R. Scheldt; cath. univ.; extensive cotton, woollen, sugar inds.; plastics, photographic materials; p. (1962) *156,499*.

Giant's Causeway, *famous basaltic columns*, on promontory of N. cst. of Antrim, Ireland.

Giarre, *t.*, Sicily, Italy; nr. Mt. Etna; industl.; p. *20,050*.

Gibara, *t.*, Oriente prov., Cuba, W. Indies; exp. bananas; p. *8,045*.

Gibraltar, *Brit. fortress and naval base* of gr. strategic importance, W. end of Mediterranean; on rocky peninsula (1,396 ft.), extreme S. of Spain; captured by British in 1704; a. 2¼ sq. m.; civilian p. (estd. 1965) *24,386*.

Gibraltar, Strait of, connects Atlantic and Mediterranean; its narrowest breadth is 9 m.

Gibson Desert, centre of W. Australia.

Giessen, *t.*, Hesse, Germany; on R. Lahn; univ.; tobacco, engin., textiles; p. (1963) *69,800*.

Gifu, *t.*, Central Honshu, Japan; silk; paper; cormorant fishing; p. (1965) *358,190*.
Gigha, *I.*, Argyll, Scot.; off W. cst.; 6 m. long, 2 m. wide; p. (with Cara) *243*.
Gijón, *spt.*, Oviedo, Spain; on Bay of Biscay; fine harbour; tobacco, petroleum, coal, earthenware; p. (1959) *121,692*.
Gila, *R.*, New Mexico and Arizona, U.S.A.; trib. of Rio Colorado; water used for irrigation in Imperial Valley; length 650 m.
Gilan, *prov.*, N.W. Iran, on Caspian Sea, bounded by U.S.S.R.; sub-tropical climate; agr., inc. cotton and rice; cap. Rasht; p. (1967) *1,754,650*.
Gilbert and Ellice Islands Colony, *gr. of coral Is.* (Brit.), Micronesia, Pac. Oc.; ch. crops: pandanas fruit and coconuts; exp. phosphates and copra; a. 369 sq. m.; p. (estd.) *50,000*.
Gilgit, *cap.*, G. extreme N.W. dist. of Kashmir.
Gilgit, *R.*, of the Punjab rising in Chitral, trib. of the Indus, flowing along the Gilgit valley into Kashmir.
Gill, Lough, *L.*, on borders of cos. Sligo and Leitrim, Ireland.
Gillespie, *t.*, Ill., U.S.A.; coal; p. (1960) *3,569*.
Gillingham, *t.*, *mun. bor.*, Kent, Eng.; 2 m. E. of Chatham; cherry orchards, cement, light inds.; p. (1961) *72,611*.
Gilly, *t.*, Hainaut, Belgium, nr. Charleroi; coal; p. (1962) *23,878*.
Gilolo I., *see* **Halmahera I.**
Gilp Loch, Argyll, Scot.; inlet of Loch Fyne, at head of Crinan Canal.
Gioja del Colle, *c.*, Bari, S. Italy; olive oil, wine, wool; p. *24,000*.
Giovinazzo, *spt.*, S. Italy; on the Adriatic, N. of Bari; p. *12,150*.
Gippsland, *dist.*, S.E. Victoria, Australia; a. 13,900 sq. m.; mntous.; farming, grazing; coal.
Girardot, *t.*, Colombia, S. America; impt. R. pt. and airport on upper course of R. Magdalena, 685 m. upstream from Caribbean Sea; linked by rly. (70 m.) to Bogotá; coffee, hides, ceramics; p. (estd. 1959) *50,000*.
Giresun, *spt.*, Black Sea, Turkey, W. of Trabzon; p. (1960) *19,946*.
Girga, *t.*, Upper U.A.R.; on R. Nile; p. *1,000*.
Girga, *admin. div.*, Upper U.A.R., N.E. Africa; a. 595 sq. m.; p. (1960) *1,574,000*.
Girgenti, (same as **Agrigento**, *q.v.*), *t.*, S. Sicily, Italy; famous for its Greek temples.
Girishk, *t.*, Afghanistan; on Helmand R.; ctr. of agr. dist.
Gironde, *dep.*, France; vineyards, grain, fruit, wines; cap. Bordeaux; a. 4,140 sq. m.; p. (1962) *935,448*.
Gironde, *R.*, *estuary*, S.W. France; formed by junction of Rs. Garonne and Dordogne; navigable to Pauillac.
Girton *par.*, nr. Cambridge, Eng.; women's college.
Girvan, *burgh*, Ayr, Scot.; on F. of Clyde, 18 m. S.W. of Ayr; summer resort; p. (1961) *6,159*.
Gisborne, *spt.*, N.I., N.Z.; on Poverty Bay, 60 m. N.E. of Napier; freezing-wks.; p. (1961) *25,064*.
Gisburn, *t.*, W.R. Yorks; on R. Ribble, nr. Clitheroe.
Giugliano, *t.*, Italy; N.W. of Naples; mnfs.; p. *20,500*.
Giulianova, *t.*, Teramo, Italy; fruit, grain; p. *20,000*.
Giurgiu, *pt.*, Romania; on R. Danube; opposite Ruse; good tr.; timber; p. (1963) *51,520*.
Givet, *t.*, Ardennes, N.E. France; on R. Meuse; tanneries; p. *6,000*.
Givors, *t.*, Rhône dep., France; on Rhône R., 10 m. S. of Lyons; mnfs.; oil refining nearby at Feyzin; p. (1954) *14,242*.
Giza, *admin div.*, U.A.R.; cap. Giza; a. 392 sq. m.; p. (1960) *1,337,000*.
Giza, *t.*, Lower U.A.R.; on the Nile, 3 m. S.W. of Cairo; nr. pyramids of Khafra (Chephren), Khufu (Cheops) and Men-ka-va; also the Sphinx; contains Museum of Egyptian antiquities; film ind.; p. (1960) *250,000*.
Gjinokastër (Argyrocastro), *prefecture*, Albania; cap. G.; p. (estd.) *159,695*.
Gjövik, *t.*, S. Norway; on L. Mjosa; furniture, footwear, light inds.; p. (1961) *7,738*.
Gjuhëzës, C. (Glossa C.), Albania, Strait of Otranto.
Glace Bay, *t.*, Nova Scotia, Canada; coal; p. (1961) *24,186*.

Grays Thurrock, *urb. dist.*, Essex, Eng.; on the

Thames, nr. Tilbury Fort; oil refining, metal refining, cement, paper board, margarine, soap mftg.; p. (1961) *114,263*.
Graz, *t.*, Austria; on R. Mur; machin., iron and steel, rly. wks.; p. (1963) *244,000*.
Great Altai, *range of mtns.*, lying mainly in outer Mongolia but also in Western Siberia.
Great Atlas, *mtns.*, N.W. Africa; alt. 7,000 ft.
Great Australian Basin, *artesian basin*, Australia; underlies plains of S.W. Queensland, N.W. New South Wales, N.E. of S. Australia; water supply used on sheep-farms, cattle-ranches, in a. from Normanton in N. to Renmark in S., Oodnadatta in W. to Roma in E.; a. 570,000 sq. m.
Great Australian Bight, *wide inlet*, S. of Australia, between C. Arid and Port Whidbey; 850 m.
Great Barrier Reef, *coral reef barrier*, off N.E. cst. of Australia; 1,000 m. long, 75–100 m. from cst.
Great Basin, *high plateau region* between the Wasatch and Sierra Nevada Mtns., U.S.A., inc. most of Nev., parts of Utah, Cal., Idaho, Ore., Wyo.; inland drainage ctr. Great Salt Lake; a. 210,000 sq. m.; much desert; sparse p.
Great Bear Lake, on the Arctic Circle, in N.W. Terr., Canada, over 150 m. long; a. 14,000 sq. m.; outlet through Great Bear R. to Mackenzie R.
Great Belt, *strait*, separating I. of Fyn from Sjaelland, Denmark.
Great Britain, *see* **England, Scotland, Wales, British Isles.**
Great Dividing Range, *mtn. system*, E. Australia; extends, under different local names, from Queensland to Victoria and separates E. cst. plains from interior; reaches max. alt. in Mt. Koskiusko (7,328 ft.), in Australian Alps, on bdy. between Victoria and New South Wales.
Great Falls, *t.*, Mont., U.S.A.; on Missouri R.; wool; gold, silver; lead and copper smelting; p. (1960) *55,357*.
Great Fish R., Cape Province, S. Africa.
Great Fisher Bank, *submarine sandbank* in N. Sea; 200 m. E. of Aberdeen, 100 m. S.W. of Stavanger; valuable fishing-ground; depth of water, from 25 to 40 fathoms.
Great Gable, *mtn.*, Cumberland, Eng.; alt. 2,949 ft.
Great Harwood, *t.*, *urb. dist.*, Lancs, Eng.; 5 m. N.E. of Blackburn; cotton weaving, textiles, engin.; p. (1961) *10,718*.
Great Karroo, Cape Province, S. Africa; high plateau; ostrich farming.
Great Lakes, N. America; comprising 5 fresh-water Ls.: Superior, Michigan, Huron, Erie, Ontario; frozen 4 to 5 months in winter; enormous L. traffic in cereals, iron, coal, etc.; a. 96,000 sq. m. *See* **St. Lawrence Seaway.**
Great Makarikari, Botswana, South Africa; salt pan.
Great Namaqualand, S. region of S.W. Africa.
Great Ormes Head, *promontory*, N. Wales; nr. Llandudno.
Great Plains, *lowland area* of central N. America, extending E. from Rocky Mtns. and S. from Mackenzie to S. Texas.
Great Rift Valley, geological fault extending from S.W. Asia to E. Africa, 3,000 m. in length; includes L. Tiberias, Jordan Valley, Dead Sea, Gulf of Aqaba, Red Sea, and chain of Ls. from Rudolf to Nyasa; a branch runs through Ls. Tanganyika, Edward and Albert.
Great St. Bernard, *pass*, Switzerland. *See* **K146.**
Great Salt Lake, Utah, U.S.A.; in the Great Basin plateau of N. America; 90 m. long; a. over 2,000 sq. m.; alt. 4,218 ft.; receives Bear, Jordan and Beaver Rs.; no outlet.
Great Sandy Desert, N. part, W. Australia.
Great Slave Lake, N.W. Terr., Canada; length 300 m.; greatest breadth 50 m., outlet Mackenzie R.
Great Slave R., Canada, flowing between L. Athabaska and the Great Slave L.
Great Smoky Mtns., Tenn., U.S.A.; with Blue Ridge Mtns. form E. Zone of Appalachian Mtn. system; rise to alt. over 6,000 ft.; largely preserved as National Park.
Great Victoria Desert, W. and S. Australia, lies north of Nullarbor Plain.
Greater Antilles Is., W. Indies.
Greece, *kingdom*, S. part of Balkan Peninsula, bounded on N. by Albania, Jugoslavia and Bulgaria, on W. and S. by the Mediterranean, and on the E. by the Ægean Sea, and inc. Is. in the Mediterranean, Ægean and Ionian Seas; cap. Athens; agr.: cereals, tobacco, currants, vines, fruit; sheep, goats, cattle; minerals: iron, lead, magnesite, lignite; mnfs.: olive oil, wine, textiles, chemicals, shipyds., oil refining; a. 51,182 sq. m.; p. (estd. 1965) *8,550,000*.
Greeley, *t.*, Col., U.S.A.; nr. Denver, site of st. college of education; lumber, flour; p. (1960) *26,314*.
Green Bay, *c.*, Wis., U.S.A.; tr. in timber, flour, etc., paper, coal; p. (1960) *62,888*.
Greenfield, *t.*, Mass., U.S.A.; p. (1960) *14,389*.
Greenhithe, Thames-side, nr. Dartford, Kent, Eng.
Greenland, *I.*, between Arctic Ocean and Baffin Bay; lofty ice-capped plateau; peopled by coastal settlements of Eskimos; whale oil, seal skins; some coal, lead, zinc; U.S. base at Thule; part of Danish kingdom; cap. Godthaab; a. 840,000 sq. m., of which 708,000 sq. m. are under a permanent ice-cap; p. (estd. 1965) *37,000*.
Greenlaw, *t.*, Berwick, Scot.
Green Mtns., Vermont section of Appalachian mtns.; highest peak, alt. 4,430 ft.
Greenock, *burgh*, Renfrew, Scot.; on S. shore of Firth of Clyde, 20 m. W. of Glasgow; shipbldg., sugar-refining, woollens, chemicals, aluminium casting, tin plate inds.; p. (1961) *74,578*.
Greenore, *cape*, Louth, Ireland; separating Dundalk Bay from Carlingford, Lough.
Green R., trib. of Grand R., Utah, U.S.A.; length 750 m.
Greensboro', *c.*, N.C., U.S.A.; cotton, tobacco; [p. (1960) *119,574*.
Greensburg, *t.*, Penns., U.S.A.; iron and glass factories; p. (1960) *17,383*.
Greenville, *t.*, Miss., U.S.A.; on Miss. R.; cotton tr.; p. (1960) *41,502*.
Greenville, *c.*, S.C., U.S.A.; in the cotton belt; p. (1960) *66,188*.
Greenville, Texas, U.S.A.; cotton, rayon, shipping; p. (1960) *19,087*.
Greenwich, *inner bor.*, London, Eng.; inc. most of former bor. of Woolwich on S. bank of R. Thames; famous for its Hospital, Observatory (now moved to Herstmonceux) and R.N. College; longitudes conventionally calculated Greenwich meridian either E. or W.; p. (1964) *230,082*.
Greenwood, *t.*, Miss., U.S.A.; p. (1960) *20,436*.
Greenwood, *t.*, S.C., U.S.A.; p. (1960) *16,644*.
Greifswald, *spt.*, Rostock, E. Germany; on Baltic inlet; shipbldg., textiles, wood inds.; p. (1963) *47,563*.
Greiz, *t.*, Gera, E. Germany; paper, textiles, chemicals; p. (1963) *38,470*.
Grenaa, *t.*, Randers, Jutland, Denmark; textiles, furniture, engin.; p. (1960) *9,088*.
Grenada, *I.*, *aut. st.* in association with Gt. Britain; W.I.; cap. St. George's; fruit, cocoa, spices a. (inc. the Grenadines) 133 sq. m.; p. (estd. 1967) *89,000*.
Grenadines, *Brit. gr. of sm. Is.*, between Grenada and St. Vincent, Windward Is.; sea-island cotton; p. (1960) *6,433*.
Grenoble, *fortfd. c.*, Isère, S.E. France; on R. Isère; 60 m. from Lyons; gloves, buttons, machin., liqueurs, cement; joint Franco-German nuclear research reactor; p. (1962) *162,764*.
Gretna, *t.*, La., U.S.A.; on the Mississippi R.; p. [(1960) *21,967*.
Gretna Green, *vil.*, Dumfriesshire, Scot., on Eng. border; famous as place of runaway marriages, 1754–1856.
Grey Range, *mtns.*, S.W. Queensland, Australia; extends S.W. from Gr. Dividing Range towards Flinders Range and Spencer G.; forms divide between streams draining E. to R. Darling and those draining W. to L. Eyre.
Greymouth, *spt.*, S.I., N.Z.; on W. cst. at mouth of Grey R.; ch. t. prov. of Westland; coal; p. (1961) *8,877*.
Greytown, *see* **San Juan del Norte.**
Griffin, *c.*, Ga., U.S.A.; cotton factories and tr.; p. (1960) *21,735*.
Grim, *C.*, N.W. Tasmania.
Grimaldi, *caves*, N.W. Italy; remains of prehistoric man, late Paleolithic, found there.
Grimsby, *spt.*, *co. bor.*, Lincoln, Eng.; on S. bank of R. Humber; fishing, shipbldg., fertilisers, chemicals, engin., paper mkg., tanning and cod liver oil, acrylic fibre; p. (1961) *96,665*.
Grimsel Pass, Bernese Alps, Switzerland; alt. 7,100 ft.
Grindelwald, *vil.*, Bernese Oberland, Switzerland; tourist ctr.
Griqualand East, *dist.*, Cape Province, S. Africa;

pastures, wool; ch. t. Kokstad; a. 6,602 sq. m.; p. *265,000*.
Griqualand W., *dist.*, Cape Province, S. Africa; diamonds; ch. t., Kimberley; a. 15,197 sq. m.; p. *160,793*. [French cst. to Dover.
Gris-Nez, *C.*, N.E. France; nearest point on
Grisons (Graubünden), *can.*, Switzerland; one-half only productive, many glaciers, contains the mtn. health resorts of Davos-Platz (alt. 5,115 ft.), St. Moritz (alt. 6,089 ft.), Arosa (alt. 6,108 ft.); a. 2,746 sq. m.; p. (1960) *145,600*.
Grivegnee, *t.*, Belgium; nr. Liége; ironwks.; p. (1962) *23,340*.
Grodno, *t.*, W. Byelorussia (Polish until 1939); agr.; engin., textiles, chemicals; p. (1959) *72,000*.
Grodzisk Mazowiecki, *commune*, Poland; 12 m. S.W. of Warsaw; p. *18,737*.
Gronau, *t.*, N. Rhine–Westphalia, Germany; nr. Dutch frontier; textiles, rly. junction; p. (1963) *26,000*.
Grong, *spt.*, Norway, on Falda Fjord; p. (1961) *2,052*.
Groningen, *c.*, cap. Groningen, Netherlands; comm. ctr.; univ.; woollens, glucose, shipbldg.; p. (1967) *156,208*.
Groningen, *prov.*, N.E. Netherlands; agr. and dairying; natural gas deposits at Slochteren; a. 883 sq m.; p. (1967) *508,173*.
Groote Eylandt, *I.*, G. of Carpentaria; off cst. of N. Terr., Australia.
Grootfontein, *t.*, S.W. Africa; copper- and lead-mining; world's lgst. known meteorite on nearby farm; p. (1960) *3,722* inc. *1,195* whites.
Grosseto, *prov.*, central Italy; ch. t. Grosseto, a. 1,735 sq. m.; p. (1963) *216,704*.
Grosseto, *t.*, *cap.* Grosseto prov., Central Italy; severely affected by heavy floods Nov. 1966; p. (1961) *51,004*.
Groton, *indust. t.*, Conn., U.S.A.; opp. New London at mouth of Thames R.; p. (1960) *10,111*.
Grottaglie, *t.*, Lecce, Apulia, Italy; nr. Brindisi; white glaze pottery; p. *14,850*.
Grove City, *bor.*, Penns., U.S.A.; engines, carriages; p. (1960) *8,368*.
Grozny, *t.*, N. Caucasia, R.S.F.S.R.; on R. Terek; naphtha wells, refinery, engin.; starting point of oil pipelines to Makhachkala Tuapse and Gorlovka; p. (1962) *280,000*.
Grudziadz (Graudenz), *t.*, on R. Vistula, Polish Pomerania; sawmilling; p. (1965) *71,000*.
Grünberg, *see* Zielona Gora.
Gruyère, *dist.*, can. Fribourg, Switzerland; cheese.
Gstaad, *fashionable summer and winter res.*, Bernese Oberland, Switzerland.
Guadalajara, *c.*, Mexico; cap. of Jalisco st.; cotton and wool mnfs.; cath.; gas pipe-line from Salamanca; p. (1960) *736,800*.
Guadalajara, *prov.*, Spain; agr. and salt mines; a. 4,709 sq. m.; p. (1959) *195,637*.
Guadalajara, *mftg. t.*, G. prov., Spain; woollens, leather; p. (1957) *15,700*.
Guadalaviar, *R.*, E. Spain; flows into Mediterranean, nr. Valencia; length 130 m.
Guadalcanal, *I.*, Brit. Solomon Is., Pac. Oc.
Guadalquivir, *R.*, Spain; flows through Andalusia to Atlantic; length 375 m.
Guadalupe Hidalgo, *t.*, Mexico; treaty signed 1848 ending Mexican–U.S. war; p. (estd.) *29,000*.
Guadeloupe and Dependencies, Leeward gr.; a. 722 sq. m.; sugar produce; ch. pt. Pointe à Pitre; p. (1961) *282,000*. French Overseas Dept.; Leeward gr. consists of Guadaloupe (p. *113,412*, ch. t. Basse-Terre), Grande Terre p. (*113,545*, ch. t. Pointe à Pitre); united a. of Is., 583 sq. m.; and 5 smaller Is., Marie Golante, Désirade, St. Barthelemy and St. Martin (total p. *304,000*) still inhabited by white descendants of French emigrants of 300 years ago; mountainous; rum, sugar, coffee, bananas.
Guadiana, *R.*, forms part of Spanish and Portuguese frontier; flows into Bay of Cadiz; length 510 m.; Extremadura valley reclamation scheme in progress.
Guadiana del Caudillo, *new t.*, nr. Badajoz, Spain; linen, hemp goods, cattle foods.
Guadix, *c.*, Granada, S. Spain; cath.; hats, hemp, brandy, pottery, mats, carpets; p. (1957) *30,088*.
Guaira, La, *spt.*, Venezuela; motor road to Carácas; exp. hides, cocoa, coffee; p. (1961) 20,275.
Gualdo Tadino, *commune*, central Italy; cath.; pottery; p. *12,791*.
Gualeguaychu, *t.*, Entre Rios, Argentina; cattle and agr. ctr.; p. (1960) *43,000*.
Guam, *I.*, most S. and lgst. of Marianas Archipelago, N. Pacific; naval sta. of the U.S.A.; Polaris submarine base at Apra harbour; ch. t. Agaña and spt. is Piti; maize, sweet potatoes, bananas; a. 209 sq. m.; p. (1960) *67,044*.
Guanabacoa, *indust. t.*, nr. Havana, Cuba; p. *21,999*.
Guanabara, *st.*, Brazil; formerly fed. dist. of Rio de Janeiro; *q.v.* [p. (1963) *141,523*.
Guanacasta, *prov.*, Costa Rica, Central America;
Guanajuato, *st.*, Central Mexico; very fertile, productive and prosperous; a. 11,804 sq. m.; p. (1960) *1,735,490*.
Guanajuato, *ch. t.*, G. st., Mexico; 250 m. from Mexico c.; cotton, silver, lead; p. (1960) *23,379*.
Guanta, *spt.*, Anzoategui st., Venezuela, S. America; on Caribbean Sea, linked by road to Barcelona (10 m.); exp. oil.
Guantanamo, *t.*, Cuba; sugar, coffee, bananas, cacao; p. (1953) *64,671*.
Guapore, *R.*, Brazil, S. America; joins the Mamore; length 900 m.
Guarda, *t.*, Portugal; alt. over 3,000 ft.; p. (1960) *9,094*.
Guarda, *wine-growing dist.*, Portugal; between Rs. Tagus and Douro; p. (1963) *279,100*.
Guardafui, *C.*, most E. point of Africa.
Guatemala, *republican st.*, Central America; adjoins Mexico, Br. Honduras and El Salvador, coffee, bananas, chicle; lead, zinc, and cadmium mined in sm. quantities; a. 45,452 sq. m.; p. (estd. 1965) *4,304,000*.
Guatemala City, *cap. c.*, Guatemala; cath.; univ.; minerals: gold, silver, copper, lead; p. (estd. (1965) *573,000*.
Guayaquil, *ch. pt.*, Ecuador, S. America; on Guayas R., 30 m. above its entrance into the Bay of Guayaquil; devastated by fire in 1896 and 1899; univ.; cath.; sawmills, foundries, machin., brewing; p. (1963) *506,000*.
Guayas, *prov.*, Ecuador; cap. Guayaquil; a. 8,331 sq. m.; p. (1960) *825,600*.
Guaynabo, *t.*, Puerto Rico W.I.; p. (1960) *40,257*.
Gubat, *mun.*, Luzon, Philippine Is.; hemp, coconuts, sugar-cane region; p. *22,880*.
Gubbio, *t.*, Perugia Italy; lustre ware; p. *30,850*.
Gubin (Guben), *t.*, *R. pt.*, on R. Neisse between E. Germany and Poland; formerly in Prussian prov. of Brandenburg; comm. ctr.; textiles, machin., leather, synthetic fibre; p. (estd. 1939) *45,800*.
Gudbrandsdal, *gr. valley*, S. Norway; leads S.E. from Dovre Fjeld towards Oslo; drained by R. Logan; used by main road Oslo to Trondheim; provides relatively lge. a. of cultivable land; hay, oats, barley, dairy cattle.
Gudiyatam, *t.*, Madras India; p. (1961) *50,384*.
Guebwiller, *t.*, Haut-Rhin, France; cottons; p. (1954) *10,414*.
Guelph, *c.*, Ontario, Canada; cloth, yarn, pottery, agr. and veterinary colleges; p. (1961) *39,838*.
Guernsey, Channel Is., between cst. of France and England; tomatoes, grapes (under glass), flowers, cattle; tourist res.; t. and ch. spt. St. Peter Port; a. 15,654 acres; p. (1961) (inc. Herm and Jethou) *45,126*.
Guerrero, *Pacific st.*, Mexico; cereals, cotton, coffee, tobacco; cap. Chilpancingo; ch. pt. Acapulco; a. 24,885 sq. m.; p. (1960) *1,186,716*.
Guiana, *region*, S. America; a. 179,000 sq. m.; comprises Guyana and Fr. Guiana and Surinam.
Guiana Highland, *plateau*, S. America; extends approx. 900 m. from E. to W. across S. parts of Venezuela, Guyana, Surinam, Fr. Guiana; steep sides, rounded tops approx. 3,000 ft. alt. but rises to 8,635 ft. in Mt. Roraima; chiefly composed crystalline rocks rich in minerals.
Guienne, *old French prov.*, separated by R. Garonne from Gascony.
Guildford, *c.*, *co. t.*, *mun. bor.*, Surrey, Eng.; 30 m S.W. London; on gap cut by R. Wey through N. Downs; cath.; univ.; vehicles, agr. implements, light inds.; residl., p. (1961) *53,977*.
Guinea, *ind. rep.* (Oct. 1958), formerly Fr. Guinea; member of Union of African States; iron-ore, bauxite, diamonds, groundnuts, palm oil; cap. Conakry; a. 94,900 sq. m.; p. (1965) *3,420,000*.
Guinea, general name for W. African coastlands round the greatest bend of G. of G. from the Gambia to the Congo.
Guinea, Portuguese. *See* **Portuguese Guinea.**
Guinea, Spanish. *See* **Spanish Guinea.**

Guinea Current, *ocean current*, flows W. to E. along Guinea Cst., diverted away from cst. in Bight of Benin by C. Three Points. [22,669.

Güines, *t.*, Havana, Cuba, W. Indies; sugar; p.

Guinobatan, *mun.*, Luzon, Philippine Is.; hemp; lime deposits; p. *26,419*.

Guipuzcoa, *Basque prov.*, Spain; mftg., minerals, agr.; cap. San Sebastian; tourism; a. 728 sq. m.; p. (1959) *455,388*.

Guisborough, *t.*, *urb. dist.*, N.R. Yorks, Eng.; in Cleveland iron-mng.; a. S.E. of Middlesbrough; steel, sawmilling, clothing; p. (1961) *12,079*.

Gujarat, *st.*, India; formerly part of Bombay st.; cap. temporarily Ahmedabad; new cap. Gandhinager, 13 m. N. of A. under construction; oil development in Cambay area; fertiliser plant projected; a. 72,245 sq. m.; p. (1961) *20,633,350*.

Gujranwala, *c.*, W. Pakistan; N. of Lahore; power plant projected; p. (1951) *120,860*.

Gujrat, *t.*, W. Pakistan; on Chenab R.; pottery and furniture; p. (1941) *22,000*. [*53,000*.

Gukhovo, *t.*, N. Caucasus, R.S.F.S.R.; p. (1959)

Gulbarga, *t.*, Gulbarga dist., Mysore, India; oil, cotton, flour, paint; p. (1961) *97,069*.

Gulf Basin, W. Australia; artesian well basin.

Gulfport, *t.*, Miss., U.S.A.; p. (1960) *30,204*.

Gulf Stream, current of the Atlantic, issuing from Gulf of Mexico by Florida Strait.

Gulf Stream Drift, *see* **North Atlantic Drift**.

Gummersbach, *t.*, N. Rhine-Westphalia, Germany; textiles, leather, metallurgy, paper, machin.; p. (1963) *32,400*.

Gumti, *R.*, trib. of Ganges, India; flows past Lucknow. [p. (1961) *187,122*.

Guntur, *t.*, Andhra Pradesh, India; cotton mftg.;

Gurgan (Asterabad), *t.*, N. Persia; nr. S.E. end of Caspian Sea; carpets, cotton, rice.

Guryev, *t.*, Kazakh S.S.R.; on mouth of R. Ural, entrance to Caspian Sea; petrol refining, engin.; oil pipeline to Orsk; p. (1959) *78,000*.

Gus-Khrustalnyy, *t.*, R.S.F.S.R., 40 m. S. of Vladimir; impt. ctr. of glass ind.; p. (1959) *53,000*.

Güstrow, *t.*, Schwerin, E. Germany; S. of Rostock; cas.; steel and wood inds.; rly. junction; p. (1963) *38,897*.

Gütersloh, *t.*, N. Rhine-Westphalia, Germany; nr. Bielefeld; silk and cotton inds.; famous for its Pumpernickel (Westphalian rye bread); machin., furniture, publishing, metallurgy; p. (1963) *53,300*.

Guyana, *indep. sov. st.* within Brit. Commonwealth (1966), S. America; flat, swampy cst., interior highlands; climate, very hot, heavy rainfall along cst.; tropical forests; agr.: sugar, rice, coffee; cattle; hardwoods; minerals: bauxite, diamonds, gold, manganese; copper in Cuyuni and Groete Creek areas; iron ore nr. Essequibo estuary; molybdenum at Eagle Mt.; poor communications; cap. Georgetown; a. 83,000 sq. m.; p. (estd. 1965) *650,000*; option of becoming rep. after beginning of 1969

Guthrie, *t.*, Okla., U.S.A.; p. (1960) *9,502*.

Gwadar, *t.*, W. Pakistan; p. *15,000*.

Gwalior, *dist.*, Madhya Pradesh, India; a. 2,002 sq. m.; p. (1961) *657,876*.

Gwalior, *t.*, Madhya Pradesh, India, formerly Lashkar, 76 m. S. of Agra; cotton spinning, muslin, carpets, cereals, sugar-cane; bauxite; p. (1961) *300,587* inc. Morar. [Pakistan.

Gwatar, *spt.* on G. of Oman, Persia; by border of

Gwelo, *t.*, Rhodesia; impt. indust. ctr.; p. (1961) *37,590* inc. *8,590* Europeans.

Gwent, Plain of (Vale of Glamorgan), *lowland dist.*, Glamorgan, S. Wales; lies S. of moorland of S. Wales Coalfield, extends E. into Monmouth; fertile soils; mixed farming except in industl. areas of Cardiff, Barry.

Gympie, *t.*, Queensland, Australia; on Mary R., 106 m. from Brisbane; former goldfield; now dairying and pastoral dist., with extensive banana plantations; p. (1961) *11,082*.

Györ, *c.*, Hungary; at junction of R. Raab with arm of R. Danube; cath.; horses, textiles, chemicals, engin.; p. (1962) *72,319*.

Haarlem, *t.*, cap. N. Holland prov., Netherlands; textiles, printing, brewing, bulb growing; cath.; p. (1967) *172,268*.

Habab, *dist.*, W. coast Red Sea, Ethiopia.

Hachioji, *c.*, Honshu, Japan; weaving, silk-cotton mixtures; p. (1964) *178,000*.

Hackensack, *t.*, N.J., U.S.A.; iron foundries, silk, jewellery, paper; p. (1960) *30,521*.

Hackney, *inner bor.*, N.E. London, Eng.; incorporates former bors. of Shoreditch and Stoke Newington; furniture, clothing, footwear; p. (1964) *257,301*.

Haddington, *burgh*, *cap.*, E. Lothian, Scot.; on R. Tyne 16 m. E. of Edinburgh; woollen mnf.; grain mkt., corn mills, lt. engin., hosiery; p. (1961) *5,506*.

Haderslev, *t.*, Denmark; tobacco, clothing, knitted goods p. (1960) *19,735*.

Hadhramaut, *dist.*, Southern Yemen; ch. pt. and c. Mukalla; fertile coastal valley; frankincense, aloes, tobacco, shawls, carpets; p. *150,000* (estd.).

Hadsund, *t.*, Jutland, Denmark; p. (1960) *3,424*.

Ilminster, *t.*, *urb. dist.*, Somerset, Eng.; 10 m. S.E. of Taunton; cutstone, concrete, collars, radio valves; p. (1961) *2,784.*

Ilobasco, *c.*, Salvador, Central America; cattle, coffee, sugar, indigo; p. *21,225.*

Iloilo, *cap.*, prov of Iloilo, Panay, Philippines coconut oil; p. (1960) *151,266.*

Ilorin, *t.*, N. Nigeria, W. Africa; on Lagos–Kano rly.; agr. and caravan ctr.; govt. sugar growing scheme at Bacita; p. *54,686.*

Iluka, *spt.*, N.S.W., Australia; on Clarence R., N. of Sydney

Imabari, *t.*, *spt.*, N.W. Shikoku, Japan; on shore of Inland Sea; mnfs. cotton textiles, paper, canned fruits; p. (1960) *100,082.*

Imbabura, *prov.*, Ecuador; a. 2,414 sq. m.; cap. Ibarra; p. (1960) *182,700.*

Imbros, *Turkish I.*, Ægean Sea; fertile fruit-growing dist.

Immingham, *pt.*, Lindsey, Lincoln, Eng.; on S. cst. of Humber, 8 m. N.W. of Grimsby; lge. docks; new dry dock; chemicals, engin., refinery nearby at Killingholme.

Imola, *t.*, Italy; S.E. of Bologna; cath.; glass, pottery; p. (1961) *51,289.*

Imperial Valley, S. Cal., U.S.A.; extends 30 m. S.E. from Salton Sea to Mexican bdy.; mainly below sea-level; hot, arid climate; cotton, dates, wheat under irrigation; water brought from Colorado R. by Imperial Canal (Laguna Dam) and All-American Canal (Imperial Dam) nr. Yuma · total irrigated a. (1938) 700 sq. m.

Imphal, *ch. t.*, Manipur, India; p. (1961) *67,717.*

Inari L., *extensive L.*, Lappi, Finland; outlet into Barents Sea; a. 685 sq. m.

Inca, *t.*, I. of Majorca, Spain; p. (1957) *12,522.*

Ince-in-Makerfield, *urb. dist.*, Lancs., Eng.; nr. Wigan; coal, cotton, engin., wagon-bldg.; p. (1961) *18,027.*

Inchgarvie, *islet*, F. of Forth, Scot.; forms central support of the Forth rail bridge.

Inchkeith, *fortfd. I.*, F. of Forth, Fife, Scot.

Inchon, *spt.*, S. Korea; on W. cst.; exp. soya beans, rice; glass; p. (1962) *430,000.*

Indan, *mun.*, Luzon, Philippine Is.; rice; p. *11,240.*

Independence, *t.*, Mo., U.S.A.; on prairie, S. of Missouri R.; p. (1960) *62,328.*

Independence, *t.*, Iowa, U.S.A.; p. (1960) *7,069.*

Independence, *t.*, Kan., U.S.A.; p. (1960) *11,222.*

India, *peninsula subcontinent*, Asia; comprises India, Pakistan, and Ceylon; ch. mtns.: Himalayas (Everest 29,028 ft.), E. and W. Ghats, Sulaimain range, Hindu Kush, Karakoram; Ganges Plain, Thar desert; ch. Rs.: Indus, Ganges, Brahmaputra; climate: monsoonal; vegetation: dense forests in region of high rainfall; sal, teak; elsewhere savannah or jungle, bamboo; coconuts on cst.; variety of races; inds.: agr., rice, wheat, millet, sugar-cane, cotton, jute, tea, rubber, linseed, cattle, sheep, goats; forests, timber; minerals: coal petroleum, manganese, lead, gold, silver; mnfs.: cottons, jute, milling, engin., machin., brass, carpets; communications: good rail and sea; total a. 1,606,742 sq. m.; total p. (1961) approx. *542,851,695.*

India, Republic of (Indian Union), *indep. sov. st.* within Br. Commonwealth (1947), consists of 17 states and 10 centrally adm. terrs.; cap. New Delhi; mainly agr.; ch. crops, rice wheat, sugar-cane, millet, maize, barley; prin. expts. tea, cottons, fabrics, raw cotton, leather, fruits, nuts, iron and other metal ores; industl. expansion; intern. airpts., New Delhi, Calcutta, Bombay; a. 1,178,995 sq. m.; p. (1966) *498,000,000.*

Indian Harbour, Labrador cst., nr. Hamilton Inlet, Canada.

Indian Ocean extends from S. of Asia and E. of Africa to the C. of Good Hope and C. Leeuwin in Australia, separated from the Pacific by the Malay Archipelago and Australia; a. 29,340,000 sq. m.

Indian Territory, since 1907 part of the st. of Okla., U.S.A.

Indiana, *st.*, between Kentucky and Michigan, Illinois and Ohio, U.S.A.; agr., coal, limestone, clay, petroleum, cement, glass; cap. Indianapolis; a. 36,291 sq. m.; p. (1960) *4,662,498.*

Indianapolis, *cap.*, Ind., U.S.A.; on White R.; impt. rly. ctr.; meat packing, jet engines, aircraft parts, chemicals, pharmaceutics; p. (1960) *476,258.*

Indigirka R., Yakut, U.S.S.R.; flows into Laptev Sea; length 1,100 m.

Indo-China, S.E. Asia; federation in French Union until end of hostilities July 1954. Consisted of the three sts. of Viet-Nam, Cambodia and Laos.

Indonesia, Republic of, S.E. Asia (comprising Java, Sumatra, Kalimantan, Sulawesi, West Irian, 15 minor Is., thousands of smaller ones); climate: tropical, abundant rainfall; equatorial forest; race: Malay; agr.: rice, maize, sweet potatoes, sugar-cane, coffee, tea, tobacco, oil palms, cinchona, spices, rubber; petroleum, tin, coal, bauxite; mineral wealth; cap. Djakarta (Batavia); p. (1965) *103,100,000.*

Indore, *t.*, Madhya Pradesh, Indian Union; in valley of R. Narbada; cotton-mills; p. (1961) *394,941.*

Indre, *dep.*, Central France; agr. and industl.; cap. Châteauroux; a. 2,666 sq. m.; p. (1962) *251,432.*

Indre-et-Loire, *dep.*, Central France; to the N.W. of Indre; agr., vines, silk factories; cap. Tours; a. 2,377 sq. m.; p. (1962) *395,210.*

Indus, *R.*, W. Pakistan; rises in Tibet, and flows through Kashmir, Punjab, Sind, to the Arabian Sea; length 1,800 m.; 5 tribs.: Jhelum, Chenab, Ravi, Beas, Sutlej, one of world's

major R. systems; Indus Waters irrigation scheme under development.

Inebolu, *spt.*, Anatolia, Turkey; on cst. of Black Sea; tr. in mohair and wool; p. (1960) *5,886*.

Ingersoll, *t.*, Ontario, Canada; N.E. of Hamilton; p. (1961) *6,874*.

Ingleborough, *mtn.*, near Settle, Yorks, Eng.; limestone; underground caves, stalactites, stalagmites; alt. 2,373 ft.

Inglewood, *c.*, S.W. Cal., U.S.A.; chinchilla farms; furniture; light engin.; p. (1960) *63,390*.

Ingolstadt, *t.*, Bavaria, Germany; on Danube, nr. Munich; cas.; machin., cars, tobacco, oil refining; oil pipeline from Genoa; transalpine pipeline under construction from Trieste, through N.E. Italy and Austria to Ingolstadt.; p. (1963) *64,600*.

Inhambane, *spt.*, Mozambique; sugar, copra, oil-seeds, bricks, soap, tiles; p. (1960) *67,265*.

Inishmore, *lgst. of Aran Is.*, Galway, Ireland; 30 m. S.W. of Galway; fishing; p. *1,800*.

Inkerman, *t.*, Crimea, U.S.S.R.; nr. E. extremity of Sevastopol harbour; battle 1854.

Inkpen Beacon, *hill*, Berks., Eng.; W. end of N. Downs, 7 m. S.W. of Newbury; highest point reached by chalk hills in Eng.; alt. 975 ft.

Inkster, *t.*, S.E. Mich., U.S.A.; residtl.; p. (1960) *39,097*.

Inland Sea, Japan; length 250 m., breadth 10–40 m.; ch. spts.: Hiroshima, Okayama, Kobe.

Inn, *R.*, traversing Switzerland, the Austrian Tyrol and Bavaria; enters R. Danube at Passau; the ancient Œnus; length 320 m.

Innerleithen, *burgh and health resort*, Peebles, Scot.; on R. Tweed, 5 m. S.E. of Peebles; woollen cloth and knitwear; p. (1961) *2,299*.

Inner Mongolia, *aut. region*, N. China; stretches along S. border of Mongolian People's Rep.; cap. Huhehot; p. (1957) *9,200,000*.

Innisfail, *t.*, Queensland, Australia; ch. sugar-producing ctr. of Australia; p. *4,000*.

Innsbruck, *cap.*, the Tyrol, Austria; on R. Inn; commands N. approach to Brenner Pass; univ.; military stronghold; p. (1963) *103,000*.

Inowroclaw, *t.*, N. Poland; nr. Bydgoszcz; rock-salt, iron pyrites; agr. prod.; p. (1960) *47,000*.

Insterburg, *see* **Tchernjachowsk.**

Interlaken, *t.*, Bernese Oberland, Berne, Switzerland; on R. Aar, between Ls. Thun and Brienz; tourist resort; p. (1957) *4,368*.

Inuvik, *t.*, Canadian Arctic; built above the permanent frost.

Inveraray, *burgh*, Argyll, Scot.; nr. head of Loch Fyne; herring fishing; p. (1961) *501*.

Inverbervie, *burgh*, Kincardine, Scot.; on E. cst., 8 m. S. of Stonehaven; linen, rayon inds.; p. (1961) *921*.

nvercargill, *c.*, S.I., N.Z.; on S.E. cst.; sawmills, freezing wks.; aluminium smelter; served by Bluff Harb.; p. (1961) *41,087*.

Inverell, *t.*, N.S.W., Australia; 383 m. N. of Sydney; p. (1961) *8,202*.

Invergordon, *burgh*, *spt.*, Ross and Cromarty, Scot.; on N. side of Cromarty Firth, 12 m. N.E. of Dingwall; naval pt.; lge. chemical ind. projected; p. (1961) *1,640*.

Inverkeithing, *burgh*, Fife, Scot.; on F. of Forth, nr. Dunfermline; shipbreaking, paper mkg., quarrying; p. (1961) *4,069*.

Inverkip, *par.*, *vil.*, Renfrew, Scot.; 6 m. S.W. of Greenock; par. contains Gourock; wat. pl.; p. (1951) *17,288*.

Inverness, *co.*, Scot.; mountainous and well wooded; rising to Ben Nevis 4,406 ft.; Caledonian Canal crosses co.; little cultivation; deer forests and grouse moors, fishing, sheep breeding, distilleries; hydroelec. schemes at Foyers, Glen Cannich, and Lochaber; a. 4,851 sq. m.; p. (1961) *83,425*.

Inverness, *burgh*, *co. t.*, Inverness, Scot.; on Moray Firth nr. N.E. end of Caledonian Canal; distilleries, light engin., tweeds; fisheries and agr.; p. (1961) *29,773*.

Inverurie, *burgh*, Aberdeen, Scot.; on R. Don, 14 m. N.W. of Aberdeen; rly. ctr., wool fair; tourism; p. (1961) *5,152*.

Investigator I., off cst. of Eyre Peninsula, S. Australia.

Inyokern, *t.*, E. Cal., U.S.A.; naval ordnance research sta.; p. (1960) *11,684*.

Ioannina (**Janina**), *prefecture*, Epirus, Greece; ch. t. Ioannina; p. (1961) *154,201*.

Ioannina (**Janina**), *t.*, Epirus, Greece; nr. Albanian frontier; embroidery; p. (1961) *34,997*.

Iona, *I.*, off cst. of Mull, Argyll, Scot.; early Scottish Christian ctr.; restored abbey; St. Columba's burial place; ancient burial place of Scottish kings.

Ionian Is., gr. in Mediterranean, belonging to Greece, formerly under British protection; comprising Kerkyra (Corfu), Kephallenia, Zákynthos, Levkás, Ithake, Paxos and Kytherá; suffered from severe earthquakes in Aug. 1953; total a. 752 sq. m.; p. (1961) *212,573*.

Ionian Sea, Mediterranean; between Greece on E; Italy and Sicily on W.

Iowa, *st.*, U.S.A.; prairie cty; over 1,000 ft. above sea-level; watered by Mississippi and Missouri; farming, dairying, maize, wheat, oats, potatoes; coal; cars, chemicals; cap. Des Moines; a. 56,290 sq. m.; p. (1960) *2,757,537*.

Iowa City, Iowa, U.S.A.; farming, stockbreeding; p. (1960) *33,443*.

Ipin (**Yibin**), *c.*, Szechwan prov., China; cereals, match mfg.; p. (1953) *176,000*.

Ipoh, *t.*, Perak, Malaya; tin; textiles; p. *80,874*.

Ipswich, *co. t.*, *co. bor.*, Suffolk, Eng.; at head of estuary of R. Orwell; agr. implements, brewing, clothing, printing; p. (1961) *117,325*.

Ipswich, *c.*, S.E. Queensland, Australia; coal, woollens; p. (1961) *48,668*.

Iquique, *c.*, N. Chile, a pt. on Pacific; exports nitrates and iodine from Atacama desert; fish canning; p. (1960) *53,800*.

Iquitos, *ch. t.*, Loreto, Peru; shipyards, docks; rubber, cotton, saw-mills, oil refining; p. (1961) *54,300*.

Iraklion (**Heraklion**), *prefecture*, Crete; cap. Iraklion; p. (1961) *207,437*.

Iraklion (**Candia**), *cap.*, Crete; central position on N. cst. at foot of terraced hill slopes; wine, olive oil, fishing; p. (1961) *63,458*.

Iran (**Persia**), *kingdom*, S.W. Asia; central tableland 3,000–5,000 ft.; ch. range Elburz mtns., (Demavend 18,500 ft.); Rs. few; centre mainly arid, N. cst. and parts of W. very fertile; climate varies widely; agr.: rice, cotton, tobacco, fruits, nuts; impt. oil ind., carpet mnfg.; heavy ind. and mng. developing; exp. of natural gas to U.S.S.R. projected; cap. Tehran; a. 628,000 sq. m.; p. (1967) *25,781,000*.

Irapuata, *c.*, central Mexico; agr. ctr.; p. *60,000*.

Iraq, *rep.* (since July 1958), S.W. Asia; approx. co-extensive with ancient Mesopotamia; ch. Rs.: Tigris, Euphrates; climate: hot, rainless in summer, cool in winter, scanty rainfall; agr. depends on irrigation; ch. crops, dates, cotton, wheat, maize, barley; impt. oilfields; lgst. pt. Basra; cap. Baghdad; dam and power sta. on Euphrates projected; a. 116,600 sq. m.; p. (1965) *7,085,000*.

Irbit, *t.*, Sverdlovsk region, U.S.S.R.; engin., motor cycles, wood-wkgs., pharmaceutics; mkt., famous fair; p. (1956) *41,200*.

Ireland, 2nd. lgst. I., Brit. Is.; ch. physical features; L. Neagh in N.E., Rs. Shannon, Boyne, Blackwater, Barrow, Nore, Suir, Liffey; ch. mtn. groups—all near cst.—Mourne Mtns., Wicklow Mtns., Mtns. of Kerry; climate, mild and damp; called "the emerald isle" because of its grasslands; a. 32,000 sq. m.; p. (1961) *4,321,411*.

Ireland, Republic of (**Eire**), *sov. ind. st.* covering 26 of the 32 cos. of Ireland inc. the 3 provs. of Leinster, Munster and Connaught (Cannacht) together with 3 of the cos. (Cavan, Monaghan and Donegal), of the former prov. of Ulster. Ceased to be member of Brit. Commonwealth in 1949; mainly agr.: root crops, oats, barley; livestock; fisheries; main industl. development around cap. Dublin; a. 26,600 sq. m.; p. (1966) *2,880,752*.

Irish Sea, Brit. Is.; between Gt. Britain and Ireland, connecting N. and S. with Atl. Oc.; 200 m. long; 50–140 m. wide; greatest depth 140 fathoms; a. 7,000 sq. m.

Irkutsk, *t.*, R.S.F.S.R.; on R. Angara; on Trans-Siberian Rly.; univ.; engin., sawmilling, petroleum refining, chemicals; hydro-elec. power stn.; p. (1962) *385,000*.

Irlam, *t.*, *urb. dist.*, Lancs, Eng.; steel, engin., tar, soap, glycerine, margarine; p. (1961) *15,365*.

Iron Country, Utah, U.S.A.; vast reserves of iron ore; undeveloped due to inaccessibility.

Iron Gate, Romania; famous rapids in R. Danube; Romanian-Yugoslavian hydro-elect. and navigation project, 1964–71.

Iron Knob, *t.*, S. Australia; S.W. of Port Augusta; iron ore.

Iron Mountain, *t.*, Mich., U.S.A.; former iron mining ctr.; p. (1960) *9,299*.

Ironton, *c.*, Ohio, U.S.A.; machin.; coal, iron, fireclay; p. (1960) *15,745*.

Ironwood, *t.*, Mich., U.S.A.; iron-mining, lumbering; p. (1950) *11,466*.

Irrawaddy, *R.*, Burma; flows S. to Bay of Bengal; navigable for lge. steamers 900 m.; irrigation wks.; length 1,300 m.

Irthlingborough, *t.*, *urb. dist.*, Northants., Eng.; p. (1961) *5,125*.

Irtysh, *R.*, Siberia, U.S.S.R.; trib. of R. Ob; two-thirds navigable; crossed by Trans-Siberian Rly. at Omsk; length 2,500 m.

Irun, *t.*, N.E. frontier, Spain; nr. San Sebastian; tanning and brandy distillery; paper mills, iron; Roman remains; p. (1957) *19,956*.

Irvine, *royal burgh*, *spt.*, Ayr, Scot.; nr. mouth of R. Irvine, 7 m. W. of Kilmarnock; hosiery, lt. engin., bottle, chemical wks.; p. (1961) *16,910*.

Irvington, *t.*, N.J., U.S.A.; p. (1960) *59,379*.

Irvington, *t.*, N.Y., U.S.A.; residtl.; light engin.; p. (1960) *5,494*.

Irwell, *R.*, S. Lancs, Eng.; flows past Manchester to the Mersey; length 30 m.

Isa Town, *new t.*, Bahrain; 4 m. from Manamah; proposed p. *35,000*.

Isarco, *R.*, N. Italy; rises nr. Brenner Pass, flows S. into R. Adige at Bolzano; used by main rail and road routes from N. Italy to Austria; length 50 m.

Ischia, *I.*, in G. of Naples, Italy; saline baths; cap. I.; a. 26 sq. m.; p. *30,000*.

Ischl, *t.*, Austria; wat. pl., saline baths; p. (1961) *12,703*.

Isdud (Ashdod), *ancient Philistine c.*, Israel; 20 m. S. of Jaffa.

Ise Bay, *inlet*, S. Honshu, Japan; flanked by ch. textile mftg. a. of Japan with 5 million people ctred on Nagoya; length 40 m., width 15–20 m.

Iselle, *t.*, N.W. Italy; S. terminal of Simplon Pass and tunnel.

Isère, *dep.*, S.E. France; drained by Rs. Isère and Rhône; cap. Grenoble; mtnous.; cereals; wine, butter cheese; iron, coal, lead, silver, copper; gloves, silks; a. 3,178 sq. m.; p. (1962) *729,789*.

Isère, *R.*, S.E. France; rises in W. Alps (Grande Sassière), flows W. into R. Rhône nr. Valence; used to generate hydro-elec.; used, with trib. R. Arc, by main rly. from France to N. Italy through Mt. Cenis (Fréjus) Tunnel.

Iserlohn, *t.*, N. Rhine-Westphalia, Germany; iron, steel, metalwks.; needles; p. (1963) *56,300*.

Iseyin, *t.*, Lagos st., Nigeria, W. Africa.

Isfahan (anc. Aspadana), *c.*, central Iran; prov. cap.; historical and picturesque c., noted for its carpets and metalware; steel mill under constr.; tourism; airpt.; p. (1967) *862,454*.

Ishikari, *t.*, Hokkaido, Japan; on cst. of Otaru Bay, 10 m. N. of Sapporo; ctr. of second lgst. coalfield in Japan; sm. petroleum production.

Ishimbay, *t.*, Bashkir A.S.S.R., R.S.F.S.R.; on R. Belaya; ctr. of Ishimbay oilfields; p. (1956) *44,400*.

Ishpeming, *c.*, Mich., U.S.A.; machin., gold, silver, iron, marble; p. (1960) *8,857*.

Isiro (Paulis), *t.*, N.E. Congo; admin. offices; cotton ginneries; rly. repair shops.

Isis, *R.*, head stream of R. Thames, Eng.; so named until its confluence with Thames at Dorchester, Oxfordshire.

Iskenderun, *spt.* Hatay, Turkey; pt. and rly. terminus; oil; fertilisers; p. (1965) *69,259*.

Islamabad, *cap.*, Pakistan; outside Rawalpindi below Himalayas; nuclear power sta.

Islay, *I.*, Inner Hebrides; Argyll, Scot.; 13 m. W. Kintyre; a. 235 sq. m.; farming, dairying, distilleries.

Isle of Grain, *rural a.*, Kent; flat promontory once separated from mainland by a tidal estuary; lge. oil refinery.

Isle Royale, *I.*, in L. Superior, Mich., U.S.A.; length 40 m.

Isleworth, *see* **Hounslow**.

Islington, *inner bor.*, London, Eng.; N. of City incorporates former bor. of Finsbury; univ. industl. and residtl.; p. (1964) *261,822*.

Ismailia, *t.*, U.A.R., at mid-point of Suez Canal on L. Timsah, 45 m. N.N.W. of Suez; has rail connections with Cairo, Suez and Port Said; p. (1960) *25,194*.

Isna (Esneh), *t.*, Upper U.A.R.; caravan ctr.; barrage; p. (1947) *18,458*.

Isonzo, *R.*, Illyria, Italy; flows into Adriatic Sea.

Isparta, *t.*, Turkey; N. of Antalya; p. (1965) *42,968*.

Ispra, *t.*, Varese, Italy, nr. L. Maggiore; nuclear research ctr.

Israel, *indep. Jewish rep.*, since 1948; part of former Palestine mandate; cap. Jerusalem, impt. ts. Tel Aviv, Haifa; mainly agr.; grains, vegs., olives, citrus-fruit prod.; processed foods, textiles, wearing apparel, pharmaceuticals; little mineral wealth except for potash and other chemicals from Sea of Galilee and Dead Sea; a. 8,050 sq. m.; p. (1964) *2,525,600*.

Issoudun, *t.*, Indre, France; leather, parchment, woollens, farm implements; p. (1954) *12,945*.

Issy, *t.*, France; on R. Seine; sub. of Paris; p. (1962) *53,298*.

Issyk-kul, *L.*, Kirgizia, U.S.S.R.; alt. 4,476 ft.; a. 250 sq. m.; drained by R. Chu.

Istanbul (Constantinople), *ch. spt.*, former cap., Turkey; on Golden Horn pen. on European cst. at entry of Bosporus into Sea of Marmara; div. into old "Stamboul" on S. side and dists. of Galata and Beyoglu (Pera) on N.; the ancient Byzantium; magnificent mosque of Sta Sophia; light inds.; p. (1965) *1,750,642*.

Istria, *peninsula*, N. Adriatic Sea; formerly Italian, now divided between Jugoslavia and Italy; agr., olives, vines, oranges, maize; rural p. mainly Slavs, ts. mainly Italian.

Ita, *c.*, S. Paraguay; cattle, agr.; leather; p. *16,892*.

Itabira, *t.*, Minas Geraes st., Brazil; on Brazilian Plateau, 60 m. N.E. of Belo Horizonte; lgst. deposits of iron ore in Brazil.

Itabuna, *c.*, E. Brazil; coffee, tobacco; p. (1960) *54,268*.

Itajaí, *t.*, at mouth of Itajai R., S. Brazil; exp. lumber, tobacco, starch, sassafras oil; p. (1960) *55,000*.

Italy, *rep.*, S. Europe; peninsula 750 m. long and 100–120 m. broad; many Is. (ch. Sardinia, Sicily); mtns. in N. (Alps) and in ctr. and S. (Apennines); ch. R. Po; climate, Mediterranean; wheat and other cereals; vines, olives, fruit; cattle, sheep; sulphur, iron and iron pyrites, mercury, lead, zinc; Carrara marble; hydro-elec. power, natural gas; mnfs.; cottons, silks, sugar, glass, furniture, olive oil; gen. engin., cars; fisheries; cap. Rome; a. 116,235 sq. m.; p. (1963) *52,520,000*.

Itasca, *L.*, a source of Mississippi R. Minn., U.S.A.; alt. 1,575 ft.

Itatiaia, *mtn.*, highest mtn. in Brazil; 9,255 ft.

Itaugua, *t.*, S.W. Paraguay; lace mkg.; p. *11,300*.

Itchen, *R.*, Hants, Eng.; flows to Southampton Water; length 25 m.

Ithaca, *t.*, N.Y., U.S.A.; on Cayuga L.; seat of Cornell Univ.; elec. clocks; p. (1960) *28,799*.

Ithake, *one of the Ionian Is.*, Greece; a. 37 sq. m.; ch. t. Ithake; severe earthquake, 1953.

Ito, *t.*, Honshu, Japan; on E. cst. of Izu pen.; hot-spring resort; p. (1965) *59,404*.

Itzehoe, *t.*, Schleswig-Holstein, Germany; on Stor R.; wood, cement, machin.; p. (1963) *36,900*.

Ivano-Frankovsk, *t.*, Ukrainian S.S.R.; oil; p. (1959) *66,000*.

Ivanovo, *t.*, R.S.F.S.R.; N.E. of Moscow; textiles, iron and chemical wks.; peat-fed power stns.; p. (1962) *360,000*.

Ivigtut, *Danish settlement*, S.W. Greenland; cryolite.

Iviza, *I.*, Balearic gr. in the W. Mediterranean; Spanish; cath., fortress.

Ivory Coast, *ind. sov. st.*, within French Community, W. Africa; climate, tropical; maize, coffee, rubber, mahogany; dense forests; cap. Abidjan; a. 124,000 sq. m.; p. (1963) *3,750,000*.

Ivrea, *t.*, Italy; on the Dora Baltea, nr. Turin; silks, cotton mnfs.; p. *14,473*.

Ivry-sur-Seine, *t.*, France; on R. Seine, sub. of Paris; organs, chemicals, iron and steel; p. (1962) *53,646*.

Iwamizawa, *t.*, W. Hokkaido, Japan; rly. junction; coalfield; p. (1960) *60,650*.

Iwanai, *spt.*, S.W. Hokkaido, Japan; copper, coal, sulphur; fisheries; p. (1947) *20,394*.

Iwo, *t.*, Nigeria, W. Africa; nr. Ibadan; p. (1953) *100,000*.

Izegem, *commune*, N.W. Belgium; linen, tobacco; p. (1962) *17,157*.

Izhevsk, *t.*, R.S.F.S.R.; steel, engin.; p. (1962) *322,000*

Izieux, *t.*, Loire, France; nr. St. Etienne.

Jumna, *R.*, N. India; ch. trib. of R. Ganges; rises in the Himalayas and flows past Delhi and Agra to Allahabad; length 860 m.
Junction City, Kan., U.S.A.; p. (1960) *18,700*.
Jundial, *t.*, S.E. Brazil; rly. junction; textiles, steel; p. (1960) *79,536*.
Juneau, *c.*, cap., Alaska, U.S.A.; at foot of Chilkoot mtns.; lumbering; fisheries; gold settlement (1881); p. (1960) *6,797*.
Jungfrau, *peak*, Bernese Oberland, Switzerland; height 13,642 ft.; electric rly. from Kleine Scheidegg to Jungfraujoch.
Juniata, *R.*, Penns., U.S.A.; flows to the Susquehanna at Petersburg.
Junin, *inland dep.*, Peru; traversed by the Andes; copper, silver, lead; ch. t. Huancayo; a. 22,814 sq. m.; p. (1961) *507,908*.
Jura, *mtns.*, Switzerland and France; highest peak Crête de la Neige; alt. 5,654 ft.; length 180 m., width up to 30 m.
Jura, *dep.*, E. France; named from the mtns.; many vineyards; forests, cereals, watches, toys; a. 1,951 sq. m.; p. (1962) *225,682*.
Jura, *I.*, Argyll, Scot.; off W. cst.; a. 146 sq. m.
Juticalpa, *t.*, Honduras, C. America; cattle, cereals, sugar; p. (1961) *3,836*.
Jutland, *peninsula*, Denmark; intensive agr. and poultry farming; a. 11,411 sq. m.; p. (1960) *2,018,168*.
Jyväskylä, *t.*, central Finland; mkt.; pulp and paper; p. (1961) *39,916*.

K², *see* Godwin-Austen, Mt.
Kabankalan, *mun.*, Negros Occidental, Philippine Is.; agr.; p. *29,315*.
Kabansk, *t.*, E. Siberia, U.S.S.R.; nr. L. Baikal; agr. and industl.
Kabarda-Balkar, A.S.S.R., Transcaucasia, U.S.S.R.; non-ferrous metals, gold, platinum, iron ore, coal, arsenic; a. 4,800 sq. m.; p. (1959) *420,000*.
Kabinda, *t.*, Angola, W. Africa; on W. cst., 30 m. N. of Congo estuary; p. *1,000*.
Kabul, *c.*, *cap.*, Afghanistan; on R. Kabul, S. of the Hindu Kush; 6,900 ft. above sea level; univ.; excellent climate; p. (estd. 1964) *400,000*.
Kabul, *R.*, flowing through Afghanistan to the R. Indus at Peshawar, Pakistan; length 270 m.
Kachin State, *div.*, Burma; comprising former Myitkyina and Bhamo dists; 29,500 sq. m.
Kadina, *t.*, S. Australia; 6 m. E. of Wallaroo; comm. ctr.; ctr. of mixed farming area.
Kadiyevka, *t.*, Ukrainian S.S.R.; coal, iron and steel, synthetic rubber; p. (1959) *180,000*.
Kaduna, *t.*, N. Nigeria; cap. of Northern Provs.; impt. rly. junction with main rlys. to Lagos, Pt. Harcourt; p. *10,000*.
Kaffraria, *extensive dist.*, Cape Province, S. Africa; comprising Griqualand E., Tembuland, Transkei, and Pondoland.
Kafue, *R.*, Zambia; famous gorge.
Kagoshima, *spt.*, at S. end of Kyushu I., Japan; rocket launching site nearby at Uchinoura; p. (1965) *328,446*.
Kahoolawe, *I.*, Hawaiian Is.; a. 45 sq. m.; uninhabited.
Kai Islands, *Is.*, Indonesia; between New Guinea and Timor; timber; a. 680 sq. m.; p. *51,000*.
Kaiapoi, *t.*, S.I., N.Z.; on the Waimakariri R., 14 m by rail from Christchurch; woollens; p. (1961) *3,109*.
Kaieteur Falls, Guyana, S. America; located where R. Potaro leaves Guiana Highlands; among world's highest falls (741 ft.).
Kaifeng, *c.*, *cap.*, Honan, China; on Hwang-Ho R.; one of the most ancient cities in China; cottons; p. (1953) *299,000*.
Kaikoura, *t.*, S.I., N.Z.; on E. cst., 80 m. N.E. of Lyttelton; in this region are the Kaikoura ranges, in which the highest peaks are Tapuaenuku (9,465 ft.) and Alarm (9,400 ft.).
Kaiping, *t.*, Hopeh, N. China; 80 m. N.E. of Tientsin; second lgst. coal-mining a. (Kailan mines) in China; coal exported through Chinwangtao.
Kairouan, *holy c.* of the Moslems, Tunisia N. Africa; 80 m. S.S.E. of Tunis; founded *c.* A.D. 670; mosque; p. (1961) *34,000*.
Kaiserslautern, *t.*, Rhineland Palatinate, Germany; nr. Mannheim; iron, textiles, machin., tobacco, wood; p. (1963) *86,900*.
Kaiser Wilhelm's Land, *Australian Dependency*, Antarctica.
Kaishu, *cap.* of Kokai prov., W. Korea; p. *29,688*.
Kajaani, *t.*, on Oulu L., Finland; p. (1961) *14,683*.
Kakamega, *t.*, Kenya, E. Africa; 30 m. N. of Kisumu; ctr. of gold-mining dist.
Kakhovka, *t.*, Ukrainian S.S.R.; on R. Dnieper; hydro-elec. sta.; p. (1956) *19,200*.
Kakinada, *t.*, *spt.*, Andhra Pradesh, India; cotton, oil seeds; p. (1961) *122,865*.
Kalafat, *t.*, Romania; on R. Danube, opposite Vidin.
Kalahari Desert, *gr. infertile tract* of S. Central Africa, between the R. Orange and the Zambesi; mainly in Botswana; alt. 3,700 ft.; a. 20,000 sq. m.; inhabited chiefly by Bushmen.
Kalamata, *t.*, Peloponnese, Greece; nr. Sparta; silk ind., figs, currants, olive oil exp.; p. (1961) *38,211*.
Kalamazoo, *c.*, Mich., U.S.A.; rly. ctr., engin.; college; p. (1960) *82,089*.
Kalat, *div.*, W. Pakistan; a. 53,995 sq. m.; p. (1961) *589,000*.

Kalgan (Zhangjiakou), *c.*, Hopeh prov., China; nr. Gt. Wall 110 m. N.W. of Peking; tea, wool, hides; p. (1953) *229,000*.

Kalgoorlie, *t.*, W. Australia; on transcontinental rly. route 350 m. E. of Perth; semi-desert conditions; gold-mng. a.; p. (1961) *21,770*.

Kalimantan (Indonesian Borneo); oil, rubber, rice, hardwood; a. 208,286 sq. m.; quartzites discovered in S.E.; p. (1961) *4,101,475*.

Kalinin, *t.*, R.S.F.S.R.; on trib. of R. Volga; cath.; engin., textiles, chemicals; p. (1962) *286,000*.

Kaliningrad, *prov.*, R.S.F.S.R., U.S.S.R.; cap. K., oil discovered in a.

Kaliningrad (formerly **Königsberg**), *t.*, formerly E. Prussia, now U.S.S.R.; on R. Pregel; cath.; fine bldgs; shipbldg., machin., wood-pulp, chemicals, sugar-beet; tea ctr.; p. (1959) *202,000*.

Kalisz, *t.*, Poland; on R. Prosna; industl. ctr., textiles; oldest Polish t., mentioned in 2nd century A.D. by Ptolemy; p. (1965) *75,000*.

Kalmar, *co.*, S. Sweden; cap. Kalmar; a. 4,485 sq. m.; p. (1961) *235,770*.

Kalmar, *spt.*, Sweden; on E. cst.; matches, shipbldg., food inds.; p. (1961) *30,839*.

Kalna, *vil.*, on Mt. Trara Planina, Yugoslavia; uranium mine and plant; nuclear power sta.

Kalocsa, *t.*, Hungary; on R. Danube; cath., palace; wine; p. (1962) *13,786*.

Kaluga, *t.*, R.S.F.S.R.; on R. Oka; chemicals, engin., hydro-elec.; p. (1959) *133,000*.

Kalyan, *spt.*, Thana, Maharashtra, India; p. (1961) *73,482*.

Kama, *R.*, U.S.S.R.; trib. of R. Volga, which it joins S. of Kazan; length 1,400 m.

Kamaishi, *t.*, *spt.*, N.E. Honshu, Japan; serves Kamaishi–Sennin iron-ore field, lgst. worked deposits and reserves in Japan; impt. iron and steel ind.; p. (1947) *26,200*.

Kamakura, *t.*, Honshu, Japan; on shore of Sagami Bay; tourism; p. (1965) *118,329*.

Kamaran I., Red Sea; Southern Yemen, formerly under Brit. occupation, 1915–67; a. 22 sq. m.; p. *c. 2,200*.

Kamchatka, *peninsula*, E. Siberia, U.S.S.R.; mtns. with volcanoes (Klyuchevsk, alt. 16,512 ft.); mineral wealth, fisheries on cst., climate cold, wet and foggy; cap. Petropavlovsk.

Kamenets Podolski, *t.*, Ukrainian S.S.R.; brewing, tobacco; p. (1956) *33,000*.

Kamensk-Shakhtinskiy, *t.*, R.S.F.S.R.; on R. Severskiy Donets; coal-mng., engin., artificial fibres; p. (1959) *58,500*.

Kamensk Uralsk, *t.*, R.S.F.S.R.; aluminium, iron, steel, engin.; p. (1959) *141,000*.

Kamet, *mtn.*, N. Garhwal dist., Himalayas; alt. 25,477 ft.; until 1953 (Everest) highest mtn. climbed (Smythe, 1931).

Kamloops, *c.*, B.C., Canada; on Thompson R. formerly Fort Thompson; in "Wild West" area; on transcontinental rlys.; supply ctr. for mining and grazing dist.; p. (1961) *10,076*.

Kampala, *cap.*, Uganda, E. Africa; univ. coll.; ch. comm. ctr.; lt. inds.; p. (1959) *46,730*.

Kampar, *t.*, Perak, Malaysia; p. *17,449*.

Kampen, *t.*, Overijssel, Netherlands; on R. IJssel; cigar mkg.; p. (1967) *28,942*.

Kamp-Lintfort, *t.*, N. Rhine–Westphalia, Germany; Cistercian abbey; coal-mng.; p. (1963) *35,900*.

Kampot, *prov.*; Cambodia; pepper; cement plant at Chakrey Ting; p. (1962) *337,879*.

Kamyshin, *mftg. t.*, R.S.F.S.R.; on R. Volga; textiles; mkt. gardening, grain; p. (1959) *55,000*.

Kan, *R.*, S. China; rises in Nan Shan, flows N. into L. Poyang; valley provides route for main road from Kiangsi prov. to Kwangtung prov. over Meiling Pass.

Kanawha, *R.*, W. Va., U.S.A.; rises in Allegheny Mtns., flows S.W. to Hinton, then turns N.W. across Allegheny Plateau into R. Ohio; lower course runs through ch. mining a. of W. Va. coalfield nr. Charleston; length 350 m. approx.

Kanazawa, *t.*, Kaga, Honshu, Japan; silks, ceramics, lacquer ware; p. (1965) *335,828*.

Kanchenjunga, *mtn.*, on Nepal–Sikkim bdy., N.E. India; 3rd highest mtn. in world; alt. 28,146 ft.

Kandahar, *prov.*, S. Afghanistan; mountainous; cap. K.; p. (1948) *1,063,496*.

Kandahar, *c.*, former cap., Afghanistan; alt. 3,400 ft.; 370 m. from Herat; linked by road to Kushka (Turkmenia) via Herat; p. (estd. 1964) *115,000*.

Kandy, *t.*, Ceylon; in ctr. of I., 75 m. from Colombo at alt. 3,000 ft.; resort in hot season; tea and cocoa; p. (1963) *67,768*.

Kangaroo I., S. Australia; eucalyptus.

Kankakee, *t.*, Ill., U.S.A.; farm implements; machin.; p. (1960) *27,666*.

Kano, *c.*, N. Nigeria, W. Africa; gr. emporium for the whole Sudan region; impt. airport and rly. terminus; p. (1953) *130,000*.

Kanpur, *t.*, Uttar Pradesh, India; fertilisers.

Kansas, *st.*, U.S.A.; called the "Sunflower State"; prairie; farming, maize, wheat; cattle, dairying, pigs; coal, petroleum, natural gas, lead, meat-packing, flour-milling, aircraft, chemicals, machin.; cap. Topeka; a. 82,276 sq. m.; p. (1960) *2,178,611*.

Kansas City, Mo., U.S.A.; on right bank of R. Missouri; univ.; gr. livestock mart., car and aircraft assembly, steel, metal; meat pkg., food processing; p. (1960) *475,539*, adjoins Kansas City, Kansas; p. (1960) *121,901*.

Kansk, *t.*, R.S.F.S.R., on Trans-Siberian Rly.; ctr. of industl. a.; textiles, wood-working; p. (1959) *74,000*.

Kansu (Gansu), *prov.*, N. China; bordering Inner Mongolia; cap. Lanchow; wheat, cotton, tobacco; livestock; mineral resources; a. 151,161 sq. m.; p. (1953) *12,928,102*.

Kant, *t.*, Kirgiz S.S.R.; 12 m. E. of Frunze; to be expanded to industl. c.; proposed p. *100,000*.

Kaohsiung, *spt.*, Taiwan; on S.W. cst.; exp. rice, sugar; oil refining, aviation spirit, diesel oil; p. (1962) *276,000*.

Kapfenberg, *commune*, Austria; iron, chemicals, paper; resort; p. (1961) *23,859*.

Kaposvar, *t.*, Hungary; textiles; p. (1962) *45,054*.

Kara-Bogaz, *lge. G.* on E. cst. of Caspian Sea, Turkmen S.S.R.; very high salinity, impt. deposits of Glauber's salt used in local chemical ind.; a. 7,000 sq. m. [p. (1965) *47,660*.

Karabuk, *t.*, Turkey; N. of Ankara; steel wks.;

Karachi, Fed. Terr. of, *div.*, W. Pakistan, on the Indus delta; univ.; spt., air ctr.; oil refining; industl. gases; steel mill; natural gas from Sui; nuclear power sta. under construction; a. 8,400 sq. m., p. (1961) *2,153,000*.

Karaganda, *t.*, Kazakh S.S.R.; town built on impt. coalfield; engin.; p. (1962) *459,000*.

Karakorum Mtns., Kashmir, India; on border with China; hgst peak Godwin-Austen.

Kara-Kum, *sand desert*, Turkmen S.S.R.; canal 510 m. long across desert completed 1962.

Kara Sea, Arctic Ocean; E. of Novaya Zemlya; navigation open July–Sept.

Karbala, *t.*, Iraq; N.W. of Hilla; ctr. of pilgrimage; sacred c. of Shiites; p. (1961) *219,015*.

Karcag, *t.*, E. Hungary; tortoiseshell goods; p. (1962) *25,787*.

Karelia A.S.S.R., U.S.S.R., incorporated into R.S.F.S.R. July '56; cap. Petrozavodsk; rich in timber, minerals, precious metals; a. 69,720 sq. m.; p. (1959) *649,000*.

Karen State, *see* **Kawthoolei**.

Kariba Dam, in Kariba gorge of Zambezi R., on Rhodesia–Zambia border; operated jointly by the two govts.; one of lgst dams in world with vast artificial lake supplying hydroelec. power to Rhodesia, Malawi, and the Copperbelt of Zambia; completed 1960.

Karikal, *former Fr. prov.*, united with India 1954; on E. cst.; p. (1961) *22,252*.

Karkonosze (Riesengebirge), *mtn. range*, between Polish Silesia and Bohemia; highest peak Sniezka (Schneekoppe), 5,275 ft.

Karl-Marx-Stadt, *t.*, Karl-Marx-Stadt, E. Germany; cottons, woollens, machin., cars, furniture, chemicals, engin.; p. (1963) *288,597*.

Karlovac, *t.*, Croatia, Jugoslavia; S.W. of Zagreb; chemicals; p. (1959) *30,000*.

Karlovy Vary, *t.*, *wat. pl.*, CSSR.; on R. Ohre; health resort; porcelain; p. (1961) *42,819*.

Karlshamn, *t.*, Sweden; oil refining, demagnetising sta.; p. (1961) *11,657*.

Karlskoga, *mkt. t.*, Sweden; E. of L. Vänern; armaments, iron and steel; p. (1961) *35,606*.

Karlskrona, *ch. naval sta.*, Sweden; on the S. cst.; lighting fixtures, china; p. (1961) *32,977*.

Karlsruhe, *t.*, Baden-Württemberg, Germany; chemicals, engin., elec., tobacco ind., oil refining; rly. junction; outport on Rhine; nuclear reactor projected (1957); oil pipeline to Lavera, nr. Marseilles, opened 1963; p. (1963) *249,500*.

Karlstad, *t.*, Sweden; on N. shore L. Vänern; ironwks. hy. engin., machin.; p. (1961) *43,064*.

Karnak, *vil.* Upper U.A.R.; on Nile, the site of ancient Thebes; ruined temples.

Karpathos, *I.*, Dodecanese, Greece; Mediterranean Sea; between Rhodes and Crete, p. *8,747.*

Karoos, Gr. and Little, extensive treeless plateau between mtn. ranges covered by scrub, W. Cape Prov., S. Africa.

Kars, *c.*, Turkey; woollens, carpets; p. (1965) *41,236.*

Karvina, *t.*, ČSSR.; coal, iron, chemicals; p. (1961) *46,842.*

Kasai, *R.*, Angola and Congo, Central Africa; rises in Bihé Plateau (Angola) and flows over 1,200 m. into R. Congo 120 m. above Kinshasa.

Kasanlik, *t.*, Central Bulgaria: captured from Turks at surrender of Sipka Pass 1878; famous for attar of roses; p. (1956) *30,934.*

Kashan, *c.*, Iran; Isfahan prov.; carpets, velvet; p. (1967) *153,986.* [R. Yarkand.

Kashgar, *R.*, E. Turkestan; flowing 500 m. to the

Kashing, *t.*, N. Chekiang, E. China; on Grand Canal; mkt. and tr. ctr.; p. *c. 86,000.*

Kashmir, *see* Jammu and Kashmir.

Kassala, *prov.*, Sudan; a. 134,450 sq. m.; p. (estd. 1951) *788,200.*

Kassel, *t.*, Hessen, Germany; on R. Fulda; cas.; iron, machin., cars, wood; route ctr.; p. (1963) *211,800.*

Kastamonu, *t.*, Karasu, Turkey; cap. of Turkish I. same name; great comm. ctr.; fruit, cotton, mohair; p. (1960) *19,450.* [*10,162.*

Kastoria, *t.*, N. Greece; E. of Vérroia; p. (1961)

Katanga, *prov.*, Congo; cap. Lubumbashi; copper, radium, uranium; cattle; a. 180,000 sq. m.; p. *1,178,029.*

Katmandu, *cap.*, Nepal; on Vishnumati R., 75 m. from Indian frontier; highway to Kodari; hydro-elec. sta.; p. (1961) *195,260.*

Kathiawar, *peninsula*, Gujarat, India.

Katoomba, *see* Blue Mountains.

Katowice, *prov.*, S. Poland; cap. K.; mng. and industl. a., drained by upper Vistula and upper Warta Rs.; a. 3,674 sq. m.; p. *3,253,000.*

Katowice, *c.*, S. Poland; ch. mng. and industl. ctr.; heavy machin., chemicals; p. (1965) *286,000.*

Katrine, Loch, S.W. Perth, Scot.; on R. Teith, 8 m. long; principal source of Glasgow water supply; beautiful scenery.

Kattegat, arm of North Sea linked with Baltic; separates Denmark (Jutland) from Sweden; 40–70 m. wide.

Katwijk, *t.*, Neth., S. Holland; on N. Sea, 15 m. from the Hague; resort; synthetic resins; p. (1967) *33,666.* [*28,176.*

Kauai, *I.*, Hawaiian Is.; a. 555 sq. m.; p. (1960)

Kaunas (Kovno), *t.*, Lithuanian S.S.R.; on R. Niemen; old-time cap.; univ.; metal goods, chemicals, textiles; hydro-elec. sta. under construction; p. (1959) *214,000.*

Kavalla, *prefecture*, Macedonia, Greece; ch. t. Kavalla; p. (1961) *140,445.*

Kavalla, *t.*, Kavalla, Greece; on Bay of Kavalla; gr. tobacco-preparing and exp. ctr.; p. (1961) *44,517.*

Kavaratti, *I.*, Laccadive, Minicoy and Amindivi Is., India; admin. ctr. of Union terr.; p. (1961) *2,828.*

Kawasaki, *c.*, Honshu, Japan; S. sub. of Tokyo; pilgrims; engin.; steel plate, petro-chemicals, synthetic resins, rubber; p. (1964) *789,000.*

Kawerau, *t.*, N.I., N.Z.; pulp and paper mill; (1961) *4,413.*

Kawthoolei, *div.*, Burma; former Karen st. extended to include areas in Tenasserim and Irrawaddy, inhabited by Karens.

Kayseri, *t.*, Turkey; S.E. of Ankara; p. (1965) *126,913.*

Kazakhstan, *constituent rep.*, U.S.S.R.; cap. Alma-Ata; steppe with stock-raising; lge. desert areas, being made fertile by irrigation; grain in N.; coal at Karaganda; asbestos at Dzhetygara; metaborite (richest boron mineral); minerals, oil; a. 1,072,797 sq. m.; p. (1959) *9,301,000.*

Kazan, *t.*, R.S.F.S.R.; impt. tr. ctr. for E. U.S.S.R., Turkestan Bokhara and Iran; cath., univ.; engin., chemicals, synthetic rubber, textiles, oil refining, paper; natural gas pipeline to Minnibayevo (Tatar A.S.S.R.); p. (1962) *711,000.*

Kazan Retto (Volcano Is.), *gr. of Is.*, Pac. Oc.; S. of Ogasawara Is, said of Japan.

Kazerun, *t.*, S.W. Iran; oranges, cotton, opium; p. (1956) *30,659.* [*17,417.*

Kunene (Cunene), *R.*, Angola; lower course forms bdy. between Angola and South-West Africa; *c.* 750 m.
Kungur, *t.*, R.S.F.S.R., S.E. Perm.; agr.; leather; kaolin; oil ind. equip.; p. (1959) *65,000.*
Kun Lun (Kwen Lun), *mtns.*, Tibet; extend 1,800 m. E. from Pamirs along N. edge of high plateau of Tibet; drained N. into inland drainage basin of Lop Nor; alt. frequently exceeds 18,000 ft.
Kunming, *c.*, Yunnan, China; univ.; comm. ctr.; [industl.; p. (1953) *699,000.*
Kununurra Dam, Ord R., W. Australia; opened 1963; to irrigate 200,000 acres of semi-arid land for cotton, rice, and cattle.
Kuopio, *dep.*, Finland; p. (1961) *270,504.*
Kuopio, *t.*, Finland; on L. Kalki; p. (1961) *44,740.*
Kur, *R.*, Transcaucasia, U.S.S.R.; flows to Caspian S.; length 520 m.
Kurdistan (Country of the Kurds), includes parts of E. Turkey, Soviet Armenia, N.E. Iraq, and N.W. Iran.
Kure, *c.*, S.W. Honshu, Japan; spt. and naval base; engin.; mnfs.; p. (1965) *225,013.*
Kurgan, *t.*, R.S.F.S.R.; on the Trans-Siberian Rly. nr. Tobolsk; tr. in cattle and foodstuffs, agr. engin.; p. (1959) *145,000.*
Kuria Muria Is., Muscat and Oman, off cst. of Oman, consisting of 5 barren islands.
Kuril Is., *chain of sm. Is.*, N. Pacific, U.S.S.R.; extending from Kamchatka to Hokkaido; mainly mtns.
Kurisches Haff (Kuršiu Martos), *shallow lagoon*, Baltic cst. of Lithuanian S.S.R., U.S.S.R.; receives water of R. Niemen; narrow entrance to Baltic Sea at N. end of lagoon commanded by pt. of Klaipeda (Memel); length, 60 m., maximum width, 20 m.
Kurische Nehrung, *sandspit*, Baltic Sea; almost cuts off Kurisches Haff from Baltic Sea; length, 55 m.
Kurnell, *t.*, Australia; oil refining.
Kuroshio (Japan Current), *ocean current*, flows N.E. along Pacific cst. of Kyushu, Shikoku and S. Honshu, relatively warm water, exerts slight warming influence on this cst. in winter.
Kushiro, *spt.*, S.E. Hokkaido, Japan; exp. lumber; p. (1965) *174,105.*
Kursk, *region*, adj. N. Ukraine, R.S.F.S.R.
Kursk, *t.*, R.S.F.S.R.; in fruit-growing dist., gr. annual fair; engin., textiles, synthetic rubber; p. (1959) *203,000.*
Kustanay, *t.*, Kazakh S.S.R.; on R. Tobol; light inds.; p. (1959) *86,000.*
Kustendil, *t.*, Bulgaria; on trib. of R. Struma; fruit-growing dist; p. (1956) *25,025.*
Kütahya, *t.*, W. Central Turkey; agr. market ctr., ceramics; p. (1965) *49,227.*
Kutaisi, *c.*, Georgian S.S.R.; on R. Rion; chemicals, textiles, barium, engin.; big coal deposits being mined; p. (1959) *128,000.*
Kutaradja, *t.*, N. Sumatra, Indonesia; p. (1958) [*20,976.*
Kutch, *peninsula*, N.W. cst., India, Gujarat st., largely barren except for fertile strip along Arabian Sea; p. (1961) *696,440.*
Kutch, Rann of, *desert region* covered with salt, but flooded during monsoons; nine-tenths belongs to India; one-tenth to Pakistan.
Kutchan, *t.*, S.W. Hokkaido, Japan; 45 m. N.W. of Muroran; ctr. of second lgst. iron-ore field in Japan; ore smelted at Muroran.
Kutno, *t.*, Lodz, Poland; p. (1965) *27,000.*
Kuwait, *indep. sov. st.*, Arabia; on N.W. cst. of Persian G.; sand, bricks; impt. oil wells, petrochem. ind. projected; p. (1961) *321,000.*
Kuzbas (Kuznetsk Basin), *industl. reg.* Siberia, U.S.S.R.; lies S. of Trans-Siberian Rly. in upper valleys of Rs. Ob and Tom; second lgst. coal output in U.S.S.R., iron and steel mftg., heavy metallurgical ind.; ch. ts., Novosibirsk, Novokuznetsk, Kemerovo, Leninsk-Kuznetsky.
Kwangchow, *spt.*, Kwantung, China; on S. cst. opposite Hainan I.
Kwangsi Chuang (Guang Zhuang), *aut. reg.*, China; cap. Nanning; sugar, tobacco, rice, indigo, silk; a. 85,452 sq. m.; p. (1953) *19,560,822.*
Kwangtung (Guangdong), *prov.*, China; cap. Canton; rice, tea, sugar, silk; a. 85,447 sq. m.; p. (1953) *34,770,059.*
Kwanto Plain, S.E. Honshu, Japan; lgst. a. of continuous lowland in Japan, extends 80 m. inland from Tokyo; composed of: (1) low, badly-drained alluvial plain devoted to intensive rice cultivation; (2) higher, drier terraces under mulberry, vegetables, tea, tobacco; very dense rural p., especially on lower ground; lge. number of urban ctrs., inc. Tokyo, Yokohama; a. 5,000 sq. m.
Kwan Tong, *t.*, Hong Kong; new industl. t. on E. [of Kowloon Bay.
Kwanza (Cuanza), *R.*, Angola, W. Africa; rises in Bihé and flows to Atlantic; length 700 m.
Kweichow (Guizhou), *prov.*, S.W. China; cap. Kweiyang; cereals, silk, timber, gold, silver, mercury; a. 68,139 sq. m.; p. (1953) *15,037,310.*
Kweilin (Guilin), *c.*, Kwangsi Chuang, China; univ.; textiles, sugar refining, timber; p. (1953) *145,000.*
Kweiyang (Guiynag), *c.*, Kweichow prov., China; univ.; comm. and industl.; p. (1953) *271,000.*
Kwidzyn (Marienwerder), *c.*, Poland, German before 1945; cath.; cas.; p. (1965) *22,000.*
Kwinana, *t.*, W. Australia; 12 m. from Fremantle on shores of Cockburn Sound; recent oil refinery and steel plant.
Kyle of Lochalsh, *vil.*, *sm. spt.*, Ross and Cromarty, Scot.; at entrance to Loch Alsh, facing S. end of I. of Skye; terminus of rly. across Highlands from Dingwall; ch. pt. for steamers to N.W. cst., I. of Skye, Outer Hebrides; p. (1951) *1,525.*
Kyles of Bute, *sound*, between Argyll cst. and N. [Bute, Scot.
Kymore, *t.*, Madhya Pradesh, India; nr. Katni; cement wks.; p. (1961) *12,319.*
Kyoto, *c.*, *cap.* Kyoto *prefecture*, Honshu, Japan; univ., temples; former cap. of Japan; p. (1965) *1,713,764.*
Kyrenia, *t.*, Cyprus; on N. cst.; p. (1960) *3,498.*
Kythera (Cerigo), *I.*, S. of Peloponnesos, Greece; a. 107 sq. m.
Kyushu, one of the lge. Is. of Japan; W. of Shikoku; mtns.; rice, wheat, tea, hemp, coal, copper; ch. t. Nagasaki; a. 16,247 sq. m.
Kyustendil, *t.*, Bulgaria; in foothills of Osogovo Mts.; lge lead and zinc deposits; combined plant for mng. and ore dressing projected.
Kzyl Orda, *R.*, Kazakh S.S.R.; large dam being constructed to irrigate rice plantations.

La Ceiba, *spt.*, Honduras; on Atlantic cst.; exp. bananas; p. (1961) *24,868.*
La Coruña, *prov.*, N.W. Spain; cap. La Coruña; oil refinery; a. 3,051 sq. m.; p. (1959) *1,010,695.*
